*NEW YORK, THURSDAY, JULY 1, 1875.*

## The Week.

ONE of the most extraordinary incidents in the Beecher case was Mr. Beach's commentary on the part played in it by Mr. Tracy, which is, we think, about the most remarkable example of that now common feat of "hating the sin and loving the sinner" we have met with in a long while. Mr. Beach accused Mr. Tracy in a formal and deliberate manner of having obtained from Tilton as his "chosen friend and counsellor" a "full and free communication of his secrets" with regard to this transaction, and of having afterwards "pledged his word and honor that he would not under any circumstances thereafter become the counsel of Henry Ward Beecher in antagonism to Theodore Tilton"; of having, in spite of this pledge, afterwards not only become Beecher's counsel, but offered himself while counsel as a witness against his former client. This, if true, Mr. Beach rightly characterizes as an exhibition of "professional treachery and personal dishonor." On hearing these assertions made in this solemn manner in open court, one would naturally conclude that Mr. Beach would not only hold no further intercourse, either personal or professional, with Tracy, but that he would make some attempt in the interest of public morality to get him disbarred, and to drive him out of decent society. This is certainly what lawyers of Mr. Beach's standing used to do under such circumstances in old times at this bar, and it is what they do still at the bars of other civilized nations. But Mr. Beach does not mean to do anything of the kind. On the contrary, he opened his attack on Tracy in the regular Brooklyn fashion, by telling him "that he had no feeling for him but one of the utmost kindness"; "that he said nothing about this matter from any unfriendliness or any desire to injure his feelings"; that "his relations with him had been entirely cordial, and that nothing that had happened or should happen in that case would interrupt that friendliness of sentiment"; and that "what he (Tracy) had done would not diminish the feeling that he (Beach) had hitherto entertained for that gentleman"; and that "he trusted nothing he should say would embitter the sentiment of that gentleman (Tracy) towards himself." There is of course a Pickwickianism which is funny and harmless, but Pickwickianism of this sort on such an occasion is not only repulsive but mischievous. Why should Tracy or anybody else not commit "professional treachery and personal dishonor" if he is not to suffer for it either in pocket or in social relations?

---

The fact seems to be that Mr. Beach, while thundering against Brooklyn notions of morality and social relations, is himself in the gall of bitterness and the bond of iniquity. One of the peculiarities of chromo-civilization is that it makes no distinctions between persons, holding that one man or woman who weeps and prays and sings is just as good as another, and that it does not make much, if any, difference what your course of life has been or is, provided you "feel kindly" towards people and do not allow things to "embitter your sentiments." Consequently, a chromo-civilized Christian is quite capable of making a speech of this kind to a brother man: "You have, my dear sir, committed every offence which it is in the least worth your while to commit; you have betrayed your clients and wards; you have wasted the substance of the poor; you have broken your word of honor to your friends, and have perjured yourself in courts of justice. I would not trust you alone in the room with a silver spoon, and believe you would take a brief from the devil himself if he made your fee large enough. Now, I hate these offences deeply. I think no man ought to commit them. I believe God disapproves of them in a mild way, but trust this expression of my opinion will not hurt your feelings. In fact, I only make it because I find that Pothier, the renowned jurist, Hugo Grotius, the Apostle Paul, and Dr. Lieber have given utterance to similar sentiments in several of their great works, as you know, doubtless, as well as I. Towards you personally, my dear old cultured friend, I need hardly say my feelings are entirely unchanged. I love you as I have always loved you. Whenever you feel wearied with your frauds and adulteries and lies, you know you are welcome to my fireside. Come near to me, that I may get my arm around your neck, and lend me your pocket-handkerchief, and sit down while I send out for a 'floral tribute.'"

---

The railroad statistics for the year 1874 have appeared during the week, and they show a result at variance with the common notion that railroad business was more unprofitable than any other. The gross earnings of the 69,273 miles of road in the country were $520,466,016, and the net earnings $189,570,958; the gross earnings in 1873, when the mileage was 66,237, were $526,419,935, while the net earnings were only $183,810,562. These figures show that the reduction in the cost of materials and labor more than compensated the loss in total receipts. The total amount invested in railroads in this country is $4,221,763,594, or more than double that in the securities of the United States Government. The construction of new roads during the year amounted to only 1,940 miles, or less than one-third the average of the preceding five years. This check to the too rapid expansion of the railroad system is an encouraging sign for all railroad property. With the population of the country increasing at the rate of about one million per year, it is clear that within a comparatively short time every railroad which was judiciously laid out will become, with proper management, good property. The tonnage in 1874 exceeded that of previous years, and shows that the general complaints of dulness in trade were not well founded. The dividends paid in 1873 were $67,042,942; in 1874, $67,120,709. The statistics with regard to the Western and Southern States will not greatly encourage the Grangers, for in the former the net earnings equalled 3.8 per cent. of the cost, while the dividends paid amounted to 1.92 per cent. on the stock; in the latter the net earnings were 3.3 per cent. on the cost, and the dividends paid amounted to one-half of one per cent. on the capital stock.

---

The Chicago *Tribune* complains of our recent treatment of Judge Dillon, apropos of his decision touching the Iowa railroad law, and maintains that we did him injustice both in our account of the two decisions which we alleged to be contradictory, and in the strictures which we based on them. Now, we venture to repeat again that the two decisions are diametrically opposed to each other, and that it was owing to an oversight that the first one was not cited at the bar in the recent argument. The distinction the *Tribune* thinks it sees, amounts to nothing even if it exists. We had not intended, however, by anything we said to cast any imputation on Judge Dillon's motives. What we said was—and to this we adhere—that foreign investors who do not know him will see in his giving two decisions, each of which has happened to favor a cheating process on the part of the State, reasons for doubting his purity, particularly in view of the tricks the Grangers have recently been playing with the judges in more than one State; and that American credit of all kinds will, therefore, suffer through his course. This will doubtless be unjust, but that it will happen we have no doubt whatever. We believe, in fact, that the material development of the West is likely to be seriously retarded by the growing suspicion of the honesty of the people as indicated by their course towards their creditors, and by the conduct of the judicial bench with regard to exciting public questions; and it is right that it should be so. This is the way the world is governed and the knaves prevented from permanently getting the upper hand.

There have been no further failures of importance in London, and the uneasy feeling which existed there has passed away. The Bank of England continues to gain steadily in its bullion account, the increase in the past ten days having been larger than in any like time for several years. The gold shipments from here were checked early in the week because of the absolute scarcity of the metal, but have been renewed since the Treasury began the prepayment without rebate of the July interest. There has been a good demand for first-class securities here and in Europe; the Syndicate find ready purchasers in Europe for the new United States five per cent. funding bonds, and they have accordingly been able to request Mr. Bristow to call in $5,000,000 more five-twenty six per cents., which he did on Saturday. They now expect to take the entire remainder of the new fives within the time limited by their contract. The New York banks report only $8,850,000 gold, against $19,700,000 last year and $27,660,000 in 1873. This weakness in coin reserve would be alarming to the money market were it not that the banks hold such a large amount of legal-tender notes—$71,500,000, a good part of which has been obtained by forwarding to Washington for redemption national-bank notes sent here for deposit during the summer. It is worthy of note that a more cheerful feeling prevails among business men. From all sections the reports in regard to the crops and business prospects are encouraging. This improved feeling has been more or less reflected at the Stock Exchange, where shares have advanced.

---

The reports of the army officers, made through General Pope, on the condition of the Indians at the agencies, which so far confirmed Professor Marsh's charges, have received further corroboration from the report of General Miles on the operations of the troops against the hostile Indians in the Department of the Missouri during the past year. He discusses at the close the causes of these outbreaks and the best means of preventing them. He condemns, in the first place, in the strongest terms the practice of collecting thousands of savages on remote reservations, under no control "except that of one or two individuals, beyond or on the verge of civilization," where they are not only cut off from the only occupations they respect or have been trained to—murder and pillage—but live in complete idleness. No civilizing process is therefore going on among them, and they are in the meantime allowed to provide themselves with the most improved weapons. They are consequently always ready for an outbreak, but the immediate provocation, General Miles says, usually comes from the fact that, though the Government undertakes to support them on the reservation, "the provisions given them are insufficient to satisfy their wants." "They have been," he says, "for weeks without their bread-ration, and their year's allowance of food is exhausted in six or seven months; thus they are half-starved or half-fed," and "become dissatisfied or hostile." He therefore suggests that they should be disarmed and dismounted, and placed under some government strong enough to command their respect, instead of solitary agents selected by missionary societies, (and forced to betake themselves to pastoral pursuits,) for which they are well fitted, and which would not involve such a violent transition as their conversion into agriculturists. At any rate, the scandals of the present system have gone so far as to call for some radical remedy. There is now talk at Washington of the transfer of the whole business of feeding the Indians to the War Department, which would doubtless secure the honest distribution of the supplies; but then the process of pauperizing the Indians would still go on, and nothing can be worse than this. We cannot elevate savages or anybody else by feeding them for nothing. Men are elevated by working for their living and enjoying in security the fruits of their toil.

---

The "People's Independent Party" in California has held a convention and adopted what we believe to be the longest platform on record. It contains thirty-six planks, and leaves very few subjects of legislation untouched, besides making several excursions into the region of pure morals. It rejoices over the subsidence of the passions of the war; denounces both the national parties in California; cuts out work for the Independent party, which includes the establishment of a perfect State government; forms a league between the cities on the coast and the counties of the interior; denounces railroad corporations, and gives up all hope of relief from their extortion through competition; proclaims the right of the State to regulate charges; demands a transcontinental railroad, to be managed by the pure and good; proclaims the supremacy of the public over lakes and rivers; denounces local water and gas companies; bewails the cost of the State government; calls for a reduction of special salaries; demands perfect equality in taxation, and calls on assessors to be just; criticises the grand juries; repudiates strict party discipline; and declares that this movement has nothing to do with the Presidential contest of next year. There is a good deal that is good in the platform, but it is safe to say that a party which seeks to accomplish so much, and that much of such a lofty character, cannot expect to accomplish a great deal. No party can regenerate either the whole earth or any one State, and there is no use in any party taking its stand on the Ten Commandments; for it will find nobody to offer what a reform party most needs—direct opposition. The reform parties which are now springing up all over the country in fact attempt too much, and often illustrate the proverb about the nearness of the sublime to the ridiculous.

---

The Cincinnati *Commercial* has been making an amusing exposure of the "record" of General S. F. Cary, the Democratic candidate for Lieutenant-Governor in Ohio. One of the planks of the platform declares the opposition of the party to "what are called sumptuary laws," or any "interference with the social habits or customs not in themselves criminal," and denounces "any espionage by one class of citizens upon another." On this platform General Cary now stands, and asks for the votes of the liquor-sellers. Unfortunately, however, the *Commercial* has discovered that in 1849 this same General Cary was a temperance orator and writer, and in that capacity composed one or two thoughtful tracts upon the subject, which were published by the National Division of the Sons of Temperance. In these tracts the General declares that the manufacture and sale of liquor is a crime against society, and demands that it shall be "incorporated in the same catalogue with the highest crimes known to the law." The great hope of his life is, he says, "to induce the sovereigns of this land—the people—to wrest from the hands of intemperance and its coadjutors—the liquor-sellers—the power of the law, and turn it upon the adversary." The question of sumptuary laws he settles by declaring that it is the province of government to guard the property, health, reputation, and lives of its citizens; that the traffic in liquors impoverishes a people, impairs their health, destroys their characters and reputations and also their lives, and therefore comes clearly within the proper reach of the criminal law. "If an individual," he continues, "recklessly discharge a cannon in the crowded streets of a city, and mow down indiscriminately men, women, and children, it would be no excuse that he did not intend to injure anybody." So with the liquor-seller, *malice*, in a legal sense, is *implied* by the very nature of his act, and, on the whole, the General does not see how the rumsellers can escape being regarded as "outlaws."

---

The case of William Allen, candidate for re-election as Governor, is quite as bad. Mr. Allen's speeches when in the Senate have been unearthed, and it seems that on every occasion he was in the habit of denouncing paper-money in unmeasured terms, declaring, for instance, that "privilege, paper, and oppression stand arrayed on the one side, against liberty, labor, and property on the other." On the 31st of December, 1838, he offered a resolution "that those legal provisions by which the Government was originally required, in the transaction of its own affairs, to receive and to tender in payment as money nothing but that which is made a legal tender by the Constitution, ought to be revived, with those modifications only, as to time and proportion, suggested by the present

condition of the country." To make the whole thing complete, it need only be added that this was immediately after the panic of 1837, and that Mr. Allen's economical studies then enabled him to trace all the disasters of the time to one thing—an unlimited issue of paper-money. As showing how prolonged study may modify the deepest thinker's views, it is interesting to observe that Mr. Allen proposes as the panacea for financial panics in 1875 what he erroneously thought in 1838 was their cause.

The opposition to Tammany has spent the last few days in organizing a new party in the interest of the "Short-Hairs," but without much chance of success. There is, to be sure, a great deal of dissatisfaction in the party with its leaders, as there always is as soon as the patronage is pretty well distributed, and numbers of the faithful men who have sacrificed themselves to the party discover that there is no chance of their reaping their reward, and besides this there is the dissatisfaction of the laborers with the reduction of wages; but, on the other side, there is the immense obstacle, that Governor Tilden and John Kelly and their friends have really got possession of the machine; that the machine represents now an unusual amount of wealth, respectability, and consequent independence; and that any bold attempt to strike the city treasury would probably bring out a heavy vote against the strikers. So long as the control of the party by Mr. Tilden and his friends means a saving of two or three millions in a single year by vetoes alone, they may certainly count on a good deal of support of the non-political sort. However, the present movement is not so much one directed immediately against the city as it is against Tammany itself, and it is rather "reform within the party" that the reformers want than the formation of a permanently opposing or even parasitic faction. "Reform within the party" of course, in this case, means the removal of General Porter and one or two other insufficiently magnetic persons, and filling their places with one or two friends of the "boys."

Some of the newspapers a short time ago discussed with a good deal of warmth the propriety of the erection of a Musical College in Central Park in this city. The signing of the bill by the Governor will, it is to be hoped, tend toward the clearing up of the awful mystery which surrounds the whole project. Of course, if the donor or promoter wishes to keep his name in obscurity, he is entitled to do so; but there is something very stimulating to public curiosity in the news of a proposition to present the public of New York with what must be the largest fund ever dedicated to music by any private person. The controversy which has been going on in the newspapers seems almost insignificant compared with the importance of knowing what the real facts are about the origin and purpose of the gift itself. There is no doubt that the offer has been made, and that trustees of respectable standing have undertaken the duty of carrying out the founder's plan. But what is the plan, and can it be carried out? With three or five millions, which are the modest sums generally mentioned in connection with the enterprise, a whole people might almost be made musical; and if these sums are dedicated not merely to instruction, but to amusement as well, we might have concerts in the Central Park which should do for the public at large what Thomas now does for a small part of it. The want of summer amusements for the city is one of its great defects, and anything which tends to increase their number must be looked upon as a benefaction.

On the 8th of last month Mr. Schurz received at Berlin a gratifying tribute like that which signalized his departure from this country. Among the prominent Americans present at a dinner given in his honor were Dr. J. P. Thompson, the presiding officer, and Prof. W. D. Whitney, while Dr. Friedrich Kapp may be said to have represented the German-Americans; Mommsen, Virchow, Gneist, and other professors, the universities; and Von Benningsen, Speaker of the Prussian House, Von Bernuth, vice-president of the House of Lords, and Rösing, formerly consul-general in this city, the Liberal party of Germany. Mr. Schurz's remarks, spoken in two languages, were brief and impersonal, and were devoted to showing the natural and indeed actual sympathy of the people of the United States with that of Germany, and the absence of any conflicting interests between them. In urging a reciprocal regard on the part of the Germans, it was of course necessary to look in the face the fact of our country's declining reputation abroad since the war, owing partly to rascality by which foreigners have suffered heavily, and partly to the free exposure of its vices by its own press and public men in their efforts to bring about a better state of things. This part of Mr. Schurz's speech was marked by his usual tact and delicacy, and it is certain that no other of our public men, had he stood in Mr. Schurz's place, could with the same grace and effectiveness have maintained the substantial soundness of the American character. On the other hand, there is scarcely a leader of that party which has heaped contumely upon Mr. Schurz as a renegade, from whom such a defence of his own countrymen before a German audience would not have seemed both impudent and ridiculous.

The Attorney-General has given an opinion on German-American citizenship which is of considerable interest. In 1848, one Steinkauler, a Prussian subject, emigrated to this country, and in 1854 was naturalized. In 1855, he had a son born in St. Louis, and four years later he took back his family, including this son, to Germany, where he has ever since continuously resided at Wiesbaden. In 1866, Wiesbaden came under the North German Confederation, and the son, who is now twenty years of age, has been called upon by the German Government for military duty. Mr. Steinkauler invoked the aid of the United States Legation at Berlin, on the ground that his son was a native-born American citizen. On this application, Mr. Bancroft Davis enquired whether the son would give an assurance of intention to return to America within any reasonable time and resume the duties of a citizen; but the father declined to give any such assurance. On this state of facts the Attorney-General says that there is no reason for any interference of the Government; that the naturalization treaty of 1868 between North Germany and the United States provides that "if a German, naturalized in America, renews his residence in North Germany without the intent to return to America, he shall be held to have renounced his naturalization in the United States," and that the intent not to return may be inferred from a residence of more than two years in the other country. Under this treaty, according to the Attorney-General, Steinkauler the father abandoned his American citizenship and became a German subject, and thus "by virtue of German laws the son acquired German nationality." But it is "equally clear," he continues, that the son "by birth has American nationality," and hence "he has two nationalities, one natural, the other acquired." Again, "there is no law of the United States under which his father or any other person can deprive him of his birthright." More than this, young Steinkauler "can return to America at the age of twenty-one, and in due time, if the people elect, he can become President of the United States"; but at the same time, the son, "being domiciled with the father and subject to him under the law during his minority, and receiving the German protection, where he has an acquired nationality," and declining to give any assurance of his intention to return and assume the duties of an American citizen, the Attorney-General decides that he is not entitled to the protection of our Government. The status, then, in law of a German uhlan, say of the age of twenty, who is mustered into the German service for a period necessarily fixed by German laws and perhaps not terminating till he is thirty, but who, nevertheless, has by birthright a sort of inchoate American citizenship, which on the day he becomes of age ripens into a full citizenship, entitles him to desert the German army, come home, and run for his State legislature. This is rather difficult for the mind to grasp, and in the case of a war between the two countries would be apt to lead to remarkable consequences. If such is the law, it would seem to need revision.

## THE "SHORT-HAIRS" AND THE TAXPAYERS.

THE contest now raging between the "Short-Hairs" and the "Swallow-Tails" upon the question of the rate of wages paid to laborers employed by the city, though many people will turn from it with disgust as a mere politicians' fight, is one of very great interest to the inhabitants, not only of this city but of all large cities. On the surface, it seems a small matter—viz., whether the city shall pay its laborers a dollar and a half or two dollars a day—and the difference would probably in the course of the year be a comparatively small proportion of the taxes. But then the principle involved is of enormous importance, as the taxpayers will find out before very many years, if they do not see to it that the matter is now settled in the right way once for all. The "Swallow-Tails," strange to say, and the Department of Public Works which they control, are desirous of dealing with the question of wages on economical grounds—that is, of paying persons employed by the city the rate of wages paid by private employers, or, in other words, the rate fixed by the action of demand and supply in the markets. The "Short-Hairs," however, headed by John Morrissey, the ex-pugilist, and with more or less countenance from more respectable opponents of John Kelly, insist upon it that the city should pay not what labor can be got for, but what the laborers consider a reasonable sum, on the ground that the city is something different from and higher than a body of taxpayers executing certain works in concert for the common benefit, and that, therefore, it ought to be governed by other than business considerations; and they announce their intention of voting against all officials who support or connive at the payment of the market rate.

It ought to be observed, in the first place, that, as we pointed out a fortnight ago, the ease with which employment is obtained in the city, and the exemption from the rigorous enforcement of the ordinary penalties for idleness or incompetency which city laborers enjoy, has had the effect of drawing to this point large bodies of shiftless persons from all parts of the country, whose presence here would be dangerous and undesirable even if they were not voters, and did not obtain the power very speedily after their arrival of drawing large appropriations of money for their own benefit out of the pockets of the citizens whom they find engaged here in trade, commerce, and manufactures. It is no injustice to say, therefore, that the laborers now employed by the city are, for the most part, an inferior body of men, both morally and physically, whom it is a gross injustice to pamper or protect or in any manner encourage out of the public treasury. Instead of deserving more consideration than other people, they deserve less. It must be borne in mind, also, that such inducements as have been offered them hitherto have been offered them, so to speak, on the sly. That is, the city politicians have *pretended* to pay the market rate of wages, and to employ and dismiss men on the same conditions as other employers. In reality, they have not done so. For a long time they have paid more than the market rate, and have used their patronage simply to reward political support, but they have not made public announcement of the fact. The drift of good-for-nothings into the municipal works has therefore had the outward marks of an abuse which the perpetrators either tried to disguise or kept silent about. When, therefore, their demands on the taxpayers have reached their present height under existing circumstances, we may guess what they will be when the comfort of lazy and bad workmen is openly proclaimed as one of the objects of municipal government.

This is what is now sought by the "Short-Hairs." They wish to have the right of the city officials to pay such wages as they please, without regard to the market rate—or, in other words, to distribute every year an enormous sum in charity to persons selected by themselves, and without control or accountability—formally and publicly recognized. The difference between what they can get labor for, and what they pay for it, is of course charity. It may be called "wages," or any other name you please, but its character remains the same. In paying it, the city officers are giving away the money of the taxpayers without any check, because the accounts of an officer who may pay what he pleases in wages are absolutely valueless. They will tell you how much has been spent, but they tell nothing as to whether it has been well and properly and necessarily spent. In fact, absolute discretion as to the rate of wages might in practice, and in the hands of persons even half as audacious as Tweed and Sweeny, amount to complete control of the appropriations for certain important portions of the municipal expenditure. The phrase, "sufficient to keep a workingman and his family in comfort," which the "Short-Hairs" propose to substitute for "market value," has nothing in the least definite about it, and may be, and probably would be, construed with the widest variety of interpretation. If the city laborers once found that their officers had complete discretion in the matter, they would doubtless change their standard of living very rapidly, and would probably decide before long that an American citizen working for the public, even in the humble duty of excavating or carrying hods, ought to have ten dollars a day. In fact, if the proposed rate of payment were once adopted, attempts to keep down taxation and to prevent the gradual confiscation of the property of the taxpayer would rapidly become farcical in their futility. The taxpayers could not escape by suspending the works and discharging the laborers, because the very same arguments which are used in defence of paying them more than they are worth in the market, would be used with still greater force to prevent their dismissal. If the city is bound to pay men what *they* think is sufficient to maintain them in comfort, it is *à fortiori* bound not to let them starve. In fact, from the duty of purchasing labor at a fancy price to the duty of purchasing it whether you want it or not, there is only one short step; and any body of voters which successfully insists on either in this city will be reinforced so rapidly from other places that the wages of city laborers will rise in the direct ratio of the increase in the number of laborers, and the economists be thus covered with confusion, and "the pauper labor of Europe," to which amusing reference was made at the laborers' meeting the other day, be thus once more brought into greater disrepute than ever. In fact, the word "pauper" is in the hands of some of our economists and agitators rapidly losing its original meaning. It used to signify a person who could not or would not sell his labor for enough to support him. It now begins to mean a person who cannot procure legislation for forcing people to buy his labor whether they need it or not.

Another point in this "Short-Hair" movement to which we wish to direct the earnest attention of municipal taxpayers, is the fact that it is an attempt to introduce into American politics a delusion which has been and is now the curse of the European continent, and which, while declining under the influence of bitter experience in France, begins to gain strength in Germany through the labors of a new school of professorial economists—the notion that the government either of a city or state is something different from, and superior to, the people who support it. The great safeguard of American institutions—the reason why free government has succeeded here and has failed in most other countries—is that no hallucination on this point has yet taken possession of the public mind. It has not been possible by any trick or juggle to persuade people that the money in the Treasury to-day is other than the money they had themselves given the tax-gatherer yesterday, or that the officers of the Government had any peculiar sources of wisdom or knowledge, or any powers or capacities, not attainable by their fellow-citizens. So that there has been no time when it was possible here for a man to get up, without being more or less laughed at, and talk of "the state" as a glorious, beneficent, and all-powerful being, whose duty it is not only to execute the laws, but instruct, enlighten, and relieve the people. Everybody here knows that when Smith becomes governor he is no wiser than before his election, and that when he and the legislature get together, their united wisdom is about as great as the wisdom of each of them, and is not the result of any chemical change, making a new or peculiar faculty, which qualifies them to instruct the private citizen how to manage his affairs, or to raise their management of the public funds above criticism. Nothing could be more dangerous or disastrous than to have this robust and healthy view of the relations of ruler and ruled supplanted by the mystic folly of the German

professors and French Reds, which makes the State a kind of Providence. On this point it is impossible to overestimate the value of the training of the town governments. If you told a New England farmer that the town could afford or was bound to pay more for labor than the individual taxpayers could afford or were bound to pay, or that the town was a mighty and munificent entity, whose purse ought to be ever open, and which should never haggle in its bargains, he would be greatly amused. There is nothing in the constitution of a city to make the responsibilities of its officers with regard to money different from those of a town's officers. The city is simply a body of taxpayers. It can afford what the taxpayers can afford, and no more. Its duties to the poor are what theirs are. The great maxims of prudence and morality applicable to the conduct of private affairs are applicable to its affairs. Giving away its money for any purpose whatever, unnecessarily, or without authorization, is stealing from a large number of private citizens, nearly all of whom are persons of small means, struggling with difficulty from year to year to make ends meet. All payments to "Short-Hair" voters, therefore, of more than their labor is worth, are simply frauds upon persons almost as poor, but honester and more industrious, and the efforts that are now being made to disguise them ought to be sternly repressed. In fact, the charter ought to provide some cheap and simple process by which any taxpayer could call to account any department guilty, as nearly all the departments now are, of the dishonest use of the public money, in giving bonuses to the lazy and undeserving persons who crowd into the service of the city, simply because they are either too lazy or too tricky or too disreputable to secure employment from private citizens.

## THE EUROPEAN ARMAMENTS.

ONE of the most striking features in the political discussions now going on in Europe is that the principal question of interest is the military question, and England does not furnish an exception to the rule; and what makes this all the more remarkable is that this interest in military matters is accompanied by wonderful commercial activity. Capital, machinery, railroads, steamboats, telegraphs, new lines of communication, are accumulating with extraordinary rapidity, and the financial interdependence of nations, through the growth of national debts and the investment of capital in foreign enterprises, is every day becoming greater and greater, so that the shock to credit of even the sign of a war bids fair in a few years to be tremendous. Yet the amount of money, labor, and thought put into preparation for war was never anything like so great in proportion to the national resources as it is at this moment. The arts of war, in fact, receive now in every great nation in Europe an amount of positive encouragement such as has never been anywhere bestowed on those of peace. Its professors are honored above men in any other walk of life; enormous rewards of the most attractive kind are offered to them for improvements of every kind in their calling, and a considerable portion of the national revenue is devoted every year to enabling them to make experiments. Besides this, almost the entire able-bodied male population is passing in some way or other into the army, and the existence of armies constituted in this way is a constant menace to peace. In England, the volunteer system is at this moment the subject of constant complaints, and people are beginning, not exactly to think of resorting to conscription, but to contemplate the possibility of having to abandon their old volunteer system for some other better suited to a possible conflict with one of the great Continental powers, or, more accurately, to the possible necessity of interference in Continental quarrels. It is admitted on all hands that the English army as at present constituted would be completely unable to participate in any European conflict, and would, indeed, be unable to furnish an auxiliary force worthy of notice to any Continental ally.

The change in the conditions of European warfare which has reduced her to this condition may be said to have taken place within twenty years, and they are worth studying as one of the results of recent industrial progress. Ever since the Revolution of 1688, England has been able to make a respectable figure in all the great Continental wars—that is, she was always able to despatch a force of Englishmen, Scotchmen, or Irishmen to the Continent, and able, with the assistance of such auxiliaries as she was able to secure by diplomacy or pay, to hold her own against anything which the greatest military power of the day could send against it. Her armies were the first to cow Louis XIV., and during his reign and that of his successor brought the French monarchy to the brink of ruin by a succession of victories. After its overthrow and the rise of Napoleon, she sent a sufficiently large force to Spain to check the progress of his arms in that quarter, and finally, with such assistance as the Spaniards could give, to drive him out of the country, and the following year confronted the whole French army for a whole day at Waterloo, and came out of the struggle with the reputation of being the first military power in the world. In 1853, too, she was able to send a force to the Crimea which, if it had been properly commanded and organized, would, without difficulty, have borne at least half the brunt of the war to the end, and indeed, as a matter of fact, mustered in much larger numbers at the close than at the beginning. She could, however, not only play no such part now in a Continental war, but she could not play any part at all that would not be mortifying to the national pride. As wars are waged in our day, the contingent she sent to Spain or the Crimea would hardly exert an appreciable effect on the fortunes of a struggle between any two great powers. A small detachment from the armies which Russia or Austria or Germany or France sends into the field would suffice to hold it in check. Besides this, the system of subsidies in money by which she exerted so much influence on Continental politics could no longer be resorted to, and for the simple reason that money will not now go nearly as far in military preparations as it did in the beginning of the century. Armies cost vastly more per man, and they contain more men, and though the wealth of England has increased prodigiously within the last fifty years, it has not increased in anything like the ratio of the expense of armament. "Le monstre Pitt avec ses guinées anglaises" who weighed so heavily on the French imagination during the war of the Revolution, and who was supposed to pay all the enemies of the Republic liberally, would find his money-bags in our time almost ridiculous.

This great change is due largely, of course, to the growth of revenues and population, but it is due mainly to the wonderful increase in the means of transportation. It is the railroads and steamers which have called great armies into existence, by making it possible to concentrate them rapidly. Great blows can now be struck in a fortnight with three or four hundred thousand men, and these can be kept together within one-tenth part of the space in which Napoleon could have kept them, because they can draw their subsistence from great distances. In short, the military systems of modern countries have been adapted to their industrial systems; and to ask countries like France or Germany now not to use their force in numbers in warfare, would be much the same thing as asking them not to use their skill in making rifles or cannon or steam-engines. They are only doing what they have always done—viz., getting as many men into the field as they can transport and maintain.

That there is any near probability of the disuse of great armies we presume very few thinking men not immediately engaged in the advocacy of peaceful modes of adjusting international differences really believe. Even if "the principle of arbitration" were accepted to-morrow in perfectly good faith by all the great military powers, we should probably not, in consequence of it, see a soldier the less in any part of Europe, and for the simple reason that, even after all thought of aggression and all fear of attack had virtually disappeared, each country would seek in its armed force a sign and guarantee of its freedom and security, such as a private citizen derives from the sight of the police and the courts, even when he has not the least dread of robbers or assassins. In the present state of civilization, the preservation of national self-respect is hardly possible apart from a strong sense on the part of the nation of ability, not to do any particular thing, not to assail this

neighbor or annex that piece of territory, but to do whatever thing it may happen to please without let or hindrance; and this sense can only be got in Europe from the existence of an efficient armed force. Nothing else can give it until there has been a great change in the popular mind with regard to the use of force and the relation of force to morality—a change of which there is no immediate sign.

There are also, it must be remembered, three nations in Europe just now in that uneasy state of mind through which the individual passes just as he is entering on manhood. Neither Russia nor Germany nor Italy knows as yet exactly what it wants, nor, with the consciousness of great capabilities, has it made up its mind as to how its ambition is to be gratified. Moreover, each of them is surrounded by territory into which expansion is possible or over which influence is desirable. Of the opportunities of Russian growth we need not speak, and the future of the scattered races of Eastern Europe is certainly a problem with which Germany begins to think she will eventually have to deal, while it is quite safe to predict that the generation now coming on the stage will see on the part of Italy a revival of visions and dreams with regard to the basin of the Mediterranean which are none the less dazzling for having been extinct for fourteen hundred years. We shall probably have more serious talk of disarmament when each says she has attained her legitimate place and is satisfied.

## OCCUPANCY OF THE LAND IN ENGLAND.

London, June 5, 1875.

ENGLAND is still steeped in political slumber. The vessel of the state is lying motionless; her sails are flapping idly against the mast, stirred gently, now one side, now another, by the feeble airs of public opinion; the crew are idling about, and the man at the wheel seems to think it hardly worth his while even to glance at the compass. So it is at present. But there are some slight indications that the season of rest is after all but temporary. There are two small clouds on either side of the horizon. Both are creeping slowly, very slowly, over the sky, and you may watch them from day to day, and from month to month, and you cannot say which of the two is most rapidly gaining ground. This time last year it seemed as if the future condition of the Church was going to absorb men's minds, and interest the different elements that go to make up the Parliamentary constituencies. Attempts to tinker up the old institution were like to bring it down about the tinker's ears. The Government saw this in time, and, with what some call prudence, and others timidity, they dropped it before they did much harm beyond that of disturbing men's minds, and showing to the world how tottering and unstable the old fabric was. This year they have left the Church to itself, but they have opened up another question—that of the occupancy of land; and it remains to be seen whether in so doing they have not raised the sluices of even deeper political feeling and controversy than they did when they undertook the responsibility of a "Bill to put down Ritualism."

Speaking broadly, it may be stated that the greater part of the soil in England, estimated as exceeding two-thirds of the whole, has been held by wealthy, or in some cases not wealthy, landlords, who, as eldest sons, have in most cases received it under deeds of entail or by right of primogeniture from their fathers, just as the latter did in their day from their fathers. Few if any of these landlords farm their own land. They may hold in their own hands a home farm to supply beef and mutton for their tables, and hay and corn for their horses. The remainder of their landed possessions are occupied by farmers, farming from fifty to five hundred acres each, and, as a rule, holding their occupancies on no written lease or formal agreement, but merely at will, from year to year, and liable to be turned out on a six months' notice. A sort of feudal relation has thus been fostered between landlord and tenant. The landlord draws the same rent from the tenant that his father drew from the tenant's father, and expects him, in consideration of the lowness of the rent and the practical security of his tenure, to pay him such respect as an inferior used to pay to a superior in the good old days, to give him no trouble, to vote as he votes at all elections, and to render him such feudal or quasi-feudal services as the spirit of the times admits. All these requirements the farmer not unwillingly fulfils. He and his family live in comfort upon their farms, working on them from early morn to dewy eve, and trusting to their own exertions, unaided by any modern artificial agencies, for a sufficient return from the land to keep them surrounded by all the material comforts which they presume to want. Mutual confidence is thus established between landlord and tenant—the ambition of the one is satisfied with a human edition of the easy life which the animals on the farm share along with him, and the other is satisfied with the moderate rents and the modest feudal services which his farmer renders.

This pleasing relation subsisting between the owner and occupier of the soil has lasted uninterruptedly in England since, I may almost say, the days of the Tudors. There is something poetical about it, and in its way idyllic. But it is hardly abreast of the spirit of the age. Wealth has increased. Facilities of locomotion and communication have changed the face even of agricultural England. The conditions of farming are different from what they were. The small farmer, working his own patch of land with no assistance but that given him by the manual exertions of his family, is fast becoming a thing of the past. High farming is now a necessity. Expensive tile-draining and wire-fencing, artificial manures and rich artificial feeding, good farm-steadings and cottages, costly machinery of the newest kinds, laborers at high wages, and all the other expensive agencies that follow upon wealth and keen competition, have driven or are rapidly driving the small man out of the field. Farming is no longer a pleasant lounge for a lazy, unambitious man with not much more intelligence than his oxen and his sheep. It is becoming a business conducted by men of capital and of scientific education. And in like manner, the letting of farms is becoming a matter of commercial contract, instead of as heretofore a sort of easy, social understanding between the owner and occupier of the soil, in which the old feudal relation of superior and vassal colored the whole arrangement. In Scotland, where the people are shrewd and less influenced by the poetry of the situation than their English neighbors when it interferes with their interests, the feudal relation has long died out. Farms in Scotland are almost universally held on nineteen years' lease. The contract between landlord and tenant is a pure matter of calculation. At the expiration of the lease the farm is generally let to the highest bidder, the old occupier getting perhaps a first chance of his farm at a rent advanced from 30 to 100 per cent. The farmers are mostly men of capital, who lay out their money freely at the beginning of their lease, with the confident expectation of getting their return during the last five or six years before it expires. They are independent of their landlord, and grant him no service, feudal or other, except the natural courtesies which one gentleman grants to another. They have, of course, their grievances. No class of men in these islands is emancipated from a Briton's privilege of grumbling at his lot. But, on the whole, the Scotch farmer, as compared with his English brother, has very little cause for complaint. They will not admit this account of them, but you may take it as a fact.

A change in this direction is impending in England. The Government have been driven into doing something for the farming interest, which in a stolid and bucolic array supported them with the landlords last year at the general election. Accordingly, the Duke of Richmond, as the Lord President of the Council and heir-presumptive to the Premiership, introduced into the House of Lords, early in the session, a bill entitled the "Agricultural Holdings (England) Bill," the object of which, as stated by him, is to remedy a grievance complained of by the tenant-farmers of England, that they had no security for the capital which they invested in the soil. If the bill passes, tenant-farmers will, under certain conditions, have a legal right to compensation for all improvements made by them in their farms and unexhausted when they have to leave them. The improvements for which compensation may be demanded are classified as follows:

First Class.

| | |
|---|---|
| Drainage of land. | Making or improving of water-courses, ponds, wells, or reservoirs, or of works for supply of water for agricultural or domestic purposes. |
| Erection or enlargement of buildings. | |
| Laying down of permanent pasture. | |
| Making and planting of osier-beds. | |
| Making of water meadows or works of irrigation. | Making of fences. |
| | Planting of hops. |
| Making of gardens. | Planting of orchards. |
| Making or improving of roads or bridges. | Reclamation of waste land. |
| | Warping of land. |

Second Class.

| | |
|---|---|
| Boning of pasture land with undissolved bones. | Claying of land. |
| | Liming of land. |
| Chalking of land. | Marling of land. |
| Clay-burning. | |

Third Class.

| | |
|---|---|
| Application to land of purchased artificial or other manure. | Consumption on the holding by cattle, sheep, or pigs of cake or other feeding stuff not produced on the holding. |

Heretofore, all such improvements, by whomsoever executed, on the principle of law that *quicquid plantatur solo, solo cedit*, accrued to the land. So that if a tenant spent money on draining, building, manuring, or anything of the sort, he did so in the knowledge that he was spending his money not for his own nor his family's benefit, but for that of his landlord. In some cases tenants holding their farms only from year to year were not debarred by this knowledge from spending their money freely for their landlord's behoof. The Duke of Argyll, on the third reading of the bill before it left the House of Lords to be brought down to the Commons, told a story of a landlord friend of his which, unless colored by the ducal imagination, reads like a romance of agricultural life. The Duke's friend happened one day when he was hunting to find himself in a remote part of his county where he owned some farms. He had not seen them since he was a child; and when he got to them he did not know them. Where he recollected a barren moor, he found rich, well-ploughed corn-fields. Instead of a tumbledown farmhouse and ruined outhouses he saw a substantial mansion and a model farm-steading, and where of old there were straggling, untrimmed hedgerows and wide open ditches spreading over acres of good land, he saw neat wire fences cropping out of fine valuable land tilled to the very posts. The metamorphosis of his farms was so complete that it seemed as if magic only could explain it. But it really was due to a good tenant or succession of tenants in the same family, who had capital to expend upon their landlord's land, and confidence in their landlord's generous disposition, and a certainty that their family would not be dispossessed. But such confidence and such financial capacity are, if not impossible, at least exceptional. Nine English agricultural tenants out of ten have no spare capital, and they cannot borrow money from the banks (as they do in Scotland) on the security of their leases when they have no leases to offer. The landlords, on their side, holding for the most part under deeds of entail, and being what is called "limited landlords," cannot, except to a very small amount, raise money on their land for the purpose of improving it. Consequently, since neither landlord nor tenant is in a position to spend money, the land and the best interests of agriculture suffer. It has been calculated that under proper husbandry the productiveness of England might be doubled. But with the law of entail eating into the pockets of the landlords, and the custom of yearly tenancy, and the absence of any right of compensation for improvements crippling the energies of the tenants, it is impossible that it could be otherwise.

It is to meet some of these difficulties that this bill has been introduced. It passed through the House of Lords without much criticism and without a single division. Some of the Whig Lords spoke upon it, but only to show that they looked at all questions affecting land with a more stubbornly Conservative eye than the Conservative Lords. The fact, however, that it passed through one of the three Estates of the realm—that Estate, albeit, where every man is a landlord—without a division in any of the stages, is good *primâ-facie* evidence that, so far as the landed interest is concerned, as a bill likely to become an Act of Parliament it will not do much harm. In the Commons' House, where it is to be read a second time next week, it will receive different treatment. Already notice has been given by four members, representing different interests, of amendments which, if carried, would wreck the measure. Rumor has it that a strong Tory faction are to break away from the Government, and oppose it on old Tory grounds, and that attempts have been made to buy off this opposition by a lavish expenditure of peerages and baronetcies, in which the Tory heart delights. I hardly credit these rumors, because, as I have said, the House of Lords have passed it. That the Radicals will oppose it keenly I do not doubt, on the ground that it is a sham measure which professes to grapple with the difficulties of the question in the interest of the farmers, but which really will do no good whatever, except the good to be gained by directing public attention to a state of matters which only the sanction of antiquity relieves from being scandalous. As a question of practical politics, it is impossible that the bill can pass in its present shape. The landlords say that it goes too far in the direction of tenant right, and cuts deep into their feudal privileges. The large farmers and the political agitators say it does not go far enough. So long as it is permissive it will not operate for their interests; it can be made effectual only by making it impossible for landlords to contract themselves out of it. If a landlord insists on the principle of freedom of contract—a principle which the agitators consider to be an obsolete tradition—then a tenant is precluded from making a fair bargain with him. The tenant is so heavily handicapped that he has no chance in the race. And while these two sets of influential people—the landlords and the large farmers—are thus growling over the principles of legislation, the small farmers see to their horror that they are left out in the cold. They could pull along in the pleasant old quasi-feudal relation before their wealthy brethren came in with their principles of law and their compensation for unexhausted improvements. They make no improvements, and sink no money in their farms, but exhaust them from year to year to the best of their ability. But they pay low rents, and the landlords never think of a revaluation of their farms or a rise of rent. These halcyon days will be no longer. Farm-letting will henceforth become a hard matter of business, and every farm will be revalued as the current lease expires. My sympathies are with the small farmers, but my reason is very much against them. I should be sorry to see them harassed as they will be by revaluations. But I should be glad to see the land more profitably farmed and more productive.

# Notes.

HENRY HOLT & CO. have issued, in a fresh translation by Simon Adler Stern, Auerbach's 'On the Heights.' They do well to replace the version which they put out in 1867, and which, though by the practised hand of the late Miss F. E. Bunnêtt, was far from satisfactory.——Stereotyped plates of nearly forty years ago, in which was embalmed the debate on Catholicism held in Cincinnati in 1837 between Alexander Campbell (founder of the "Christian" denomination) and Bishop Purcell, have been brought to press again, and now furnish the first part of a thick volume called 'The Battle of the Giants' (Cincinnati: C. F. Vent). With this matter is bound up Mr. Gladstone's 'Vatican Decrees' and the various replies to it, with an abstract of his rejoinder; and purchasers will probably be found who, for the sake of the modern controversy, will pay for the older one also.——F. B. Patterson publishes in handsome pamphlet form Mr. James W. Gerard's paper on 'The Old Stadt Huys of New Amsterdam,' read before the New York Historical Society, June 15. Numerous legal actions, great and small, illustrating the manners of the original settlers of this island, furnish the writer his chief material. His narrative is much injured in the printing by making a paragraph of nearly every sentence.——Bulletin No. 3 of the American Geographical Society contains addresses by R. B. Roosevelt, on the geographical distribution of fish in the United States, and by A. L. Rawson, on Palestine. There is a long list of corresponding members and fellows elected, and of accessions to the library; but one is painfully reminded, by a comparison of this Bulletin with the Proceedings and Journal of the Berlin Geographical Society, of the difference between amateurishness and science. The latest *Zeitschrift*, by the way (No 56), has a map of Nachtigal's travels in southern Wadai and Dar-for. The same region is included in a more comprehensive but less finely executed map in the *Geographical Magazine* for June (Trübner & Co.)——We have received from Shanghai a lecture by Edward C. Taintor on 'The Iliad, and the Recent Discoveries at Troy.' Its chief interest lies in the information given about the antiquity in China of certain symbols stamped on the Trojan *fusaioli* found by Schliemann.——Prof. David F. Boyd, of the Louisiana State University, is about to take the position of Superintendent of the Military College of Egypt, and will be glad to receive reports, catalogues, and other publications pertaining to education in this country (especially military and scientific), with a view to forming a library of reference in the above college. His address will be Baton Rouge till Oct. 1; afterwards, Cairo.——Lee & Shepard have in press 'The Sovereigns of Industry,' by Edwin M. Chamberlin, the well-known labor-reform politician of Massachusetts.——The *Portfolio* for June (J. W. Bouton) is much embellished with a very fine study from a painting by Gérôme, heretofore unknown—a young Egyptian master of the hounds, surrounded by his dogs, and walking in a palm-orchard. The copy is executed in the photogravure of Goupil & Co., and is remarkably glittering and definite. The etchings are from Sir Joshua's heads of angels in the National Gallery—a subject imperfectly adapted for aquafortis treatment—and a bold theme of Constable's, etched with firm hand by Mr. Chattock. One of the articles gives an imperfect taste of Dürer's folio of drawings in the British Museum's print-room, and the notes on technique are resumed.

—The centennial literature of the week embraces 'One Hundred Years Ago—How the War Began,' a series of readable sketches by Rev. Edward E. Hale, reprinted from *Old and New* (Boston: Lockwood, Brooks & Co.), and Mr. Dana's privately printed Lexington Oration. From the latter one passage in particular is worth citing for its forcible presentation of a fact not unfamiliar but too often overlooked. The Massachusetts men who were capable of Lexington, and Concord, and Bunker Hill, were not, says Mr. Dana, "simple, peaceful yeomen and mechanics, unused to war and its works":

"During the great French war, every fifth man in Massachusetts had

been in the service; and a larger proportion of our able-bodied men had been mustered into service during the seven years of that war than Napoleon had led into the field from the French people at the height of his power; in fact, the people of Massachusetts had been, up to that time, one of the most martial people on earth. The historian Minot tells us that, in 1757, one-third of the effective men of this colony were in the field, in some form or other. In the expedition to the West Indies in 1740, Massachusetts sent five hundred men, of whom only fifty returned alive; and, of that force sent out, at least six were men of Lexington. Of the four thousand and seventy men at Louisburg, Massachusetts sent three thousand two hundred and fifty. . . . Massachusetts in 1775 was full of men who had been under fire, who had held respectable commands in the field, and had learned something of strategy and of military engineering."

—The Public Library of Groton, Mass., has just published a catalogue. It is of economic construction, and will no doubt be very useful. We mention it now to enquire the reason of one device not infrequent in catalogues of its class, which has always puzzled us. Books are entered under some word of their titles, because in country towns more people, it is found, remember books by their titles than by their authors; in fact, the popular intellect seems to consider the author as a very unimportant adjunct of a book, necessary perhaps to its existence, but of no further account. No entry is made, therefore, under his name. But if the library happens to have two books by one writer, they are put under his name. Is it supposed that the man who has the abnormal ability to compose more than one book must be able to impress himself more deeply upon unobservant minds and unretentive memories? It would not be difficult to enumerate several writers who are not likely to furnish more than a single work each to a collection of two or three thousand volumes, and yet are not altogether unknown to fame even in the rural districts. Boswell, Gibbon, Lamb, Macaulay, Milton, must occasionally be asked for by their own names, and not alone by the title of the works in which they are thought to have merged their individuality. And we fancy that librarians could point out several among the digraphic authors who are known neither by name nor title. On the whole, then, the rule seems unreasonable, and another entry is not useless even for the illiterate. The lady who asked for 'Spencer's Physcology,' and the man who wanted 'Mills' Mography,' would not have been much assisted in finding those books by either subject or title entry.

—A correspondent writes us from New Orleans as follows: "In looking over Webster's Unabridged Dictionary (1872), I have been surprised at the absence of the common names of those fishes which are most abundant on the Gulf coast, and most prominent and attractive in the fish-markets of this latitude. I find no mention of the pompano, the redsnapper, the croaker, or the redfish. On the other hand, such words as porgy, cunner, tomcod, sucker, red-eye, and bullhead, are given and defined. The omitted names are those of the best fish we have, and, in the opinion of some, the best in American waters."

—Another correspondent, prompted by our recent review of Professor Whitney's essays, sends us a list of idioms collected during a two years' residence in Central Pennsylvania. The only ones which are new to us are: (1) A pleonastic use of *do it* before verbs, as in "John won't do it give me that"; (2) a peculiar use of *behave*, as in "John won't do it behave hitting me." The next two are "Dutch" products: (*a*) *dare*, in the sense of *have permission* (*dürfen*), as in "Ma, dare I have another cake?" "You daren't move your knight in that way"; (*b*) *leave* for *let* (*lassen*), as when a child shut out of the room cries, "Leave me in!" or in "Don't do it leave him have it"; "The school left out at twelve o'clock"; and this, North of Ireland: (*c*) a singular use of *take* with *in*, and of *want* with *in* or *out*, as in "The school takes in at nine o'clock," "The dog wants in (or out)." You say to some one at the door, "Do you want in?"

—The illustrated and seasonable article in *Lippincott's* for July is "'May' in June," by "May" being meant Cape May. The distinctive features of this watering-place are sketched lightly with a pleasant fancy, and in a way both to oblige summer-tourists in quest of novelty and not to offend individual hotel-keepers. Possibly, *Lippincott's* audience, less than that of any other of the magazines, stood in need of information about this popular Middle State and Southern resort. Miss Agnes Lazarus translates, and translates well, so far as we can judge, a little tale by Turgenef, called 'Three Meetings.' Nothing could be more redolent of this author's style and manner of working. The skilful description of the sky and the landscape—the harmonious adjustment of them, we may say, to the dramatic situation; the lonely Russian manor-house; the fair countrywoman tormented with a misdirected affection; the melancholy, one suspects tragic, ending—it is all found in these fifteen pages as it is at greater length in so many of our author's works; but the disappointment over the dénouement is enhanced by the brevity of the tale, and for this reason one who has never read Turgenef should not be in haste to judge him by the 'Three Meetings.' A pathetic story is made the basis of an interesting paper by Leonard Woolsey Bacon, who half communicates a sad experience of his own when telling of "Searching for a Grave in a Foreign Land." This land is Switzerland, and the reason why one must search for a grave is that private cemeteries are not encouraged by Government, and that in the public cemeteries graves can be guaranteed at most for ninety-nine years, and in practice are renewed and memorial stones obliterated every fifteen years or less. Mr. Bacon proposes this grievance as a fit subject for international conference; but, if it hardly seems to be that, it at least deserves to be mitigated through the establishment by foreign liberality either of cemeteries set apart for foreign dead, and placed reasonably under foreign control, or at least of vaults or mortuary chapels in which the dead can rest until removal out of the country can be effected.

—We meant last week to have quoted from the *Galaxy* a very pleasing sonnet called "A Remembered Critic," to the memory of "J. R. D."—our late associate, Mr. John Richard Dennett. The verses are by Miss Alice M. Wellington, who, we believe, has written for the *Galaxy* before, and they are certainly remarkable for pure feeling and beauty of expression:

> "Kind words, that greater kindness still implied
> From one unused to praise, for one unknown
> To him and to the world where he had grown
> Less wont to cheer the artist than to chide;
> And always in my heart I thought with pride
> Some day to know him, and for him alone
> Bring the fair finished work, that he might own—
> 'O friend, behold my full faith justified!'
> Now he is dead! a man severe, they said
> Who knew the critic; but around the spot
> We call his grave, by some sweet memory led
> Of kindred sweetness, violets have not
> Refused to bloom; and one he had forgot
> Wept suddenly to hear that he was dead!"

—Government publications, since our last notice of them, relate chiefly to our still unknown Western territory. From the Engineers' Department, U.S.A., we have a cloth-bound Report on the Reconnoissance of Northwestern Wyoming, in the summer of 1873, by Captain William A. Jones. This was an important expedition, having for its object the survey of a military wagon-road from a point on the Union Pacific Railroad to Fort Ellis, Montana, by way of the Yellowstone National Park. The desired route was found (starting from Point of Rocks, 250 miles east of Corinne) to lie up the Wind River Valley, at the head of which is a pass (the Togwotee Pass) leading into the Yellowstone Valley. Though 9,621 feet high, it is quite practicable for a railway, and seems to offer the shortest and cheapest access to Montana. The construction of such a railway, says Captain Jones, "would, in all probability, be followed by the virtual disappearance of steamboat traffic from the Missouri River." Forty-nine trail-maps mark the course of the expedition, and there is a large colored geological map of the section traversed. The Report contains an interesting account of the peaceful Shoshones, with a copious vocabulary and specimens of their music.

"I frequently noticed the children crying and shedding copious tears, with expressions similar to those of white children in like cases. Laughter was very common, both among young and old, its only peculiarity being the very numerous and trifling exciting causes, and its grunting or guttural and explosive nature. The voices of the men and women are more nearly alike in pitch than is often found among civilized races. I never saw anything approaching a kiss, though our Indians were quite affectionate as compared with other tribes."

Another publication of the Engineers' Department is a 'Systematic Catalogue of the Vertebrata of the Eocene of New Mexico collected in 1874,' by Professor E. D. Cope, attached to the Wheeler Survey.

—Dr. Hayden's Survey issues three bulletins (second series). No. 3 is a report on the San Juan Country of Colorado, consisting of papers on the means of communication between Denver and the San Juan mines, by A. D. Wilson, and on the topography of San Juan, by Franklin Rhoda. The latter is illustrated by field views of Mount Sneffels and of the quartzite peaks seen across the cañon of the Animas. Mr. Rhoda's account of his climbing is very entertaining reading. One curious experience was the common meeting of grizzly bears on the highest peaks. Mount Sneffels was no exception:

"The claw-marks on the rocks on either summit of the pass showed that the grizzly had been before us. We gave up all hope of ever beating the bear climbing mountains. Several times before, when, after terribly difficult and dangerous climbs, we had secretly chuckled over our having outwitted Bruin at last, some of the tribe had suddenly jumped up not far from us and taken to their heels over the loose rocks. Mountain sheep we had beaten in fair competition, but the bear was 'one too many for us.'"

Still more singular and alarming were the electric conditions by which the party was occasionally surrounded on the approach of a storm:

"We had scarcely got started to work when we both began to feel a peculiar tickling sensation along the roots of our hair, just at the edge of our hats, caused by the electricity in the air. . . . When we raised our hats our hair stood on end, the sharp points of the hundreds of stones about us each emitted a continuous sound, while the instrument outsang everything else, and even at this high elevation could be heard distinctly at the distance of fifty yards. . . . Just before leaving the top I slung the strap of the tripod over my shoulder, and experienced a sharp pain at the two points where the tripod touched me. . . . We could detect the electricity in the air long before the clouds reached us by holding our hands high in the air, when a faint clicking was audible."

A note by Dr. Hayden completes this Bulletin: on some peculiar forms of erosion in Eastern Colorado. Two heliotype views by Osgood exhibit these forms very successfully. Another note, by the same authority, on the surface features of the Colorado or Front Range of the Rocky Mountains, is printed in Bulletin No. 4, and is illustrated by two striking panoramic profiles of the range from near Denver and of the Pike's Peak group. This number also contains Outlines of a Natural Arrangement of the Falconidæ, by Robert Ridgway, who, together with Dr. Coues, Dr. Gill, and Ernest Ingersoll, contributes to the natural-history reports in Bulletin No. 2. Dr. Gill treats of the relations of insectivorous mammals.

—In his recent Rede Lecture, of which we spoke lately, Sir Henry Maine refers to what he calls "the famous 'greatest happiness' principle of Bentham" as one of the "maxims of public policy and private conduct" likely to be revised and corrected by what he terms a new method of enquiry. Before discussing this point, it may be well to note that Bentham himself says: "Priestley was the first (unless it was Beccaria) who taught my lips to pronounce this sacred truth: that the greatest happiness of the greatest number is the foundation of morals and legislation" ('Works,' vol. x., p. 142). The credit of being the first to formulate this doctrine seems to belong to Beccaria. In the introduction to his 'Treatise on Crimes and Punishments' (*Dei Delitti e delle Pene*), first published in 1764, he says: "If we turn to history we shall see that laws, which are or ought to be the covenants of free men, have been for the most part only the instrument of the passions of some few individuals, or have arisen from a fortuitous and transient necessity, and that they have by no means been dictated by a cool investigator of human nature who had concentrated in a single point the actions of a multitude of men, and considered them from this point of view, namely, the greatest happiness divided among the greatest number (*la massima felicità divisa nel maggior numero*)." This "greatest happiness" principle, says Sir Henry Maine, "has great imperfections, unless some supplementary qualifying principles be discovered, and for these qualifications I look to some new application of comparative methods to customs, ideas, and motives." No doubt the wording of this motto of a great and influential school of practical legislation and morality needs to be explicated and explained in a manner quite different from that in which the critics of the school have done it. For these have drawn for the most part their understanding of the principle from the mere wording of it, without consulting the writings of which this motto is more properly to be regarded as the title or summary name. Yet it is far from clear, when we consult these writings, how the principle, as unfolded by them, could be supplemented by any qualifying principle of the sort which Sir Henry Maine suggests. It is true indeed that in what is the real difficulty of the principle in application—namely, in making a true determination of the objective happiness or true well-being of any people for whom a legislator has to make and improve laws—there is involved the consideration of many historical facts, historical products, in the form of existing "customs, ideas, and motives." That Sir Henry Maine should have supposed the consideration of these to be anything *supplementary* to the principle, and not rather already and essentially demanded by it, is surprising; for he cannot be supposed to have derived his whole knowledge of the principle, like most sentimental critics of it, from the words of its name. He must have known that in Bentham's writings, and in those of his immediate followers, a most detailed and laborious discussion of existing laws and usages is made an essential part of criticism on them, and of devices for reforming them. A more thorough knowledge of human nature, and of the force of customs, ideas, and motives, than Bentham possessed, are no doubt requisites for the wisest legislation; yet this can hardly be of the nature of supplementary principles.

—It should not be supposed that the greatest-happiness principle is anything more than the highest *practical* guide or test, wherever it is applicable, or that it has anything to do with the explanation of the historical development of law. It is not a theoretical principle. No one really acquainted with its meaning and use can suppose it intended for an explanation of the historical phases of laws and morals; for in fact it has had altogether too little to do with the growth of laws. It is, as Beccaria says, the principle which legislators *ought* to have observed, and is in great measure opposed to what they have really done. Nor again is this principle regarded by its advocates as an exclusive motive principle or sanction, except with the legislator as such, or with the influential citizen who has the power to mould opinions and customs or the secondary morals of society, and to bring to bear in *true directions* the various more immediate sanctions of laws and morals. To such as these, the guides and benefactors of society, the principle should be an all-inclusive motive principle, or the highest sanction, and cannot in this relation be the selfish principle it is commonly charged with being. Its real place in ethical and legal writings is as the practical principle of all true legislation, including under this the reformation of current moralities through the sanctions of opinion. The advocates of the principle also hold, however, that it is the true foundation of primary morals, as well as of the laws which legislation and opinion can and ought to make; but in this relation the principle can only be a theoretical one, or a summary statement of the rules themselves of human morality, since the primary morals, whether wholly instinctive or a mixed inheritance half-instinctive and half-traditional in a race, like language, are obviously not the devices of legislators and moralists, though such leaders have always had to do with applying various requisite sanctions to the fundamental laws of conscience. Yet the principle of "the greatest happiness for the greater number" is in this form of its enunciation essentially a practical principle or rule of duty for the legal and moral reformers and guides of mankind. As the fundamental theoretical principle of all human morality, or as the principle which has guided nature in the production of moral instincts and universal traditions of law, its statement should be modified; for in this relation it is the principle whereby *the greatest numbers of the most prosperous individuals have been produced* in races having the social nature of man. In this, its Darwinian form, it is, however, just as obnoxious as in the Benthamite or Beccarian form to believers in an *absolute* morality, who, on their principles, are bound to regard the conduct of the worker-bees of a hive as morally reprehensible, even from a reflective philosophical bee's point of view, when they kill their brothers, the drones, at the end of the season; although this apiarian custom conduces to produce the greater number of prosperous communities of the hive.

## RECENT NOVELS.*

THERE are many books (and perhaps it is fortunate for novel-readers that it is so) which conceal in their mass of verbiage a curious spell, that will hold a reader till the end, if he once yield his independence long enough to peruse the opening pages. But afterwards he may pick up the precise volume which so fascinated him and turn over its sibylline leaves with a dull eye, in great wonder at his own recent mood and in despair at the vapidness of his author. This reaction, however, often supervenes upon the study of even the best masters of fiction, and especially afflicts those who read much, and who ought accordingly to be rewarded by a greater proportion of enjoyment. We have sometimes speculated upon the particular qualities needful in a story-writer for effecting this primary fascination, and upon the weight which should be assigned to it in making up the account of his merits and demerits. Whatever may be his faults (and they are grave ones, at least so far as regards view-point), M. Victor Cherbuliez possesses this power of attraction. Yet, when one has gone entirely through a story like his 'Romance of an Honest Woman,' the question arises, what is there to be proud of or glad of in either the fact of the writing or that of the reading? We will admit at once that it is an exceedingly clever tale, not unworthy the author of 'Prosper Randoce' and 'Meta Holdenis'; it has remote roots in the author's imagination, as one may see by the distance from the main facts at which he begins, and by the accurate pertinency and the suggestiveness of these preliminary details. Moreover, he has taken a plot which is, on the whole, very trite, and by his mode of treatment and his judicious decorations has given it almost the air of novelty. The character of the heroine, "Isabella the Serious," as she has been nicknamed by her confessor, is an exceptionally sweet one, certainly—one that French novelists do not too much affect; but her somewhat masterful lover and husband, Max de Lestang, with his "face of bronze," is not only not new, but also annoying, and their misunderstandings are wofully hackneyed. It is true, one cannot but sympathize with their lively intellectual and emotional exercises; they really do the thing so well. But then they have a luxurious castle at their disposal in the South of France, whither they have retired at the height of the Paris season, and they take

* 'The Romance of an Honest Woman. By V. Cherbuliez. (Translation).' Boston: Wm. F. Gill & Co. 1875.

up the business of mutual irritation and mutual concealment of their real feelings with all the zest of people who from earliest youth have been accustomed to the epigrammatic French novel, and are conscious of the interesting figure they make as actors. Doubtless "they manage these things better in France" than here: injured women have not the taste for law-courts and for writing women's-rights novels there which they so frequently develop among us, and accordingly the novelist, while adhering to fact, loses nothing in delicate, artistic effect. But M. Cherbuliez adds to this quality of fact his many graces of literary art, his quick seizure of shades of character, his ability in epigram, his charm of description, and his flashes of dramatic imagination: "I shivered like a poor bird who has guessed without seeing that the hawk hovered in the clouds. Its invisible enemy is announced by an unknown horror in the very air, and it feels somewhere in space the weight of the hawk's wing." These delicate discriminations of emotion abound. Isabel's jealousy having been aroused, and Max becoming estranged, absenting himself in Paris, she is embarrassed by the admiration of a half-crazed youth in a pointed hat, one Monsieur Dolfin, who prates about himself at great length and with considerable skill, and finally interests her a good deal. Max returns; there are ebullitions of fearful passion and a climax. She has remained entirely true to him, but tempts him to believe otherwise, and he, becoming desperate, attempts to kill her. He only wounds her, however, and is checked by remorse:

"Then suddenly he did a strange thing. He looked at the knife, saw on it a drop of blood; and, as if to quench a mysterious thirst, he raised it to his lips and drank it. Then, throwing the knife violently on the floor, he fled."

This very characteristic passage reminds one of the similar animally instinctive insight, as one may call it, in 'Joseph Noirel's Revenge.' Here we have the moment of supreme power in the book, and there is a horrible reality, a painful fascination, about it. One cannot avoid astonishment, but equally one can hardly respect the man who presents us with such sensations. The story turns out well, but we are left with an uncomfortable suspicion of refined charlatanism in the author, which arises from this and kindred points in the book; and, on the whole, we are disposed to think that the superficial charm of it cannot outweigh the excess of artifice and epigram over substance which impresses one at every turn, on a reperusal.

'In The Camargue' is useful as showing how an authoress, who is perfectly aware that she ought to be interesting, in view of her fresh material, can yet completely fail to be so, and partly through that very consciousness. Miss Bowles had evidently spent a winter in Languedoc getting up her facts, and here they all are—a great many too many of them. She can talk about *têradous*, a *mas*, or a *dondaïre*, and explain them all in foot-notes; she has acquainted herself with the Greek derivation of the name Camargue, but, unfortunately, her winter's board did not teach her how to draw men and women. The plot is not especially new. Young Morland, looking about in the picturesque neighborhood of Aigues Mortes for good "bits" to paint, is attracted by Noël Privas, a farmer's daughter. He is careless, and commits himself by the most downright promises, while his friend Nasmyth feebly tries to act the part of a conscience to him. Morland then returns to England, and marries one Car Chetwynd, at which Noël would naturally be grieved, though in this instance the peculiarly malicious name of her rival must have greatly aggravated the matter. She goes to a neighboring convent and devotes herself to good works, and Nasmyth, who has also cheerfully entered into the wedded state at the same time with Morland, comes down with his wife to see her, when a little of the quietly pathetic is introduced with a skill well calculated to send the average reader hurrying to the circulating library for another new novel a little worse, if possible, than the example in hand.

Mrs. Alexander is a very different sort of person. She has already gained considerable favor by her two previous novels, and 'Ralph Wilton' will do her no discredit, we think, with those who have come to look upon her as the best minor novelist among the women writers of the day in England. She is as much superior to the Mrs. Woods, the Edwardses, and the Braddons as the pretty little muslin volumes through which the "Leisure Hour Series" has introduced her to us are preferable to the lanky and long-paged paper-covered tomes in which those other worthies have been in the habit of appearing. Not that Mrs. Alexander is anything very extraordinary as an artist; for she quietly assumes at the outset a conventional and somewhat too coolly skilful tone to rise especially high in æsthetic harmonies of language or suggestion; but within her range she has a firm, sane, unsentimental touch, and imbues her pages with a warm and contagious earnestness throughout. She tells her story in a straightforward manner, and presents it in small compass. The shaping, indeed, strongly suggests French influence, and it is noticeable, by the way, how much the nice dovetailing of scenes and incidents is just now preferred by all noticeable novelists to the old considerations of probability. The accidental novel would seem to have had its day. Mrs. Alexander suffers, too, from the prevalent want of genuine humor among writers of fiction—that humor of which George Eliot alone preserves the tradition. But it would be impossible to gainsay the skill and feeling with which she has presented the delicate, fresh, vivacious character of her heroine; and there is something very satisfactory in what must be called the English stolidity of Wilton. The dénouement of the story is one which would be clap-trap under ordinary treatment, and goes far to nullify the effect which the book was apparently written to attain, viz., the showing how well a man may lay aside the superficial considerations of class, and trust himself to the instincts of his unbiassed manhood. But to us perhaps the most interesting result is the side-illustration we get of the practical uses of gentlemanly reserve in critical emergencies. Wilton puts up with an amount of annoyance from his friend Moncrieff which is excessively irritating to the reader; but his complete self-possession secures him in the end a commanding position, with Moncrieff in a very uncomfortable attitude of apology. This very reserve, however, was a compensating accompaniment of the conventional surroundings of Wilton's previous life. In equipping him with this quality, Mrs. Alexander is as true to nature as she is in all other points of the narrative.

Christian Reid has once more demonstrated her ability to prepare a light—a very light and thin—summer-beverage sort of fiction in a larger or smaller quantity, as may be desired. This time it is called 'Hearts and Hands,' and is confined to sixteen chapters; but there is room within its covers for the inevitable White Sulphur Springs and the usual inconstant young woman. Sybil Courtenay begins by shooting off at a tangent from the side of Jack Palmer, and after ricochetting about a little finds herself in the arms of young Langdon, a painter, with whom she goes to Europe and lives happily. In no way of which we are aware does the telling of a large part of this instructive tale in the present tense enhance its effect. But the present is preferable to the future, at least when we reflect what that future may bring forth of a similar kind.

Mr. Black is perhaps the most uniformly successful of the school of novelists—if we may call that a school which has neither a head nor any definite code—which has arisen since the disappearance of Thackeray and Dickens. It is indeed a remarkable proof of the force and originality of these two writers that they left no followers. It is not long since they were, each in his different and opposite way, the representative of what seemed to be two different and opposite tendencies in English literature. On one side was the jovially sentimental view of life, one which aimed, partly by sheer good-humor, animal spirits, and good-will, to solve the complicated problems of society and life; the other, the pathetic and cynical view of life, which aimed at a solution of the same problems, in the case of most of them, by the shibboleth of *vanitas vanitatum*. We look around in vain for their representatives to-day. They have founded no school, and left no followers. Possibly the explanation of this may be in the fact that, after all, their greatness lay in directions wholly independent of their philosophy, and that while the latter was in both cases really weak, their strength was of a sort so individual as not to permit reproduction. Dickens's individuality was primarily that of a caricaturist; Thackeray's, that of a drawer of character. Their philosophy of life was really of very little moment, and, though they thought it themselves of the first importance, and for the time being the public may have been induced to agree with them, the delusion could not, in the nature of things, be kept up very long; and by the time that Thackeray and Dickens had disappeared from the stage, the cynicism of the one and the "gush" of the other had satiated us. There are plenty of people, no doubt, who would have been glad to rechristen literary offspring of their own as new Fagins, Betsy Prigs, Sam Wellers, or to have been able to produce such characters as Becky Sharp, Colonel Newcome, or Ethel or Major Pendennis. But this was exactly what they could not do, and so, as we say, there is hardly more than a trace to-day in English fiction of these giants of yesterday. We should be puzzled to find in William Black, or George Eliot, or Thomas Hardy, or any other of the rising or risen—or, for that matter, setting—names any traces of their influence. Of course we would

'In The Camargue. By Emily Bowles.' Boston: Loring.
'Ralph Wilton's Weird. By Mrs. Alexander.' New York: Henry Holt & Co. 1875.

'Hearts and Hands. A story in sixteen chapters. By Christian Reid.' New York: D. Appleton & Co. 1875.
'Three Feathers. A Novel. By William Black. With illustrations.' New York: Harpers. 1875.

not dream of denying the possession by Miss Thackeray of a very pretty gift; but we are talking of literary, not natural, descent.

It would probably be easier to define Mr. Black's position by negative distinctions of this sort than by a positive way. He is not like Dickens or Thackeray, or, for that matter, not like Miss Austin or Richardson. He is not a caricaturist. He is not theatrical. He is not a moralist. He is not an acute analyzer of human situations into their molecular elements. He is no blustering romancer. His plots are simple, his characters are well drawn, his situations natural and descriptions of scenery agreeable, his selections of music (which here and there in his stories take the place of that sort of accompaniment of initial verse once in vogue) are always good. His philosophy is *nil*. There is nothing superlative about him in any way. There is no danger of any one crowning him as the genius of the future, and we cannot but fancy Mr. Black extremely grateful that he has escaped that peril.

The 'Three Feathers' is a simple love-story, the scene of which, as the title obscurely indicates, is laid in Cornwall. The principal characters are Miss Wenna Rosewarne, the heroine, and her sister, Miss Mabyn, the latter a gay, vivacious, slightly pert young girl, extremely fond of her sister, however, whom she is determined to prevent from marrying a certain Mr. Roscorla. Wenna herself is a young lady of a shy, modest, and self-distrustful disposition, who devotes herself to the care of the poor of Eglosilyan, the village in which most of the scene of the story is laid. Her girlish piety and tenderness seem a little overdone, but nevertheless she is a prettily-drawn character. She and her sister are the daughters of a couple who have seen better days, and now have retired to Eglosilyan, where they have taken charge of the inn, which is, however, as different from most other inns as the Rosewarne family is from that of most landlords. The great people in the village are the Trelyons, the latest scion of the race being Master Harry Trelyon, a headstrong and ill-mannered boy, who makes it disagreeable for most people with whom he comes into contact. To reside in this little village comes Mr. Roscorla, a gentleman not far from fifty, who, beginning life with an income just enough for his wants, and spending it in a career of thoughtful selfishness, leading the life of a club-man, has suddenly found himself well advanced in middle life with an accidentally diminished income, and obliged to economize. He determines to retire to Eglosilyan, and there he takes a neat cottage to spend the remainder of his days in. He does not fall in love with Wenna, but after a time he persuades himself that he has done so, and offers himself in marriage by letter. Mr. Roscorla is an admirably-drawn character. His selfishness, his knowledge of the world, his good sense, his cynicism, his delusions about his feelings towards Wenna, the ludicrous embarrassments of the situation between an accepted suitor of fifty and a girl in her teens, neither of whom is really in love with the other—is all depicted with the humor and vivacity that are the peculiar gifts of the author of the 'Strange Adventures of a Phaeton' and 'A Princess of Thule.' Wenna having accepted Roscorla, it is needless to say that Harry Trelyon is much shocked on hearing the news. Why, he hardly knows himself except on very general philanthropic grounds; but by-and-by, as the story goes on, he discovers that the reason is no other than that he is in love with her himself, and still later it begins to be made pretty clear that Wenna, whose affianced husband has gone to Jamaica to look after his property there, has also fallen in love with him. The various turns the story takes in order to make it possible that the first engagement shall be broken off and a new one made, we must not detail; enough to say that they preserve every one's self-respect, including Mr. Roscorla's—though to the rest of us that selfish old man appears in his true character before the story is over.

Those who have read and liked the 'Strange Adventures of a Phaeton' or 'A Princess of Thule,' will not find themselves disappointed in this story. It is not a wildly exciting tale, nor is there anything in it to compare with the opening chapters of the 'Princess,' in which we first make the acquaintance of Sheila, the King of Borva, and the Hebrides. But then Mr. Black must himself admit at least that he outraged all our best feelings when he brought his Princess to London and surrounded her innocence and beauty with the pettiness of town-life. The 'Three Feathers' is, on the whole, more evenly written. As a mere story—a natural succession of events relating to people in whom we are interested, and which are themselves just exciting enough to make us feel that we are in the midst of action—anything Mr. Black writes is sure to be pleasing and agreeable.

Let no man hereafter despair of anything; even Ouida improves! She began several years ago with writing unmitigated nonsense, and she now writes nonsense very sensibly mitigated. The mitigation is due, doubtless, to various causes—to experience, maturity, the *Saturday Review*, and, in a measure lately, we infer, a residence in Italy. Ouida is essentially a charlatan, and will never be anything else; but if 'Signa' were her first book instead of her last, and if the damning list of its predecessors were not staring at you from the fly-leaf, you would almost suffer yourself to fancy that it was a work of promise. A certain garish and lascivious imagination was formerly this lady's stock-in-trade, but little by little it has consented to go into training, and it has been perceptibly refined and purified. Ouida's notion of training, apparently, has been to read a good deal of Victor Hugo and a little of Swinburne's prose, and to try and produce something which should suggest a compound of these masters. It speaks volumes, doubtless, for the author's original manner that the effect of this process has been chastening, but it is obvious that Ouida has been keeping better company intellectually than of yore, and has acquired in consequence a superior tone. 'Signa' is at once the name of a place and the name of a person; of an old Tuscan city and of a foundling child who grows up there and springs into fame as a musical composer, in his teens, with the delightful facility of romance. There are various other people, but we are quite unable to give a coherent account of them. There is a dusky, moody, oppressively picturesque uncle of Signa, who brings him up and becomes exceedingly fond of him, and there is, of course, a "light woman out of France," who indeed turns out to be a very heavy woman out of Italy, and whom the uncle stabs in her bed for corrupting the innocent mind of the hero. The work is a perfect curiosity in the way of diffuseness, and there is hardly a sentence in all its high-flown length that means anything very particular; but Ouida has quite brought to perfection the art of seeming to mean something, and to make, at a small outlay, a great show of pictorial and psychological power. Her faculty of spinning fine phrases, descriptive and other, which will pass muster as brilliantly picturesque writing, is quite unparalleled; for pure charlatanism was surely never wound up to so high a pitch. To drop into honesty now and then is generally found a shorter cut. When examined, Ouida's brave words are generally found to escape very narrowly being arrant rubbish; but it is in virtue of this saving margin of real imagination that we said just now that if the author's bad habits were not so confirmed, her cleverness might be held to contain the seeds of promise. Ouida has imagination, unmistakably, and it is a real pity that she has not a little good sense. In attempting to depict peasant life in Tuscany she has taken an audacious plunge; but we cannot complain of a want of local color; it is poured out in bushels, it is laid on with a trowel. It is, of course, all hopelessly wild and crazy, and to point out specific aberrations would be idle. It is, however, in her æsthetic and scholastic allusions that Ouida is most amazing; it is not too much to say that every proper name in the work that does not belong to the *dramatis personæ* is introduced with some ludicrous obliquity—to say nothing of their being spelled and printed in a manner that makes half of them hopeless riddles. Yet in spite of her appalling verbosity, her affectations and inanities and pruriencies, Ouida has a certain power of dramatic conception and effective portraiture which it would be ungenerous not to acknowledge. There is a touch of poetry and a certain force of coloring. The poetry is a tissue of Bohemian shreds and patches, and the colors have been mixed in an old rouge-pot; but if you don't look too closely they produce a sort of gas-light illusion. Ouida's people are better than her things, and her dialogues better than her descriptions. We confess that, even amended and improved as we find her here, she is not to our minds possible reading. But then we know that we are fastidious, and we are tempted to wish we were not, so that we might innocently swallow her down and think her as magnificent as she pretends to be.

'Signa: A Story. By Ouida, author of 'Strathmore,' etc.' Philadelphia: J. P. Lippincott & Co. 1875.

## LITTRÉ'S FRENCH DICTIONARY.*

WHATEVER hesitancy there may be in fixing upon the best of the larger English, German, Spanish, or Italian vocabularies, there can be none when a French dictionary is to be selected. Littré's is by so far the best in every respect, that works which before its appearance were considered as fair may now be altogether disregarded. It cost its author more than twenty-five years of labor. It covers about 4,800 closely-printed quarto pages of three columns each. That he must have had some assistance to complete a work of such magnitude is self-evident; for he prepared it and carried it through the press without seeming to interrupt his other pursuits. Yet we have it on good authority that not merely is the general plan and arrangement his own, but even the material execution is mainly his. The examples were selected by him, the passages quoted were marked by him,

* 'Dictionnaire de la Langue Française. Par E. Littré.' 4 vols. Paris: Hachette; New York: F. W. Christern.

and copied in his own family under his own eyes. A very large part of the manuscript was in his own hand—all the etymology, for instance, the grammatical remarks, and we may suppose the definitions, which are so characteristically his. Few large works on lexicography are more fully original; none more constantly bears the imprint of the author's personality in every part. Yet with the true generosity and kindliness that characterize breadth of learning, Littré acknowledges in his preface his indebtedness to many "collaborateurs," some of whom are known as specialists in French letters. He has further drawn largely from sources not used heretofore as they should have been, among others from two immense manuscript collections of unpublished documents. The first, the 'Dictionnaire historique de l'ancien langage françois,' by Lacurne de Sainte-Palaye, fills many folio volumes in the Bibliothèque Nationale. Only a small portion of this was published towards the end of the last century, but the whole is now announced for publication in ten vols. under the direction of L. Favre, the author of a very uncritical glossary of the dialect of Poitou. The hundred manuscript volumes left by Pougens, now in the library of the Institute, have also been freely used, and are often quoted in the course of the work. Both of the above collections are the result of lives of toil. Death and unfavorable circumstances prevented their publication. Littré, more fortunate, has seen the close of his work, though it was begun at a period of life when man thinks rather of rest from labor than of new undertakings. He has accomplished in his old age what to one starting in life might well seem the work of a lifetime.

Sainte-Beuve, in his excellent notice on Littré, gives interesting glimpses into his private life. We are told that he works from half-past six in the evening until three o'clock in the morning, and this with unfailing regularity. This alone can account for his marvellous productiveness in so many directions, for Littré is distinguished as a writer on philosophical, philological, literary, and even political subjects. He published and translated the works of Hippocrates in ten volumes and translated Pliny. He has never lost sight of his early studies in the physical sciences, especially medicine. There is a charming bit of autobiography in regard to this in the preface of his 'Médecine et Médecins' (1872). His publications in regard to the positive philosophy of Comte have done more than those of any other writer to make that system accessible to the world at large. He is, then, representative of many branches of human learning. His works upon early French literature and philology and upon Romance philology in general, have, in addition to the merits of detail which specialists alone generally attain, a breadth and method of their own; for he has applied to the study of language the processes of investigation in the natural sciences and the method of the philosophy to which he has devoted himself.

No one could be better qualified than Littré for the task he imposed upon himself when he undertook to make his dictionary. A man of science alone would not have been competent for the literary part. One exclusively devoted to letters would have neglected the scientific portion of the vocabulary or treated it incompletely. Littré, standing in an intermediate position between the literary and the scientific world, having moreover by his philosophical training and bent of mind something more than the fineness of taste which letters give, could with complete success devote all his energies to what is generally a thankless task. The French Academy refused to admit him the very year the first number of his dictionary appeared (1863). It was remembered that he had many years before translated Strauss's 'Leben Jesu.' Since then that body, in spite of the vigorous denunciations of high and eminent church dignitaries, have done him tardy justice and honored themselves by receiving him.

To appreciate our indebtedness to Littré we must compare him with his predecessors. He himself opens his preface with a quotation from Furetière, who fared ill at the hands of the French Academy for having dared to prepare a dictionary which was terminated before the first edition of theirs in 1694. Furetière's work, successively enlarged and embodied in others, was the principal rival of the various modifications of the Dictionary of the Academy, which has now passed through six editions. A certain fetishism exists in regard to

"Ce beau dictionnaire,
Qui, toujours très-bien fait, sera toujours à faire,"

from which even Littré could not free himself entirely. A few, though very few, timorous writers and speakers hesitate to use words which the Academy has not registered. Although it is a notorious fact that even the last edition of 1835 is lamentably incomplete, it still holds its rank as a traditional idol that it will not do to neglect wholly. Littré, whether from conviction or from motives of policy, has respected this linguistic superstition and omits no word that the Academy had retained. He simply inserts a † before the others. That the Dictionary of the Academy is inadequate, that it leaves out many words in common use, that its choice is often arbitrary, any one may see by turning over the pages of Littré, and noticing the words marked †, many of which are found in the best writers. Its decisions, formerly considered final, are now frequently disregarded. It represents or rather represented forty years ago the extreme conservative party in language. As to the more modern lexicographers, we have Napoléon Landais, who made it a point to contradict the Academy whenever he could. Later came Bescherelle, whose work was fuller than any preceding one. In Poitevin's larger vocabulary some of Bescherelle's errors have disappeared, but it is not so complete. Larousse's 'Grand Dictionnaire du XIXe Siècle' is not yet finished; it aims at being an encyclopædia. Dochez's Dictionary (1859), from some unfavorable circumstances, did not come before the public as it should have done. It deserved to be better known, if only for the good intentions of the author, who died before its publication. This and the projected 'Dictionnaire Historique' of the Academy, of which only two *fascicules* have appeared, are the only works that can at all be compared with Littré's.

Some have been tempted to institute a comparison between Littré's work and the publication known as Grimm's 'Deutsches Wörterbuch.' This is unjust to both. The starting-point and aim of the two are essentially different. The German work, of which the publication was begun eleven years before Littré's, is planned on a vast scale. It is a national undertaking, and will present the result of the labors of many. What it will be when completed, only those who are now young can hope to know. That it may be found less practical for hasty reference than Littré's, or that Littré's may in many cases be less full, is to be expected. The 'Wörterbuch' is a learned work. Littré disclaims every idea of aiming at erudition. He says, in so many words, "L'érudition est ici non l'objet, mais l'instrument." He merely seeks to complete what he calls *l'idée de l'usage*. He wishes to show *l'usage complet* of the language from the earliest days to the present, and thereby to prevent those arbitrary decisions which have been too frequent in French, and we may add in English, grammars and dictionaries. Wishing to give "to present usage all the fulness and security that it admits of," Littré bases it upon a historical study of the forms and meanings through which words have passed. In order to do this, he has carefully classified the definitions. The Academy and others give first the usual meaning of to-day, and then, without any clear order, the various senses the word may have. Littré first gives the meaning which the word has etymologically, unless that meaning had disappeared before the seventeenth century, in which case it is found elsewhere. For he assumes that the language from about the time of Malherbe (died 1628) had become fixed in the shape it has virtually kept since. After this first meaning, or the one that deviates the least from the etymology, he gives the others in logical sequence. This strict classification of the definitions from the primitive ancient sense, through the sometimes almost imperceptible shades, passing on to the deviations and figurative uses, is one of the main features of Littré's work. Thus, the Academy gives *fondre* as meaning to melt, to cast, to dissolve, to unite, combine, blend, to soften, to disappear, to vanish, to squander, to fall, to rush, to pounce down, to attack. This bewildering list, generally followed in French-English dictionaries, has not even the merit of completeness. In Littré the word is explained under nineteen heads, and the logical sequence is further set forth in the paragraph upon the etymology.

As to the definitions, they are simple and straightforward. The French language seldom admits of that easy process of working backward and forward with synonymous words so convenient in English, owing to the double vocabulary of Saxon and Latin elements, as when we find FLOOD, an inundation; and INUNDATION, a flood. Still, Littre often has recourse to analogous methods, and though in such cases he sometimes adds very good remarks upon synonyms, he not unfrequently fails to do so, as may be seen by his treatment of the group *fier, hautain, altier, orgueilleux, superbe, avantageux*, etc. In general, for technical and scientific terms he willingly sacrifices precision to clearness. He does not make his work for specialists, but for the general reader. A striking example of this is his definition of the word *homme*. In the 'Dictionary of Medicine,' which Littré edited in 1865, we find the definition: HOMME, *animal mammifère de l'ordre des primates, famille des bimanes*, and so on for thirteen lines. This wholly physical definition, which at the time was the object of indignant accusations, is replaced in the 'Dictionary' by one which probably gave offence to nobody; *animal raisonnable qui occupe le premier rang*, etc.

In the grammatical observations there is an absence of pedantry that is particularly refreshing. The lexicographer does not try to lecture authors upon their use of language; he rather seeks to explain the usage he finds, setting aside many of the over-nice distinctions that have been made by grammarians, as between *commencer à* and *commencer de*, *aider* and *aider à*.

Many of these grammatical notes are to be found under prepositions ; and yet the articles upon words of this class, though generally very long and rich in illustrations, are disappointing. The examples are classed according to what seem to be rather accidental, outward circumstances than according to the fundamental meanings. The information found in Littré in regard to *à*, *de*, *en*, etc., needs to be supplemented by what may be found in Lafaye's 'Dictionnaire de Synonymes.' Probably many of the distinctions there given may have seemed fanciful to the logical mind of our author. Contrary to his custom, he has in this case omitted much without replacing it by anything of his own.

The examples grouped under each word to illustrate the meanings are mostly chosen from the classical authors, principally those of the XVIIth century. Occasionally there is a quotation from Châteaubriand or Mme. de Staël, but there are very few from contemporary literature. Yet George Sand, Sainte-Beuve, Mérimée, are authorities now for the use of words no less than the writers of the age of Louis XIV. Appreciating fully the motive that led Littré to choose as he has and to omit in general citations from living writers, we too often feel the want of examples indicating present usage with more precision. It would be ungenerous to dwell upon this in presence of the judicious and broad selection of illustrations to be found in the Dictionary. We can only feel grateful to the scholar who has collected them and classed them in a way so convenient for reference. Showing as they do the freedom with which words have been used by authors whose authority is recognized, we may hope that we have seen the last of such narrow verbal criticism as is found in Voltaire's commentary on Corneille, in Bret's notes to Molière, and in most of the commentaries on Racine. The futility of many of the remarks of such annotators, too often copied in the school editions of French classics, may be proved by a glance at Littré's examples.

The general excellence of 'Littré's Dictionary' will cause it to rank as the highest authority. It is therefore proper not to pass by its only weak point—the pronunciation. The author does not seem to possess the qualities necessary to treat this subject properly. To do this there is wanted not so much learning as tact and nicety of ear, not the power to decide what *ought* to be so much as the readiness to accept what *is*. A man of the world, with a nice ear and good taste, having a broad and constant experience of the best society, even were he a little futile and inclined to stop at the mere form, might be and probably would be a better guide for pronunciation than the profoundest scholar, who necessarily leads a life of relative retirement—unless indeed the latter has made the science of orthoepy his specialty. That Littré throws his own personality into his treatment of the etymologies and into his disposition of the definitions adds to the merit of his work, but that he seems to be guided mainly by his personal habits and tastes in all he says of the pronunciation is its only great blemish. We do not mean to say that many of his remarks are not very valuable. He in many instances carefully notes the old pronunciation when it is known. He not only directs how to pronounce the words, but often how not to pronounce them, or, after stating his own preference, he gives without exactly condemning it a current pronunciation of a word which had generally been rejected as incorrect, as he does under *linceul*. He notes many of the cases in which a final consonant should or should not be linked or carried over to the next vowel, though in this he has not followed a very regular system. But on the whole he is an unsafe, a dangerous guide. He does not represent or give fairly the usual pronunciation of Paris or of Northern and Central France. His figuration of the vowel sounds as to quantity and even as to quality is in many instances false. This, as far as we are aware, has been little noticed in France, simply because pronunciation, except as regards anomalous words, is something to which the French people at home give very little thought, or at least for which they are not likely to refer to a dictionary. What matters it to them that Littré gives *mauvais* as *mô-vê*, *croyant* as *cro-ian* (with the remark, "d'autres disent croi-ian"), *fils* as *fî*, adding that to say *fiss*' "est une très-mauvaise habitude," and numberless arbitrary indications of the same kind directly opposed to general usage ; they will never consult him for the pronunciation of such words. If the Parisian of average culture reads Littré's preface, p. lix., and finds the directions in regard to liquid *l*, it is probable that he will not understand them at all. There are millions of northern Frenchmen who have never heard the old, the true liquid *l*. This sound, which it is not easy to describe (it may be found explained in Bell's 'Visible Speech' and in Ellis's 'Essentials of Phonetics'), is heard in Spanish *ll*, Italian *gl*, or Portuguese *lh*. Though preserved in certain parts of France and in Switzerland, it has about disappeared in the north and especially in Paris. It is not even heard on the stage, as the writer of this article can testify from careful personal observation made lately. There, as elsewhere, *ail'eurs* and *bouteille* are distinctly uttered as if written *a-yeur*, *bou-tè-ye*, with what Littré calls *une prononciation vicieuse*, against which he warns upon every possible occasion. It cannot be denied that Littré has logic on his side. Historically, liquid *l* should be liquid *l* and not *y*. Logically, the Genevese are right in pronouncing as they do, and it would be folly for them to abandon a rich, true, and beautiful sound of *l* for the lazy vowelly articulation heard in Paris. But all Littré's influence and all the logic of ancient custom will not prevent the Parisians from pronouncing as they do. The dying away of the true liquid *l* sound, its gradual passage into a mere *y* sound, is *un fait accompli*. It would be about as easy to bring back into English the old sound of *gh* in such words as *through*, *thorough*, as to go up the stream and make the mass of Northern Frenchmen pronounce *fille*, *famille*, *gentille*, otherwise than they do.

Under the heading "Historique," there is a separate paragraph for every word used before the seventeenth century, in which examples are grouped under each century, beginning with the ninth, if the word occurs so far back, and coming down through the sixteenth. This, for the student of language, is one of the most attractive features of the work. Here we may trace the gradual passage of words from their ancient signification, the only one warranted by their etymology, to their present meaning, often far removed from that of their primitive ; interesting in this respect are the words *danger*, *élire*, *valet*. Here, also, we may study curious analogies and differences between the present usage of English words and their ancient meaning in French, as under *dais*. This historical part, as M. Paul Meyer has well shown in an excellent review of the work in the *Revue Critique*, leaves much to be desired. This was inevitable, as the larger works on lexicography can never present the results of the latest researches. They necessarily need long preparation, so that while their authors have been collecting and classifying their materials, new facts have come to light, new and better editions of old works have appeared. Thus, Littré has not used even in his last volumes the collection of poems in the Carolingian cycle published under the direction of Guessard. He unfortunately quotes the 'Chanson de Roland' from the inaccurate text of Michel. He uses the incorrect and systematically-modernized edition of Froissart by Buchon, and places his examples from this chronicler under the fifteenth century, although Froissart died in 1410, and is therefore certainly a writer of the fourteenth century, having received the language that he used before 1350. In several other cases the edition used seems to be very arbitrarily chosen. Montaigne is quoted from the edition of Naigeon of 1802, which differs in several passages from the text generally received. Molière is quoted from the small edition by Louandre, which, though presenting a pretty good text, is not the best. Similar remarks would apply to many of the great writers that are quoted. Indeed, the list of the principal books from which examples are chosen, given at the end of Volume IV., would not be a safe guide for one seeking bibliographical information. It was certainly not the author's intention to give such information ; but it is to be regretted that the excellence of his work should be slightly, though very slightly, impaired by his disregard of editions. What cannot be too highly praised is the honesty with which the quotations are made. The verse, the strophe, or act and scene, in many cases even the page, is given ; so that for many of the important French writers Littré's Dictionary is an index, a valuable concordance to all the remarkable passages.

The etymological part, though occupying but small space as compared with the rest, is that to which Littré has undoubtedly given the most of his personal care. We feel in his short and clear statements that it is a master who speaks. He generally gives his own opinions unhesitatingly, without discussing the other etymologies that have been proposed. In some cases, however, he departs from this method ; after stating the conjectures of others, he gives his own with a straightforward conciseness that always inspires respect if it does not convince. It is almost impossible to realize how absurdly weak the larger French dictionaries that preceded were in regard to etymologies. Littré could take nothing from them. He owes much to Diez's 'Etymological Dictionary of the Romance Languages'; and Scheler's work, of which a second edition appeared during the progress of Littré's, also gave him much assistance. But in this field Littré has been an original worker. His opinion, whether he has accepted formerly received derivations or proposed new ones, must hereafter always be taken into account. We can scarcely hope that the learned author will be able to give a second edition of his work, but if he should, we may be sure that many additions will be made, especially to the etymological part. There is a notable improvement in the way the etymologies are presented or discussed as the work advances; the dialects are used to more purpose, and there is a surer, a firmer treatment of the etymological elements that reach beyond the domain of Romance philology.

Doubtless many have used the Dictionary for reference without reading the preface and its *complément*. They are well worth reading, especially the latter. The summary "Coup d'œil sur l'histoire de la langue française" is excellent in every respect. It is the clearest exposition of the subject that has been presented, giving in separate sections as much as many readers will wish to know on the grammatical rules of old French, ancient orthography and pronunciation, dialects, etc.

We have dwelt at some length upon this truly great and useful work of Littré. We have not hesitated to point out where it is relatively weak and unsatisfactory. To praise it as it deserves would demand phrases of admiration which might seem ill applied to a dictionary. We will say simply, using the phrase with all the meaning that it can bear: It is the best book of its kind. In conclusion, it is a fact worthy of notice that the French, who have not had the credit of being great searchers in linguistic and etymological subjects, have produced three such national works as the Thesaurus of Henri Estienne, the Glossary of Ducange, and this Dictionary of Littré.

## ROMANICA AND TEUTONICA.*

THE title of Professor Hillebrand's recent volume, which constitutes the second of the series, 'Zeiten, Völker und Menschen,' is slightly misleading. One might be led by it to expect a more or less systematic comparison of the spirit and institutions of Germany with those of the Latin races, a counterpart to Volume I., 'Frankreich und die Franzosen,' reviewed in the *Nation*, July 3, 1873; whereas the present volume is rather a compilation of detached essays, published at various times, and now recast into book-form. Its unity, so far as it can be said to have any, consists solely in the author's style, his way of looking at men and books. We state this, not to condemn but merely to characterize the work.

The first section, entitled "Renaissance," comprises three essays on Petrarch, Lorenzo de' Medici, and the Borgias. Then follow the essays upon Italy of to-day, namely, upon Manzoni, Guerazzi, Tommaseo, Carducci, and Guerrieri's Translation of Faust. These one hundred and twenty-six pages will be for the general reader doubtless the most attractive. We find in them the same freshness, the happy combination of ease and vigor, the suggestiveness, and above all the deep undercurrent of sympathy and taste, that gained our applause two years ago. Seldom indeed does one find a more charming bit of characterization than the introductory paragraph to Lorenzo de' Medici. The introduction to Manzoni, p. 60, is also singularly suggestive. It carries us back to the golden days of the Restoration, the Indian summer, as Hillebrand calls it, of the Revolution, when mankind drew once more a long breath after the hard fight, and gave itself up to the dreams of the muses. The eighty pages of essay upon France of to-day we can scarcely rank so high. The author's spirit has lost somewhat of its freshness amid the din and extravagance of Paris. His judgment of Michelet is sound, but it seems to us that he has overrated the importance of Prosper Mérimée. Judged by his 'Letters to the Incognita,' the Academician and Senator was a shrewd observer, a man of thorough culture and uncommon attainments, and a magical wielder of words, but he was not, in our opinion, a man to leave his mark upon the literature of his nation. He was an instance—and there are only too many such in every land and age—of a man who failed to achieve lasting results for want of concentration. Had he taken to heart Goethe's aphorism, that the master-artist is known by the limits he imposes upon himself, what might Mérimée not have accomplished! Gustave Flaubert, we may add, is treated by Hillebrand with even-handed justice.

In approaching the "Teutonic" portion of the volume, we pause—not exactly to remove our shoes before treading holy ground; the field over which Hillebrand leads us is strewn with the dry bones of false prophets, and especially with the dust of Gervinus, the Golden Calf of the Frankfort Parliament, "ground exceeding small." It is e'en a battle-field, and we shrink from venturing upon it. We always suspected that Gervinus combined the disagreeable features of the Philistine and the pedant; but we were not prepared for such a merciless analysis of his shortcomings. From sheer revulsion of feeling, we cannot help breathing a sigh of regret for the aged doctrinaire who went to his final rest grudging his country the political unity and glory that it had seen fit to achieve without him. The reader who wishes to inform himself upon the oddest phase of German politics, the rôle played by the professors and their satellites in 1848, and their fiasco, will find it set forth here with masterly acumen.

We pass by Hillebrand's trenchant criticism of Strauss, for that most bigoted of liberals has received already sufficient attention from our amiable theologians, and we hasten to a topic which seems to us the most pregnant in the entire volume. We mean the review of Nitsche's essay on the "Uses and Disadvantages of History for Practical Life." It lets us into a world whose existence we indeed suspected, but concerning whose movement we had little precise information. The problem, we might say, is momentous. We witness close at hand the reaction that is manifesting itself in Germany against the "historical sciences." The years 1866 and 1870 not only created a nation, they led a people to reflect upon its past ways. For a century, Germany had been taught to look upon its professors and *docents* as the flower of its intellectual vigor, the universities as the citadel of its greatness. The state officials, *Beamten*, were ignoramuses, the officers were hopeless dullards, put into the army because fit for no other place. All at once the greatest revolution since '89 is wrought, Germany's unity is effected, the victory won over its hereditary foe, and the agents in this work are—not the professors and the universities, but the despised officials and officers! What wonder, then, if every thinker capable of rising above the intoxication of the hour and looking upon success as a result to be studied rather than a phenomenon to be marvelled at, should become sceptical and impatient. What wonder if the nation, weary of over-much research in history and philology and over-little culture in practical life, should experience for its seats of learning a feeling not remote from contempt, a temptation to turn its back upon their methods and standards of excellence. We have not the space for recapitulating the points advanced by Nitsche and Hillebrand, much less for entering into a discussion of them. We advise our readers to read everything, rejecting nothing and accepting nothing unqualifiedly. The wave of criticism runs high, but we cannot decide as yet whether the tide is advancing or receding. We can only send to Germany a word of warning. So much has been said of late on the "failure of American institutions" that we are loth to add even the veriest mite to the stock of commonplaces. We do not believe that our institutions are a failure, but we do believe that they are undergoing the severest strain. One of the causes is obvious: the utter absence of "historic sense" in the American people. We may as well admit, once for all, that we have no feeling for continuity in history, that each generation takes up its problems of trade, finance, and politics afresh, as if there had been no generation before it and would be none after it. The gravest defect of our office-holders may be their want of honesty; but we are persuaded that the great majority of them desire sincerely to do the best they can. They are simply ignorant of what has been done or undone before them, and unable to calculate the resultant of forces good and bad now at work. In other words, they are not qualified for their mission by a careful training in historical subjects. Each man looks upon his office as a mere clerkship, and not as an organ in a complicated and ever-changing organism This evil has a twofold origin. It results from the want of connection between our centres of learning and our centres of political activity, and it also results from the shortsightedness of the colleges themselves. Not one of them perceives the importance of teaching American history thoroughly and with a view to influencing, in a scholarly way, the drift of public opinion. Before making rash innovations in their system of education, the Germans will do well to consider *how* it has come about that their office-holders are so admirably and so liberally trained, so superior to self and greed of salary, and whether too much study of history is not after all far safer than too little.

Concerning Hillebrand's remarks upon Schopenhauer, Prince Pückler-Muskau, and Varnhagen and Rahel, we have nothing but words of commendation. The reader will derive from them much enjoyment and no less profit. Like the sketches of the Italian authors, they seem to spring more from the heart than the head. The reviewer lays aside the weapons of angry controversy and sits down to a familiar yet instructive chat with us upon themes and persons which are to him the objects of deep affection. We call attention particularly to the sketch of Pückler-Muskau, a unique character in German society, a singular mixture of the dandy, the man of letters, the traveller, the Don Juan, and the unrivalled art-gardener. The portraiture will be to many of our readers an agreeable surprise.

*A History of Madison*, the Capital of Wisconsin, to July, 1874. By Daniel S. Durrie. (Madison, 1874.)—The capital of Wisconsin is a year older since this local chronicle was closed, but it is refreshing to learn in these centennial days that the city will be only forty years old in 1876. It was surveyed, that is to say, in October, 1836, on behalf of Judge afterwards Governor Doty, an early proprietor, who named the place after President Madison, as he did the county after Nathan Dane, author of the Ordinance of 1787, which, as our readers will remember, has been thought

* 'Wälsches und Deutsches. Von Karl Hillebrand.' Berlin: Robert Oppenheim; New York: B. Westermann & Co. 1875.

to be paramount to the present constitution and laws of Wisconsin touching the right of the Legislature to regulate railroad tariffs. The Territorial government was effectively organized July 4, 1836, and the first Legislature assembled in November, at Belmont. Judge Doty was there with his speculation in his pocket, and, by the judicious distribution of corner lots to the delegates, in less than a month he procured the selection of Madison as the seat of government, and such it remains in spite of a determined attack on the part of Milwaukee only five years ago. The Judge was then appointed one of the commissioners for building a State capitol, who immediately formed a ring with the contractor, and in 1840 were found by an investigating committee to have "done little more than erect a shell of a capitol, which is scarcely capable of sustaining its own weight, and which, unless it is speedily secured by extensive repairs, must become a heap of ruins." They had received appropriations amounting to $40,000, and had expended less than half on the public buildings. It is scarcely necessary to add that Judge Doty was their treasurer.

In the matter of legislatures, Wisconsin made, as we have seen, a bad beginning. That of 1840–41 busied itself in creating "as many offices as possible, so as to give a place to partisan favorites and friends to pay them for electioneering and to secure their votes at future elections; also, to get as much money as possible out of 'Uncle Sam' to circulate in the country." It was esteemed a great improvement on its predecessors, but the policy of plunder which it initiated "was the beginning of that system which was afterwards known as the 'Forty Thieves,' who ruled the Territory and State for years, on the principle 'to the victor belong the spoils.'" The Forty Thieves were still in existence in 1853, when "the first great railroad session of the Legislature of Wisconsin" was held, and when the Rock River Valley Union Railroad Company, of unsavory memory, was an applicant for State favors. They, and other thieves without a number, boldly frequented the headquarters of the company at Monk's Hall, were fed there and "took liquid beverage"; "rates were fixed with various appliances, and nights were often made hideous." Do Mr. Potter and his colleagues ever look back on this time?

Of the judiciary even more astonishing stories are told than of the legislature, and some very amusing ones; but we have no space for them. Nothing is more grotesque than the first glimpse of the U. S. civil service in the wilderness of Dane County. In 1837, Mr John Catlin was appointed postmaster of Madison under Van Buren, and his deputy opened the mails and kept the office "in Mr. E. Peck's house, his being the only family in Madison." This house was "a hastily-patched-up log-hut, consisting of one room about twelve feet square." In 1841, on the coming-in of Harrison's Administration, Mr. Catlin was removed on political grounds with as much promptness as if he had been postmaster of New York or Boston. How much the town had emerged meantime from its primitive condition appears from an anecdote of a certain English doctor, who visited it in 1842, and, after a day's hard experience of its rawness, sparseness, mud, and visible drunkenness, said to his cicerone: "John A——! if you tell anybody that I *ever was in Madison*, by ——, I'll kill you!"

Many are the quotable stories with which Mr. Durrie adorns his pages, and curious are the personages who figure in them. Not only was Madison the birthplace of Miss Vinnie Ream, but of Miss Wisconsiana Victoria Peck; and here also flourished in the pioneer days the "pardners" in industry and in dram-drinking—Jonathan Butterfield, of Vermont (a great many of the first settlers of Madison were from the native State of Park and Fiske), and Pinneo, whose Christian name is not given. They carried on together a shingle factory, and independently stopped work whenever liquor was obtainable. "Near our house," says one of Mr. Durrie's informants, "stood a large oak-tree, the one under which Mr. Peck's family had camped when they first landed in Madison. This was a beautiful tree, valued for its shade as well as for its beauty and from association. Butterfield knew how we prized it, and when *strapped*, and his credit gone, his last resort was an onslaught on the old tree with an axe, and the only condition on which he would stop from damaging it was to give him an order on Nelson's or Than's grocery." Butterfield was a bad fellow, and his partner knew it:

"When the first minister visited Madison, and called the good people together on Sunday, Pinneo was among the first present. He listened attentively to the opening services, and when the minister began to speak of a better life than men were leading in the new country, Pinneo very deliberately rose from his seat and electrified the small audience by saying: 'That's so, Mr. Philo, that's so. Butterfield's got to be saved; and you just hold on till I bring him in.' Upon which he stalked out of the room; but, failing to find his chum, neglected himself to return."

*Fruit between the Leaves.* By Andrew Wynter, M.D., M.R.C.P., etc. In two volumes. (New York: Scribner, Welford & Armstrong. 1875.)—We do not profess to understand Dr. Wynter's title, but we cannot deny having been much entertained by his book. This may be described as a compilation of out-of-the-way facts upon familiar subjects. Dr. Wynter's skill in getting up a subject and raking together curious information is most commendable, and though his style pretends to no greater purity than is convenient for the lighter magazines, his two pretty volumes may be pronounced equally useful and agreeable. Dr. Wynter is apparently a walking encyclopædia of so-called practical knowledge; his brain seems stuffed with those secondary and tertiary facts which constitute the filling in, and as it were the padding, of the central masses of science. We are oppressively reminded, as we turn his pages, of the vast and daily increasing number of things that demand to be known about, and what a serious matter it is constantly becoming to attempt to appear well-informed. Dr. Wynter discourses upon such topics as "Clever Dogs" (the strictly canine, not the human); the idiosyncrasies of "Female Convicts"; "How and where Toys are made"; the "Skeleton Trade," and the manner in which it is kept up; the economy of life-boats; the habits of the domestic—the too domestic—rat; "Tunnels and Tunnelling"; the innumerable forms of adulteration of food and drink; the final destiny of what goes into dust-bins and ash-barrels; the eccentricities of cats; the question whether bad odors cause disease; the gruesome mysteries of infanticide, as practised in the serving classes; and various other lowly themes which, partaking at once of the commonplace and the recondite (so that people are apt to assume both that they are not worth knowing about and that they themselves know all about them), might easily lack a chronicler if it were not for Dr. Wynter's taste for curious and, in some cases, unsavory detail. With the growing complexity of our civilization, every object around us is getting to have a history and to play a part—often even to have a literature and a special science of its own. We have been interested to read that the thumbs of kid-gloves are often made of rat-skins; that, if the rat is for ever gnawing, it is not from wanton destructiveness, but in order to wear down its incisor teeth, which are for ever growing upward from the root, and threatening to penetrate the opposite jaw; also, that these unfortunate animals (as if this did not give them enough to do) begin to litter at six months old, and produce four litters a year, of an average of eight to a litter. Writing of "Precious Jewels," the author mentions an episode in the career of the famous "Sancy diamond." It was sent by a person owning it in the fifteenth century as a present to the King of Portugal. The servant carrying it was attacked by banditti, whereupon he immediately swallowed the stone to save it, and on his death only it was restored to the light. The servant and the diamond, if the latter was none the worse, were about equally to be complimented. Writing of tunnels, Dr. Wynter reminds us of the project of an ingenious French engineer, M. de Gammond. "This gentleman, in addition to laying down the tube, suggests a great ocean station, midway in the Channel. Here he proposes to have a harbor and basins, into which any home-bound ship may enter and discharge her passengers by means of a huge shaft, three hundred and thirty yards in diameter, opening into the tunnel, and giving egress to both England and France." If M. de Gammond's name were spelt a trifle differently, we should be inclined to suspect him of being fond of his little joke. Into the mysteries of the adulteration of food Dr. Wynter dives deeply, and brings up some astounding disclosures. Gunpowder tea, for instance, "has often but little tea in it, being composed of sand, tea-dust, dirt, and broken-down portions of leaves, worked together with gum into grains. When it is intended to mix it with 'scented caper,' this stuff is 'faced' with blacklead; when with gunpowder, turmeric, Prussian-blue, and chalk are used." But the genesis of "coffee" is sometimes even more appalling. "Mangold-wurzel, roasted wheat flour, red earth, roasted horse-chestnuts, and we are even told that in some neighborhoods baked horse's and bullock's blood, are used for this purpose . . . . In various portions of the metropolis, but more especially in the East, are to be found 'liver-bakers.' These men take the livers of oxen and horses, bake them, and grind them into a powder, which they sell to the low-priced coffee-shop keepers." It is perhaps equally pleasant to learn that "the most delicate and delicious essence of jargonel pear-drops and essence of pine-apple are made from a preparation of ether and rancid cheese and butter." In the paper entitled "Dust Ho!" the author enumerates a multitude of minute facts in the small economic line; as that dust-contractors are almost always brick-makers as well, and use the refuse of their refuse in their brick-yards, that old greasy dish-cloths and other filthy rags make "beautiful" manure for hop-gardens, that the worthy Frenchman who set the fashion of picking up and selling the scraps of bread in the *cafés* to humbler establishments, be-

thought himself, thriftily, of manufacturing "tooth powder" out of the burnt portions of the crusts. It seems decreed that everything in the world shall, sooner or later, go into our mouths, in some form or other. Dr. Wynter, touching on a heavier theme, relates that it has been accurately estimated that there are some twelve thousand women, who have murdered their infants, now resident at liberty in London. As to the basis of this computation he gives some hideous particulars, mentioning among others the extraordinary number of children who come into the world still-born on washing-day. But we forbear: this subject should be talked about either thoroughly or not at all.

*History Primers.* Edited by J. R. Green. History of Greece, by C. A. Fyffe, M.A., Fellow and late Tutor of University College, Oxford. With Maps. (New York: Macmillan & Co. 1875. 32mo, pp. 127.)—One wonders at first thought how there can be any demand for a new historical series by the side of those of Mr. Freeman and Mr. Morris, but Mr. Green's series seems designed to be much briefer and more elementary than either of the others. The editor's name carries nearly as much weight in favor of his undertaking as Mr. Freeman's, and some of the names of authors are well known and of high rank—Mr. Freeman and Mr. Green themselves for European and English history respectively, Miss Yonge for French, Rev. Richard Morris for English Grammar, Dr. Farrar for Latin Literature, and Rev. Stopford Brooke for English Literature. Mr. Fyffe's 'History of Greece' is an exceedingly good compendium—well arranged, clear, and simple in its style, and, above all, not burdened with an infinity of detail. One is much struck, on glancing through the pages, with the very small number of proper names introduced. This we regard as a merit of the first order, by virtue of which the book is made interesting and suggestive in a very small space, with at the same time no sacrifice of really important matter. The maps are, we suppose, as good as could be expected in so small and cheap a book; there ought, however, to be a brief table of dates.

*NEW YORK, THURSDAY, JULY 8, 1875.*

## The Week.

THE Tilton-Beecher trial ended just six months after it began, and the jury, as was becoming, stayed out seven days, and then, having incurably disagreed, were discharged, Judge Neilson, true to the traditions of the place, hoping they "felt kindly." The fear that somebody may "feel unkindly," or that somebody's "sentiments may be embittered," seems to hang like a black cloud over Brooklyn life. Characteristically, too, the clerk of the court asked the jury to stand up and be photographed at the close, but two of them objecting, the scheme was given up. The whole thing has been conducted from first to last in the most melodramatic style. The jury are said to have stood nine for Beecher to three for Tilton, and to have differed on the veracity of the witnesses, as well they might. There probably never has been a case, except the Tichborne case, in which the jury was in greater need of a good charge, reviewing the evidence, and picking out from it the essential points; but this they cannot be said to have received, and they consequently went into the jury-room undoubtedly in a state of considerable bewilderment and staid in it until the close. The members were twelve plain men, without much education or mental training of any kind, and wholly unused to carrying long or complicated transactions or arguments in their memory. During six long months they were kept listening to a host of witnesses, who were examined and cross-examined at inordinate length, to four speeches lasting about ten days each, in which all the facts were enveloped in a cloud of rhetoric, most of which, instead of being expository, was savagely denunciatory. Anything better calculated to bemuddle the brains of the average man it would be difficult to devise. From this confusion it was the duty of the judge to extricate them by something in the nature of an orderly legal narrative, separating the wheat of the bar from the chaff, but Judge Neilson fell very far short of furnishing it. The case has been reviewed, evidently by a master-hand, in the New York *Times* of Saturday last, and nowhere else adequately that we know of. We strongly advise any one who wishes to get a clear view of the evidence and its bearings to read that able statement. It leaves nothing worth saying to be said, and its conclusions, as far as they go, are those which we believe will be those of every careful and intelligent man a month hence. Nowhere else have the important points been extracted and set out in a clear light.

---

The "working up" which the Loader-Price perjury case has been receiving from the reporters and the lawyers gives it the appearance of a great deal more importance than it has. It was nothing surprising, in a case in which so many queer people had been produced to tell strange stories on the witness-stand, that two scamps, who were "down on their luck," should try and contribute a little tale of their own for the chance of a few dollars. As they never appeared in court, and as their story was on its face grossly improbable, and their character broke down at the very first enquiry, the affair was hardly worth mention. But the Beecher side instantly seized on it as something tremendous got up by the Tilton fiends, and a fair specimen of all their evidence, and gave out that they would probably indict Moulton and Tilton for conspiracy. Whereupon, Moulton published a card challenging the Beecher "minions" to touch him, and Loader and Price received a scathing in various editorial articles, and so the whole thing became ludicrous as well as disgusting. If we might now offer advice to the *dramatis personæ*—Frank, Emma, Dorey, Lib, Bessie, Gussie, Brother Shearman, and the rest of them—it would be to withdraw themselves, temporarily at least, from the public gaze. We would even counsel a brief abstinence from "talks" on Friday and other evenings and all public praying and weeping. The tears have flowed too long down all sorts of cheeks, and the "Lord has been blessed" too often for a great many things the Lord by no means concerns himself about. Let us now have rest and peace and decency, during the hot weather at all events.

---

The summer hegira has its usual quieting effect on the financial markets. Most of the *habitués* of Wall Street have departed for the watering-places, and the still large figures which appear on the stock list are due mainly to a few leading operators, who seem desirous of keeping up appearances of activity. The gold and exchange markets are kept in a feverish condition by an uncertainty as to how far the payment of five-twenties for the Sinking Fund may force gold out of the country. About $20,000,000 of the bonds "called" for this purpose have been paid, and it is estimated that the remaining $10,000,000 are owned abroad. As bills are very scarce, and the rates of exchange are now at the specie-shipping point, it seems quite possible that we may have to settle for this maturing indebtedness by shipments of specie. During the week ending July 3, we exported from this port $3,238,000 of specie, mainly gold coin. Considering the comparative lightness of the stock of gold on the market, and the diminished amount owned by the Treasury, the largeness of the current export of the precious metals is regarded with unusual interest. Under ordinary circumstances, this state of things would have been comparatively immaterial; for the flow of our gold into the Bank of England would have produced an ease in the London money market that would have made an immediate opening there for a few millions of our securities, and these would restore the equilibrium of the specie movement. But, with the extraordinary circumstance of the rate of interest being lower here than at London, our exportable securities are too high to admit of their taking the place of gold in the exports; and therefore this element of relief does not come into play. For the sake of getting rid of an anxious problem in the exchanges, it is to be hoped either that the reaction following the late English credit panic may produce a lower rate of interest at London, or that a revival of business here may induce a more active money market at New York. The enforcement of the Resumption Act of last January is becoming an important element in the condition of the currency, little felt, however, under the extraordinary ease in money. The legal-tender circulation has been reduced $6,160,000, as against new issues of bank-notes, and the fractional currency has been contracted $4,261,000 up to the 1st inst.; making a combined diminution of $10,421,000 in the two forms of currency under the operation of the Act of January 14, 1875. The Secretary of the Treasury has purchased a considerable amount of silver, for coinage, to be issued in place of the fractional currency thus retired, and he is selling the "new fives" privately to reimburse himself for outlays in silver and cancellations of greenbacks. The Government will sell five millions of gold coin this month; but it is unofficially intimated from Washington that Mr. Bristow contemplates instituting, as early as possible, a policy of hoarding gold preparatory to the resumption of coin payments fixed for January 1, 1879.

---

The falling-off of some of the railroad dividends in Massachusetts and of some of the manufacturing stocks has no doubt given some people the idea that we have not yet got to the "bottom" of the panic. An examination of the figures, however, shows that there is really very little cause for apprehension. The total amount of dividends payable in Boston, on July 1st, as given in the *Transcript*, was $9,889,540, against $9,117,378 payable a year ago, or, in other words, an increase of about three-quarters of a million, and we find that we have to go back to January 1, 1873, before getting to a period when there was any very substantial difference between dividends as they are and dividends as they ought to be.

At that time they amounted to $12,083,034. No doubt, an examination of the figures in other cities would show similar results; *i. e.*, a great falling-off in the year of the panic, followed by steady though smaller payments, with signs now indicating a stronger "tone." The fact is that some of the gentlemen who get up the financial news for the world have an unfortunate habit of looking only at one side of this market at a time—now examining the condition of the manufacturing stocks and railroad dividends, without regard to the bond market, and now reversing the process. This year, while the two former may have fallen off, the latter has improved, and no one who has any securities can look over the list of railroad bonds just now without finding that one or two roads he takes a warm interest in are beginning to pay what they owe.

---

The dishonesty of the godlike farmer of the West, who has for the last three years been amusing the world with his horror of the wickedness of railroad stock and bond holders, seems likely at last to be in some degree arrested by the law. In Illinois, as in other States, the holy man has for some time past made a practice of issuing town and county bonds for all sorts of purposes. Sometimes they were to help him to get railroads made in the vicinity of his farm, sometimes for other local improvements. After getting the railroad, he has been very apt to refuse to pay the bonds, on the ground that he had no right to issue them, that he did so thinking the railroads were public institutions, but, having found out that they were strictly private corporations, he felt awfully sorry, and must solemnly repudiate. Sometimes, if this plea did not avail him, he would begin to weep and wail and say that the stock was dreadfully "watered," and that he felt that he owed it to posterity to default both on his interest and principal. In other cases, however, in which he received the money, he has refused to pay a cent simply because paying is not pleasant. Several counties in Illinois actually refuse to pay their creditors, not because they are unable, or because they have any complaint to make of the manner in which the debt was contracted or the money spent, but because they won't. They have been sued and judgment obtained, and the supervisors have refused to levy the necessary taxes and set the creditors at defiance, to the delight of their pious constituents. At last an attempt is being made to hold the officers personally liable for refusing to do their duty. The supervisors of Macoupin County have been fined for failure to obey a mandamus. The county paid the fine, but the court handed the money over to its creditors on account, and attacked the supervisors again, and now civil suits for damages have been begun against them for negligence. There is thus a fair chance that the rogues will at last be brought to justice, and these extraordinary communities receive a practical lesson in ethics which may prove of inestimable value to them. We advise all bondholders or investors at home and abroad to watch these cases. They are really to them of vastly more importance than statistics about corn or hogs or coal-lands.

---

The committee which has been investigating the affairs of the Chicago, Dubuque and Minnesota, and the Chicago, Clinton and Dubuque roads, have made another report, which will be of interest to bondholders generally. It will be remembered that these roads were dependencies of Chicago, Burlington and Quincy, and were built or half-built out of the proceeds of bonds which the directors of the main line offered to the stockholders, and which were taken by the latter on the strength of representations made by the former. There was, however, at the time a secret construction contract which was not made known to the purchasers, but which gave to the directors an interest adverse to that of the stockholders. The bondholders have taken the opinion of Judge Hoar as to the question whether this transaction can stand, and he says that it cannot. It appears to him, he says, to present a case of directors, entrusted by stockholders with the management of their property, offering to the stockholders certain securities on the ground that purchasing them would be for the common interest, and with the obvious understanding that these officers were prepared to join on equal terms with the other stockholders in making the purchase, while they were in fact jointly interested in those very securities, and the sale of them was for their own account and benefit. He cannot believe, he adds, that such a transaction would be supported by a court of equity.

---

We published some time since a letter from Mr. Joy on this subject, in which that gentleman, who seems to have been mainly responsible for the peculiar system on which these roads were built, maintained that whatever mistakes might have been made (and he had no doubt that he, like other men, had made mistakes) everything had been done in good faith, and therefore it was very unfair to find fault with him. On this point the source of misunderstanding between shareholders and trustees seems to be a good deal the same as that between the public and the politicians. The politicians, whenever there are such exposures as the Crédit Mobilier or the Sanborn contracts, immediately bring forward the most conclusive proofs that their only object in the whole affair was the completion of a great highway, or the collection of the revenue, and so the stockholders generally find that their trustees have with perfect good faith invested their own funds in the same speculation, the object of which was the development of some "system," or the perfection of some "line of communication." But we hope that Mr. Joy will notice that the opinion of Judge Hoar declares that in a court of equity the absence of fraudulent intent will make no difference; for, says this cold-blooded jurist, "he who recommends and professes to join with another in a purchase cannot, I think, have an undisclosed interest as the seller without becoming liable to the consequences," which in courts of equity are the rescission of the contract and much pecuniary loss.

---

This year has given a good many proofs of the genuineness of the reconciliation between North and South, and none of them have been more to the purpose than the gloomy laments and bitter denunciations indulged in here and there by what remains of the Southern irreconcilables. There are, it seems, a few of these gentlemen still scattered about the South—men who still keep alive the memories of "the lost cause," and who deeply regret not having been able to welcome with "hospitable hands" to "bloody graves" the mudsills of the North. One of these, Mr. J. S. Preston, has just been delivering a semi-centennial oration at the University of Virginia, in which he showed how irrepressible was the conflict between the gentlemen of Virginia and the Puritan outlaws of the *Mayflower;* how the South had fought for land, liberty, and self-preservation, and so on; and though at the end of his speech he tried to take a cheerful look at the future, saying in the strange, old-fashioned Virginian tongue: "But for you, nurselings of to-day, still at our mother's breast, I would change this sad and weird lament, this gloomy chant of woe, and strike the resounding chords which send forth the bold anthem of hope, and give to you a cheering and a living echo from the dark vault of the past," still it must be said that the general tone of his remarks is not enlivening or hopeful. Indeed, the future, if we are to believe Mr. Preston, is even blacker than the past, for he assures us that "not space, or time, or the convenience of any human law, or the power of any human arm, can reconcile institutions for the turbulent fanatic of Plymouth Rock and the God-fearing Christian of Jamestown," and declares that "you may assign them to the closest territorial proximity, with all the forms, modes, and shows of civilization, but you can never cement them into the bonds of brotherhood." So, too, the recent declaration of Semmes of the *Alabama*, that he will not come back to the Union until the foul blot of the Fourteenth Amendment is wiped off the Constitution, shows that here and there linger on at the South some of the old fanatics, ready to eat fire at any time at their country's call, just as there are a few kindred spirits at the North, who blaze forth every now and then with a fiery zeal on the subject of the wrongs of the negro and the Union man. But, to the nurselings of

to-day, their weird lament and gloomy chant of woe, as Mr. Preston finely says, have little meaning.

Mayor Wickham has addressed a letter to the "Short-Hair" laborers who have been clamoring for an exceptional rate of wages from the city, explaining why they cannot have it. He points out that when the times are better wages will probably be higher, and that the recent reduction is not only made necessary by the fall of the market rate, but by the condition of the municipal finances, and that the lower the rate of wages paid, the more laborers the city can afford to employ. He also very forcibly and pertinently says:

"Public moneys come out of the pockets of the taxpayers; the ultimate and real taxpayers are the tens of thousands of members of the great laboring class, of which the comparatively few men employed by the city upon public works are but a small part; the wages of that small part are really paid out of the pockets of the rest of the laboring class; and it seems plain, therefore, that that small part would, if their wages were largely over the market rate, be only a small *privileged class*, living, to the extent of the excess of their wages, upon the *enforced bounty of their brethren*, in the shape of a free gift from the public officials. Under those circumstances, the heads of Departments asked themselves these questions: If a public officer can give away a few dollars of public moneys, what limit is there to his powers in that direction, and what is to prevent him from giving away a million? But would that be anything better than stealing, and would an honest and enlightened public officer addicted to practices of that kind be anything better than a thief?"

He closes by declaring that neither John Kelly nor the Democratic Aldermen had anything to do with the reduction; on the contrary, they advised against it, showing themselves to be true popular "statesmen."

Ireland has been thrown into great excitement by the visit of the American Rifle Team, and still greater by their victory in the international match. The Irish Team, which seems to have been deficient in preparation, shot badly from the beginning, but shot worse as they went on, owing most probably to nervousness caused by the excitement and rage of the crowd, who could not submit calmly to the defeat of the native champions, but for a wonder did not accuse them of having "sold out." Nothing has occurred, however, to mar the pleasure and triumph of the Americans, and in later matches the Irish Team has shown more skill or had better luck, four of the members having defeated the four best of the Americans in the contest for the "All Ireland Challenge Shield" by six points. The probabilities are that the affair will give an immense stimulus to rifle-shooting, as the Irish club holds the Elcho Challenge Shield, which it has carried off from the English clubs. But much of the talk about the "international" character of these matches is sad stuff. One Dublin paper, for instance, apologized for the defeat of the Irishmen on the ground that the American riflemen were selected from a population of 40,000,000, while the Irish were selected from a population of only 5,000,000, the fact being that neither club is the product of any selection whatever, or of anything but an accidental love of this species of amusement on the part of a few individuals in each country. The work of preparation would have to spread through a much greater proportion of the community before any team could be taken as a fair expression of the national capacity.

Dean Stanley has been creating a good deal of amusement among the cynical in England by making a speech at the Newspaper Fund dinner, in which, in the course of a glowing eulogy on the press, he compared the effort of writing a leading article "to the tension and energy compressed into the attitude of the crouching tiger," and the articles themselves to the chapters in the Koran called "Terrific Suras," because Mahomet's hair turned white while he was composing them, and some other matter of the same sort. The *Pall Mall Gazette*, writing on his speech in its best style, suggests to him that he is probably impressed so deeply by the difficulty of writing for the newspapers because it is work to which he is not accustomed; that the facility which journalists have in writing on a certain class of subjects at short notice is simply due to the fact that the subjects are those which occupy most of their thoughts, or of which their minds are generally full, and, in short, closely resembles the facility a lawyer has in taking charge of a case in court after a very short examination of his brief, which so often strikes laymen as very wonderful. It resembles also the facility with which a politician in Parliament maintains himself in debate on half-a-dozen subjects, at which nobody seems to wonder. In fact, there are but few persons who write with as much deliberation, and with as much familiarity with their subject, as a journalist of the best kind. The other kind, which is what a great many people have in their mind when they talk of journalists—that is, the man who, knowing little or nothing of any subject, is always ready to write at a certain rate of pay on all subjects—is hardly worth analysis, and plays a much smaller part in the conduct of the better portion of the newspaper press than is generally supposed. Still, he receives from even the papers of the highest grade an amount of encouragement which is very discreditable to them. But, then, there are no "crouching tigers" in any newspaper office, and the composition of "Terrific Suras" is so rare that it may be said, for practical purposes, never to occur; though there is at least one morning paper in the city whose editorial articles occasionally bear marks of having been composed under terrible excitement.

The political news from England has but little interest. The incident which has attracted most attention of late is a warm suggestion of an Anglo-Russian alliance from the *Golos*, which thinks England and Russia could get on passably well together if England would only admit the right of Russia to push her frontier to the top of the Snowy Range, which, it maintains, would really strengthen English rule in India by removing all further danger of insurrection, and, by removing the last real ground of hostility or suspicion between the two powers, leave them free to act together cordially and without *arrière pensée* in European politics. Apropos of this, the *Economist* of the 19th ult., treating the subject on which we touched last week—the military capacity of England in relation to the Continent—maintains that the growth of population has carried her up much nearer to the level of the Continental powers than she was in 1815; that she therefore has no need, as she had then, to fear any one of them single-handed; and, consequently, does not need to trouble herself to effect and maintain the combinations in the interest of the balance of power which were necessary to her safety in the Napoleonic wars. This view, however, would need the extension of the Continental military system to England to make it sound. As matters stand, England is relatively weaker for military purposes than she was in 1815, and the comfort the *Economist* draws from the rapidity with which the North raised armies in 1861 is obtained by overlooking the fact that the North was arrayed against a foe no better organized than itself. In fact, the uselessness of mere size of population for defensive purposes under the modern system of warfare is well shown in the case of France at the present moment. It is calculated that it will take at least seven years from the present date to enable her to fight Germany with a chance of success.

On the Continent there prevails great calm. In France, the Assembly is still occupied with the prospect of a dissolution, which the Left begins once more to push vigorously, but the only recent breeze has come from the discussion over a bill to release the universities from state control, in which the Clerical party is intensely interested, for the same reason it is interested here in getting the common schools out of the hands of the state. At the same time, the state in France has been sufficiently unsuccessful as an educator to ensure the bill a considerable amount of support from parties who are not troubled about materialism. The principal debater on the side of the bill has been Bishop Dupanloup, who carried on the discussion, in characteristic French style, by reading materialistic passages from the theses of students, amidst groans and interruptions from the Left.

## "THE SCHOLAR IN POLITICS."

IT has become the fashion, and it seems to be becoming more and more the fashion, to give the speeches, addresses, and sermons which are called forth by the various commencements a distinctively political character. The part played by "the scholar" in politics, the part he might play, and the part he ought to play, are dwelt upon with increasing fulness and solemnity, and the series of Revolutionary anniversaries on which we have just entered have naturally given fresh attractiveness to the theme. Almost every college in the country, and many of the collegiate associations, have during the past weeks been calling the attention of graduates to their political duties with more than usual energy and power, and presenting politics to them as what it really is—one of the highest objects of human interest. It is true that most of these addresses are somewhat melancholy in their tone. They take a dark view of the moral condition of public affairs, and draw pictures of the morals of public men which make it plain that the duty they assign to reformers is no light one. They do not treat the political scandals of the day as merely the inventions of a "licentious press." After making all allowance for exaggeration and misrepresentation, they acknowledge the existence of much corruption and of a widespread corruptibility, and of a lowness of tone which verges on corruptibility, and prepares the way for it, and they call for the vigorous direction of the conscience of the nation to the work of political purification as a condition of national salvation. Most of this exhortation is very eloquent and acute, and the occasion which calls it forth is pretty sure to make it earnest. There is something in the annual collegiate reunions by which every man who attends them, whether he be a university man or not, is sure to be touched, and which is sure to infuse tenderness and solemnity into the tones of even the coldest speaker. The eager and joyous rush of the new graduates out into the world is to the older ones full of a stern suggestiveness. There is perhaps hardly any spectacle which reminds an old or middle-aged man so vividly of his own errors and shortcomings, of his lost opportunities, and his faded hopes; and even when he has a thoroughly successful life to look back upon, he is happy as few are happy who can return in memory to college-days without passing over the thorns of much sorrow and disappointment. And then the older men know, as the young do not, how much depends on a good start, and how much of the weariness and despair of later years comes of having turned off or rested at the wrong point. It is seldom, therefore, that anybody undertakes to talk either to the outgoing class or to the old classes, reunited as well as time and death and care will let them be, without having his blood stirred by visions of great possibilities and great responsibilities, and without fancying, not in pride either but in tenderness, that something he can say may make the journeying of the new generation a little easier and a little more fruitful than that of his own has been.

The most prominent among the addresses of this year has been that of Dr. Woolsey before the Phi Beta Kappa Society at Harvard, and, apart from the matter, the speaker's years and experience and the austere vigor of his character gave it more than the usual interest of such discourses. He had the old story to tell of the condition of public life, but his remedy was still older. It consisted neither in the appearance of the "property-holders and substantial classes" at primary meetings, nor in the abolition of the caucus, nor in minority representation, nor in any other of the little modifications in machinery which have of late years been so persistently urged on the public attention as panaceas (although he did not wholly reject any of them), but in the cultivation by each man for himself of a higher standard of personal honor, in politics as in other things; and he showed very clearly that could a greater number of men be brought to think more seriously about the effect of their doings on their own souls, we should have a lever which would raise the whole body-politic to a higher moral plane.

Now, this is excellent and unimpeachable. We shall have no real reform in politics until the number of those who will neither do, aid, abet, or connive at dirty tricks, for any purpose whatever, is greatly increased. But then it does not go far enough. We might, in our opinion, increase the number of such men fifty or one hundred fold, and yet make no sensible impression on the tone of public life. As the work of political reform, or rather, as the work of interesting good men in politics, and of bringing personal purity to bear on politics, is now carried on, its main result—we will not say its only result—is to increase the number of preachers against corruption in the abstract. We must confess we think the work of denouncing corruption is already pretty effectually done. The hostility to corruption is already deep seated and widespread. You find it in cheering strength in every part of the country, and you find along with it a most encouraging determination to "elect none but good men to office." Nevertheless, corruption continues to exist, and penetrates deeper and deeper from year to year. The "licentious press" is blamed for painting it in too dark colors, but we may with confidence ask any man "inside politics" whether the pictures of the press are not on the whole rather under than over drawn. There are more articles against it in the papers, more sermons against it in the pulpit, than ever before, and yet in spite of sporadic risings against it in some of its most flagrant forms, nobody can pretend that it has so diminished of late that the popular ideal of the politician has undergone a marked change, or that any new or better spirit has come over the relations of our public men to the country. Look, to go no further, at the attitude of the late Congress towards the civil service! Could anything well be more selfish or more degrading?

Now, why is this? Why does the preaching bear so little fruit? Why is it that the improvement of tone about politics and the deeper sense of responsibility which have unquestionably shown themselves among educated men during the last fifteen years, do not produce more marked amendment? The reason we take to be this: Politics, like the rest of human life, is made up of one-fourth opinion or sentiment, three-fourths of conduct. Conduct is composed of the acts of particular men. All denunciation, therefore, which does not touch conduct is apt to be idle, and any attempts at reform in which allusion to persons, or criticism of persons, or illustration by persons, is avoided, are sure to fail or nearly fail; and that most of our attempts at reform by our high-toned men have this defect there is no denying. When things have reached the pass they have reached among us at this juncture, it becomes the duty of the reformer, not so much to preach purity as to give reasons why Smith or Jones must be got out of the way; and this is an unpleasant task, which the "scholar in politics," like other people, not unnaturally avoids if he can. He is willing enough to lecture against rascality, or even, on a pinch, to attend a primary meeting, or to distribute ballots at the polls, but he is not willing to single out a political rascal and pursue him night and day until he makes public life too hot for him. Every one, in fact, is so occupied in keeping his sentiments pure, and furbishing up his opinions on government, that nobody is willing to go down into the crowd and collar the knaves. The "practical man," who attends conventions, has just as little stomach for this sort of work as the scholar. In fact, in order to stay "practical," and get returned to the conventions, and have any influence on nominations, he has at least to pretend to be something of a knave himself, and not to be easily shocked. The consequence is that the knaves flourish, and are willing that the preaching should continue indefinitely. As long as the better men are so afraid of hurting their feelings or "embittering their sentiments"—are afraid, in short, of personal application—there is no reason why they should be disturbed by it. Good-nature, in all its ramifications, has been made so prominent a feature in our school and social training that the capacity for withstanding a trickster or intriguer or demagogue to his face has almost died out amongst us. A striking illustration of this weakness is in fact furnished by the relations of many of the most prominent clergymen to the press. They preach against its shortcomings and enlarge on its responsibilities nearly every Thanksgiving Day with great fervor, and exact from political

editors the loftiest heroism and devotion to the general good; and yet when a publisher who notoriously makes his paper an instrument of the grossest corruption, sends them a check for the copyright of a few sermons, or a slight bit of moralizing, that he may have the benefit of their name to help him in pushing his trade, how many refuse it? How many remember, when the case is thus brought home to them, that they too are bound in small things as well as in great, indirectly as well as directly, to shut out covetousness and deceit from helping to mould public opinion, and to reserve the prominent and influential places for men whom they would have their sons admire and imitate? When, again, we see, as we do see every day, men beginning a political career with trickery, achieving success in it through "management," climbing into one high public office after another without knowledge or even affectation of knowledge, without interest in or association with a single measure of useful legislation or one question of social reform, without even making the slightest contribution to political thought beyond an occasional burst of flatulent admiration for universal suffrage, how many men of culture are willing to come down and denounce, expose, or oppose them, until not only their hold on public life has been shaken, but until their way of succeeding has been made difficult and discreditable? We fear, very few. The dangers and temptations and difficulties of such work there is no disguising. It is apt to involve almost as much waste and injustice as war itself, and yet, in spite of this, will have to be done in democratic communities if democracy is to reach anything which rational men will be willing to call success. The race of ignorant political adventurers and intriguers has risen into power, and holds the government in its hands, because better men are content to paint political ideals, and refuse to make personal applications of their own teachings, or often to suffer a little personal inconvenience in order to abate at their own door the very nuisances they have been denouncing in the pulpit.

## THE PREVENTION OF LOCAL EXTRAVAGANCE.

ABOUT ten years ago, at the close of the war, the question of municipal indebtedness first began to attract public attention. Unfortunately, political discussion was then carried on on such a simple plan that the matter really failed to attract as much attention as its importance deserved. The publication of statistics showing that the local indebtedness of the United States must be counted by hundreds of millions and really amounted to a second national debt of no small magnitude, was met by the reply that the disseminators of these unpleasant facts were Copperheads, and that their statistics were in the nature of rebel lies. Since the settlement of the Reconstruction problems, however, the question has begun to attract more notice, and in hardly a State has there not been a movement of some kind to restrict or put an end to the power of local bodies, like towns, cities, school districts, and counties, to run themselves into debt. In Connecticut, a constitutional amendment prohibiting such bodies from giving any aid to private corporations has just failed; but the movement is to be renewed, limiting the restriction now to railroads instead of making it embrace all private corporations. The figures of the Connecticut municipal debts are $13,995,000, of which more than a third is said to have gone to railroads. According to the Census of 1870, the county debts of the United States amounted to $187,565,540, the city and town debts to $328,244,520, and the State debts to $352,866,698—making in all the sum of $868,676,758. It may fairly be assumed that these figures are under rather than over the mark, as local debts increased from 1870 to 1873 at an alarming rate, and if we had the true figures we should probably find them to be above $1,000,000,000—a sum which would make quite a respectable national debt for a sovereign state.

There can be no doubt that the extinction, or at any rate the enormous reduction, of this debt is a question which must sooner or later be met by the various States. The United States, alone among modern countries, has adopted a consistent policy with regard to its national debt—that of paying it off. But it would be a ludicrous piece of inconsistency if we were to start at the same time on a career of national economy and local extravagance. It is easy to see that with the double sovereignty of the States and the United States we might secure all the so-called blessings of a national debt without the nation's owing a dollar—a debt for which it would be just as difficult to find the interest, and which would cripple us just as much. If we really mean what we say when we talk of the policy of the country, we must not content ourselves with the monthly published statement of the Treasury showing the reduction in the debt, but must ask ourselves, how much has the total public debt, including the national, State, county, town, and school indebtedness, been decreased in that time—how much less are we taxed than thirty days, or even a year, before? If statistics of this sort had been published for the last ten years, we should perhaps see reason to modify our views as to the reduction of the total indebtedness of the country.

There are, at present, three modes of meeting the question of city and town indebtedness in the United States. The first is to ignore its existence; to trust, that is, to the virtue and economy of the various towns and cities to prevent extravagance. On the face of it, this seems the true solution. Theoretically, the people of a town or city are the best judges of whether it needs bridges, railroads, and other public improvements, and how much it can afford to pay for them. But, practically, it has been found by experience that this local self-regulation does not work. Political corporations, like individuals and like private corporations, are subject to sudden waves of excitement when everything seems smiling and prosperous, profits certain, returns quick, and danger of collapse so remote that it may be disregarded. At these times cities and towns launch out into wild speculations, and as they can generally muster credit enough to get very long loans, everything goes on swimmingly until some period of panic or monetary distress comes, when they suddenly find themselves no longer in a condition to pay. Then a new loan has to be made to pay off the old one; and so the obligation clings like a millstone about the necks of the unfortunate taxpayers, who can just manage to pay the interest on it and no more. In theory, of course, there is no more danger of this in a city or town than there is in a well-managed banking or shipping house; but in practice the affairs of towns and cities are not managed as banks or other private business are. The results show that the rule of local *laissez-faire*, even with the addition of the "sinking-fund" principle, has not prevented extravagance whenever the taxpayers have been inclined to be extravagant. The "sinking-fund" has generally been adopted in the United States much in the same spirit in which it was first introduced in the days of Law and the South Sea Bubble—as a sort of talisman by which debts pay themselves. Almost every large corporation in the country has a sinking-fund, which is supposed to be rolling up while the debt remains stationary. Unfortunately, however, since sinking-funds are managed by the same men by whom debts are contracted, there is often a slip between the cup and lip; and the very same carelessness, negligence, and improvidence which make the debt increase make the sinking-fund decrease. A sinking-fund is, after all, only a pretty way of accumulating savings; if there are really no savings to accumulate, it will do no good.

The second way is that which the Connecticut reformers are attempting to introduce now. This has the advantage of settling the question once for all, by forbidding towns to contract debts in aid of private corporations in any case. The objection to it is that it takes away the power of selection as to what the taxpayers may desire to spend their money on. With regard to small towns and cities, which, in the nature of things, ought not to undertake responsibilities of an extensive kind, it may be best to lay down a hard and fast line of this sort; but with large cities, which necessarily have expectations of future growth and hopes of future greatness, the case is different. Cities of this sort are apt to think that they can judge a great deal better how to develop themselves—whether by taxes or by bonds, and whether by bonds in aid of railroads or by building railroads themselves—than any one else can

judge for them. Besides, the restriction does not in any way prevent their launching out in any kind of extravagance they please so long as it has no connection with a private corporation. Parks, boulevards, water-works, and bridges may all be brought under the head of strictly public expenditures, whether in a city of a million inhabitants or a town of ten thousand, and the debts incurred on their account may ruin either.

The third way of dealing with the question is by restricting the *amount* of municipal indebtedness which may be incurred. This plan has been adopted by the Massachusetts Legislature, and consists simply in fixing a percentage of the valuation which is to be the limit of the indebtedness. This does not necessarily restrict the objects to which money may be devoted, but it assigns a rational and easily understood limit—not an arbitrary limit either, but one which advances or recedes with the prosperity of the place. A town which is growing in population and resources is also growing, under this system, in its means of utilizing these resources, and a town which is stationary has no legal power to run into hopeless debt; while the creditor who advances money to it can see for himself the exact value of his security. By a law introduced into the Massachusetts Legislature, and we believe passed, the system was completed by giving the Supreme Court jurisdiction in any cases of violation of the new law, in suits which may be brought by any creditor or by any single taxpayer in any city or town. This puts the enforcement of the system into the hands of those who are directly interested.

A law of this sort may, if it is carried out, have an indirect effect of an unintended sort which would none the less be very beneficial. It has been for the last ten years the great aim of those interested in tax reform to get an equal, just, and uniform valuation of property in the States. With regard to personal property this has always been a failure, and in this State has been given up. But in the nature of things there is no reason why there should not be an equal valuation of real estate. Nevertheless, in the cities it has been found that assessors are apt to fix the value of estates as high as possible, while in the country they follow the opposite plan and make them as low as possible. Of course, the reason is that, in the country, estates are valued by assessors who are themselves generally landholders, and expect in this way to escape part of the general taxes. Although it is for everybody's interest to have a fair valuation, and any undervaluation is a direct injustice to every one throughout the State at large, still what is everybody's business is nobody's, and the thing goes on. But if a relation is established between local indebtedness and valuation, and the maintenance of this relation is put into the hands of the courts, and an action at law or in equity is given to every aggrieved person, there is certainly something like a chance that the system of valuation may be changed. It would manifestly be impossible to go on year after year getting judgments and decrees which were founded in error, and yet this would be the result if the limit of indebtedness fixed by law were calculated upon the false basis furnished by an undervaluation. It would clearly be for the interest of all creditors and taxpayers to have real valuations; and, besides this, in towns which wished to contract debts, as every town does now and then, there would be every motive to give up the agrarian system now in vogue. With a uniform and just system of valuation, there would seem to be some opening for the reforms in our system of taxation proposed by Mr. Wells and others, the first step in which must be a uniform valuation of real property, as its object is to make the burden of taxation fall upon the land.

Of course, in the long run, economy in public expenditure and among a democratic people cannot be expected in the absence of an economical spirit in the people themselves. But of there being at this time such a spirit there is plenty of evidence—in the press, in the numerous passage of constitutional amendments limiting the power of the States and other local bodies to borrow money, and the cessation of the system of grants of aid by legislatures and Congress. This spirit, however, is certain, before many years, to be succeeded by one of extravagance, as a revival of business causes a renewal of the general feeling of prosperity. It is important, therefore, that this economical interregnum should be utilized, as far as possible, by the introduction of constitutional and legal safeguards such as have always formed the great barriers for us against waste and misgovernment.

## TILTON AGAINST BEECHER.

THE Brooklyn trial has ended pretty much as most people expected it would end from the beginning, that is, in a disagreement of the jury. It can hardly be said that this is a victory for anybody, but it is something very like a defeat for Mr. Beecher. Not to get a vindication from the jury is, under such circumstances, somewhat of a failure. That Mr. Beecher looks on it himself in this light we infer from his Friday-evening talk pending the verdict, which was that of a defiant rather than of a grateful man. He let the world know that its opinion was not of much consequence to him, that if he did not get an acquittal he could do without it. The reflection which this must have suggested to many was that it was a great pity that this courage and self-reliance and indifference to human judgments had not been displayed at an earlier period in this wretched affair. Had they been, the country would have been spared twelve months of absorption in a most repulsive scandal, which has been rendered all the more demoralizing by the fact that nearly all the actors in it are persons who have made loud professions of living on a higher moral plane, or nearer to God, than the mass of their fellow-citizens. Part of the shock, therefore, which the public received when this trouble was laid bare, came from the discovery that the lessons of fortitude and indifference to mundane standards and aims of which Mr. Beecher has been a powerful preacher, and by which Plymouth Church has been built up, did not, as they ought to have done, prove useful on the very first occasion on which the church and its pastor were threatened with serious misfortune or annoyance. It was, as the result has proved, of vastly more importance to the great interests of religion and morality that Mr. Beecher should have met this charge in the spirit of his teaching, than that the church should have been saved from turmoil or disruption, or Mr. Beecher himself from temporary eclipse. His bold public denial on the stormy night when Moulton first brought the charge to his knowledge, would have had tenfold the weight that it had four years later, when he was dragged miserably, like a criminal, before the Brooklyn Court; and, more than this, it would have sounded somewhat like a trumpet-call to his disciples. As it is, he has managed to save the church, with the pews and other appurtenances, by the sacrifice of some of the great interests for which the church is supposed to have been instituted. He has not had to "step down and out," and the congregation has not been rent into parties, but there is now, if not to the uproarious crowds who attend his prayer-meetings, to reflecting men all over the country, something hollow and perfunctory in the advice he still proffers so freely on the conduct of life. He must not deceive himself on this point, and his enthusiastic partisans must not suppose that their ebullient devotion makes any serious impression on the sober second thought of the community.

But there is a certain sense, and that an important one, in which it may be said that neither the disagreement nor the agreement of the jury is of much consequence to Mr. Beecher. Of course, when men submit their differences to a legal tribunal, and debate before it for six long months, the technical victory of a verdict becomes inevitably an object of eager desire. The trial, if it has no higher interest, has the interest of a game which each side seeks to win, even if the stake is only a dollar. But then it was never expected by anybody—and probably least of all by the plaintiff and defendant—that the decision of the jury would decide the issue for the public at large. The popular desire for a legal investigation of the case was mainly due to the feeling that it was only by the use of legal machinery that the facts in it could be fairly and efficiently brought out. That they have been produced in great abundance there is no denying, but of the millions who have read them we doubt if there are ten whose judgment would have been much affected by the finding of the jurymen. *Their* verdict could not seriously or permanently have cleared or clouded Mr. Beecher's fame. Another tribunal, which was not visible in Brooklyn, which did not stamp or cheer during the evidence or the speeches, which needs no usher, and for access to which no tickets are necessary, before which there is no use in taking exceptions or excluding testimony, has been sitting on the case all along, and it is by its judgments that Mr. Beecher must stand or fall. Now, we have no hesitation in saying that it seems unlikely that to this tribunal his defence can have been satisfactory, and

for the simple reason that it has been, what a minister's defence ought never to be, very technical; not certainly as technical as it might have been, not more technical than might have been proper in the case of a man whose reputation was less delicate, but too technical for a man who needs to meet all charges as he would meet them at the last great day. One of the penalties or inconveniences of being a great moral or religious teacher is, that when charged with anything which seems likely to lessen his influence he can seek refuge behind neither forms nor statutes nor precedents. He cannot call on his accuser to convict him under the rules, and tell him that this or that proof will be heard, but none other. His only safety lies in asking every man who has aught against him to bring it forward and tell it every word, and then meeting it as best he can. This may be a cruel ordeal, full of snares and pitfalls and possible injustices, but exposure to it is one of the chief conditions on which a prophet or apostle or evangelist claims the popular attention and holds his place in the pulpit. If he have the tongues of angels and of men, and yet have sought safety from even the humblest accuser behind Starkie or Greenleaf, or the Court of Appeals, or the House of Lords, he must expect to have men shrug their shoulders when he shows the way to heaven.

Against this disadvantage Mr. Beecher has had several important advantages. He went into the fight not only with forty years of unblemished character at his back, but with the enormous support which popularity as a preacher gives to character. Great numbers of persons all over the country—we have ourselves received letters from several of them—have believed in his innocence all through, on the *à priori* ground that a man guilty of such an offence, and guilty of the falsehoods by which it must have been covered up, could not possibly have preached and prayed with the fervor and efficacy which he has all along displayed; and we think there are few people in the religious world who are not more or less influenced by this consideration, although the records of criminal jurisprudence contain abundant proof that fervor and efficacy might, under such circumstances, be matters of nervous force as well as of spiritual purity or elevation. He has been served powerfully, also, by the position and antecedents of his principal assailant, who had pretty completely destroyed his own character before he made his charges public, and whose queer, disorderly career furnished abundant materials for a sort of moral set-off on the trial. Moulton, too, had, like most intriguers, enveloped himself so completely in his own web that it was impossible for him to make his way out, with any show of integrity, when the moment came to turn on his protégé. The very office he had undertaken to fill for Mr. Beecher, which was, in its nature, one of falsehood and evasion, inasmuch as it involved the deception of the public even in a greater degree than the reconciliation of the parties, helped to discredit him when he appeared as a witness. Aid came to the defendant, too, from another and somewhat singular quarter. His letters would probably, in the case of any other man living, have been accepted as of themselves proving his guilt. Their language points, according to all the moral and social experience of this country and of England, to one particular offence and to no other. We believe there is no case on record where a man has used similar language about anything else. An attempt on the part of almost any other person in the community, therefore, to give it a different interpretation, or make it point to something of less gravity, would have excited derision. Yet Mr. Beecher has succeeded in satisfying a great many persons that what he meant by his fierce self-condemnation was the giving of legitimate and proper advice to a wife and to an employer about a man of vicious habits, who had been making his home a hell and using a widely-circulated newspaper to debauch the public mind. He has been able to accomplish this by reference to the general extravagance of his speech and behavior on all serious occasions, and yet his profession is not only that of a moralist, but that of a casuist. He has, that is to say, for forty years made it his business not only to lead people in the right way, but to train their sense of moral proportion. It is reported, too, that this explanation of his conduct had most weight with those who saw him on the witness-stand, for his demeanor there made plain the readiness with which he was swept by emotional storms and with which he might fall into any sort of rhetorical exaggeration.

To say, however, that the public is completely satisfied with this explanation would be to say something for which nobody has any warrant. With a great majority, we fear, it only creates at most a favorable presumption. It must be added, too, that there has been in the defence a certain want of ingenuousness, or frankness—if any one likes the term better—for which, though technically fair enough, people were not prepared in a case of this character. The number of things which, it would seem, ought to have left a burning certainty on Mr. Beecher's mind, and which he either failed to remember or failed to explain on his cross-examination, was unpleasantly large. His answers, perhaps, suggested no thing positive against him; but they did not make all the dark places clear. It was, too, we are sure, painful to many to hear a minister of Mr. Beecher's standing defended on such an occasion by some of the pleas which—though regular enough professionally—Mr. Evarts thought proper to bring forward on his behalf. What, for instance, could have been more irrelevant in the forum of morals than the glowing account of Mr. Beecher's services to the Union in England? Is it ingenuous for a minister even to suggest that an eloquent and patriotic man is, *as such*, unlikely to commit adultery? Would it not be trifling of the most grotesque kind, if a man accused you of improper relations with his wife, to ask him, by way of reply, whether he had read your great speech to the rebel sympathizers in Liverpool? We might, if we had space, pick out from the defence a large number of similar specimens of uncandid dealing with the jury and the public. They are a kind of thing which one hears in court every day, but it was impossible for Mr. Beecher to avail himself of them without injury.

Though last not least, Mr. Beecher's demeanor during the trial has not strengthened the prepossession in his favor. His jollity, people have not unnaturally argued, in the situation in which he has been placed, can hardly have been due to consciousness of innocence, or this consciousness would have stood him in better stead when the charge was first made, and have saved him from the tortuous experiences of his alliance with Moulton, and its attendant "anxiety, remorse, fear, and despair." It therefore has been difficult to avoid ascribing it to a want of moral sensitiveness, which has naturally and inevitably lessened the weight of his denials. That an excess of animal spirits should at certain crises injure a man in the estimation of right-minded people will probably be somewhat incredible to many of the noisy brethren of Plymouth Church, but they must make up their minds to accept the fact that their modes of expression are repulsive to a very large and respectable portion of the Christian world, whose opinions neither they nor their pastor can well afford to disregard.

The general result of the trial must, therefore, on the whole be regarded as unsatisfactory. Mr. Beecher has not been convicted, but then he has not been acquitted. Whether he is guilty or innocent of the main charge, the history of his relations with Tilton and Moulton, even as told by himself, is a pitiful story, which must remain a permanent blot on his reputation, and must considerably diminish if not destroy his influence as a moral teacher. But the case will furnish a lesson, more effective than any number of sermons, of the danger of bad company and of all undertakings which involve in even so slight a degree departures from truthfulness. "Men of the world," even, play games of concealment with considerable risk; a minister who engages in one stakes his life on the result. As soon as there arise in his career any facts the revelation of which he fears, and which have found their way into other hands than his own, there is but one course open to him, and any minister who finds that his religion has not prepared him for such a crisis may well doubt the propriety of his continuing to preach.

## PRINCE GORTCHAKOFF.

PARIS, June 18, 1875.

THE part which Russia has taken lately in the preservation of peace in Europe increases the importance which at all times should be attached to the diplomacy of the Court of St. Petersburg. This diplomacy is still conducted in what I might call the old fashion. As there are no Chambers in Russia, the Czar has the complete management of the national interests, and practically the diplomatic business is centred in Count Gortchakoff. After the great German Chancellor, there is probably now not a man in Europe who has a more absolute and complete responsibility in his hands. I spent a few days last summer at Interlaken between two excursions in the mountains, and I saw every morning the old Russian Chancellor take a constitutional walk under the magnificent nut-trees of the avenue. He was not much altered. He still stood erect, and there was on his lips the perpetual smile which is the characteristic of his expression. His eyes shone behind his spectacles with their usual fire. He was, as in old times, very affable, gay, courteous, fond of a neat joke. The Chancellor goes every year to some German watering-place—to Ems, to Baden-Baden—and spends a few weeks in Interlaken since his son Michael has become Russian Minister in Switzerland. The great notoriety of his name dates from the Crimean war. His brother, Prince Michael Gortchakoff, showed in the defence of Sevastopol the most stubborn courage. Another brother of his, Peter,

fought at the Alma and at Inkermann. The Gortchakoffs belong to the oldest nobility of Russia. Few people are versed in the mysteries of the famous book called the *Velvet* Book, which is the Russian peerage, but everybody knows that the Gortchakoffs belong to the first class of the nobility. They claim direct descent from Rurik, from St. Michael of Tchernigov and St. Vladimir. There are now only thirty-one families in Russia which can prove their descent from Rurik, and among them the Gortchakoffs hold the third rank in the line of descent. Their betters, in a genealogical point of view, are the Odoievskis and the Koltsoff Massalskis, quite unknown in Western Europe. After them come the Dolgorukis and the Gagarins. If you happen to speak on this subject with an old Russian you will soon learn that these families were far superior at one time to the Romanoffs, who were mere boyards. But the Romanoffs ascended the throne. The actual dynasty's real name is not even Romanoff—its name is Holstein-Gottorp. The institution of the *Tchin*—that is, the hierarchy founded upon public services and controlled by the Imperial will—has created an official aristocracy in Russia, but the people still have much reverence for their old princes, and a number in the *Tchin* is not the same in its eyes as a pure descent from the children of Rurik.

The present Chancellor, Prince Alexander, is the eldest of his family—he was born in 1800. Since 1862 he has been the Chancellor of the Foreign Affairs Department, the highest and most important dignity in the Empire. He alone belongs to the first class of the *Tchin*. The Russian people look upon him as the representative of Muscovite Russia ; his predecessor, Prince Nesselrode, came from a Westphalian family, and the Russians have a secret aversion to the Germans. Prince Gortchakoff took early an important part in what may be called the Russian renaissance ; he favored Russian literature, Russian art. He professes, however, a great liking for the French language, and prides himself very justly on the purity of his French. There is probably now in Europe not a single man, not even among the ablest *rédacteurs* of our own Foreign Office, who can write a despatch in French with the neatness, the elegance, and the perfection of Prince Gortchakoff.

The first post he occupied was Stuttgart ; he negotiated there the marriage of Princess Olga, the daughter of the Emperor Nicholas, with the Prince of Würtemberg, a marriage which greatly displeased King Wilhelm. He remained eight years in Würtemberg, as he had promised the Empress to stay with her daughter as long as she might need him. He was sent after 1848 to Frankfort, and there became intimately acquainted with Prince Bismarck. His real importance dates from the Crimean war. Count Nesselrode retired after the Treaty of Paris, and Prince Alexander received his succession. Let us try to remember what he represented at that moment, when he entered the Foreign Office as the adversary of Germany, and more particularly of Austria. Russia had expected the good offices of Austria when the Eastern difficulties began ; she considered herself betrayed by her ; she resented the conduct of Austria even more than the defeat which had been inflicted upon her by France and by England. Everybody looked upon Gortchakoff, a Russian of old descent, as the man chosen to renovate Russia, and to allow free play to the old Muscovite and national elements, which had been crushed by the German bureaucracy. Gortchakoff had played a great part as ambassador to Vienna in the Conference of the Great Powers in 1854 ; he understood early that France would soon direct her efforts against Austria, and he strongly advised Alexander II. to send an old Russian, Prince Orloff, to Paris to negotiate the peace with Napoleon III. He was already fifty-six years old, but he had quick perceptions, and he threw himself, at the very moment when his country had been defeated by France, into what I might call the French movement. He foresaw that the old treaties of 1813 would no longer be respected, and he chose for his ally the power which at that moment seemed the most likely to keep victory on its side. His attraction to France did not take the form of a positive alliance, but he gave Napoleon to understand that he would not find Russia in his way. Germany had abandoned Russia in her hour of trial ; Russia would now remain quiet, would make reforms at home. "La Russie se recueille" was the happy phrase in which he defined his policy. Austria felt the danger, but she could not avoid it. Russia folded her arms, and not only did she look with equanimity on the destruction of the Austrian rule in Italy, but she used her influence to hinder Germany from giving any help to Austria. In the East, Prince Gortchakoff adopted a policy of temporization; he remained strictly within the Treaty of Paris, believing that what the Czar Nicholas could not do by force would some time or other be done by necessity, and in consequence of the natural decay of the Ottoman Empire.

The passive attitude of Russia could not, however, last for ever. The insurrection of Poland forced Prince Gortchakoff to adopt a more decided tone in speaking to the Great Powers. The new dogma of nationalities, which had freed Italy, was adopted with enthusiasm by the Poles. Prince Gortchakoff was constantly reminded by France and by England that Russia had not fulfilled the agreement into which she had entered in 1815 with regard to Poland. But he would never condescend to treat the Polish question otherwise than as an imperial question. He wrote boldly to M. Drouyn de Lhuys, at the time when Napoleon III. was at the height of his power: "We believe that we anticipate the wishes of the Minister of Foreign Affairs of France if we abstain hereafter from continuing a discussion which would not fulfil the conciliatory views which we entertain." Napoleon did not press the question any further. Some time before, answering some observations made on the misfortunes of Poland, he wrote : "The evil from which the kingdom suffers is not an isolated fact. The whole of Europe is afflicted with it. The revolutionary passions, the scourge of our time, are just at present concentrated in Poland, because they look there for the focus of a conflagration which would soon extend over all Europe."

What was the secret of this change ? why did Russia challenge England and France ? why did she dare to say that she would allow nobody to interfere between her and her Polish subjects ? The secret is now well known. This was the time when Prince Bismarck approached Prince Gortchakoff and offered him a close alliance against Europe ; and why did Prince Bismarck make the offer? Because he wished to use the Russian alliance against Austria. Galicia had become the centre of the Polish agitation. Prussia knew very well that the partition of Poland had formed a permanent tie between Prussia and Russia ; and he only made the tie stronger, and promised to use the combined force of Russia and Northern Germany against Austria, who, though she had received her part of Poland, had never kept a very strong hold of her part of the spoils. This unfortunate Polish question has really been the centre and the nucleus of all the political combinations which have been developed since. This made Russia, so to speak, the accomplice of Prussia in whatever Russia should attempt ; and, by a strange change of fortune, Gortchakoff, who had risen to power as an anti-German, a Slavophile, became the instrument of the greatness of Germany. I have been acquainted with some of the men of Russia who were connected with the great movement which was falsely represented as a conspiracy at the beginning of the reign of Nicholas. These men belonged to the highest nobility of Russia ; they were all enamored of liberal ideas ; they dreamt of the emancipation of the serf, of a better administration of justice, of various social reforms, and also of constitutional institutions. They were the most quiet of citizens, though they were considered as the accomplices of a military conspiracy of which they were quite innocent. They were subjected to the hardest fate, but their dream is now accomplished, with the exception of those constitutional institutions which are still unknown to Russia. I only mention this in order to add that I have often talked of Poland to the men of that generation whom I have seen, and though they were good, humane men, I always perceived that the independence of Poland was not a part of their dream. To their mind, the independence of Poland means the subjection of Russia, and they were intensely Russian in their aspirations. The anti-Polish passion is a note which Prince Bismarck knows he can always touch at the proper time with the certainty that the cord will vibrate.

Late events have shown the two Chancellors in a new light ; it has become apparent that Prince Gortchakoff does not wish to become a mere tool in the hands of his friend and rival. He has played a very prominent part in the preservation of peace, and now at Ems he says to those who see him, "Il faut que la France soit grande et forte" (France ought to be great and strong). He is very fond of political maxims of this sort. They are, as it were, the medals on which he stamps his thoughts. Alas ! France is neither great nor strong at present, but she ought to be thankful to those who wish her well. It has also been lately one of Prince Gortchakoff's maxims to say : "La France est trop découragée" (France is too much discouraged). It is perhaps felt that France, even in the days of her greatest infatuation, was not a stern and hard master ; that she could be more easily dealt with than the new powers of the day. It is quite true that France is discouraged : we have not paid our ransom, we have only borrowed it ; it will take ten years of the country's net revenue to pay it back, as the net revenue of our agriculture is not more than five hundred millions a year. The time of personal slavery is past ; conquerors do not force the conquered to work for them individually, they force them to do so as a nation. Nations will become slaves if this new method of gigantic fines and ransoms, instituted by Prince Bismarck, becomes the rule of the coming times. We have indeed made a step towards a new kind of barbarism ; and the aphorism of Prince Gortchakoff is but a small consolation for our misery : "Il faut que la France soit grande et forte."

## THE SEMI-OFFICIAL PRESS IN GERMANY.

BERLIN, June 14, 1875.

LONG after the storm has ceased to blow, the ship continues to be rocked violently by the waves. If one looks upon the quantity of articles still published by the European press on the late war-rumors, one could almost believe a regular typhoon had been raging on the political seas. It is certain that these rumors have not been a "swindle," as Count Andrássy is reported to have called them, but it is as certain that they do not deserve the amount of ink still wasted on them. You have, with great clearness, pointed out what there is—I purposely do not write, has been—of real importance in them, viz., the uneasy state of the public mind in Europe, which is inclined to see in the smallest cloud a portentous forerunner of a tremendous storm. A great part of the press in Germany, as well as in the other European countries, has considerably aggravated the evil, and still continues to do so, partly from sensational tendencies, partly for want of other subjects to write upon. We are fast approaching the dead season of politics, and (though the legislative bodies are yet everywhere in session) are already to some extent in it, and, consequently, have begun to suffer under the curse of the press being obliged to fill so many columns every day. Swarms of *canards* are let up from every quarter, to be shot down the next morning by fearful volleys of *démentis*. One could fill a whole library with the interesting stories about what has been said, and what has not been said, in Berlin, in Paris, in London, and in all the other European capitals down to Darmstadt and Gotha. Yesterday we got a full report of the decisive two-hours' interview between the Emperor Alexander and Prince Bismarck in the latter's palace in the Wilhelmsstrasse. To-day we are informed that the Prince, at the risk of getting an asthmatic fit, hurried down stairs to meet his guest at the threshold. The whole conversation lasted about two minutes, and was within the hearing of the coachmen and footmen, in whose faithful bosoms the great secrets of state will be buried for ever. That most unfortunate being, "the future historian," will have some trouble in disentangling this Gordian knot prepared for him by merciless reporters. Thus far, the positive knowledge to be derived from the mass of contradictory revelations can be easily put into a nutshell, yet it is not valueless.

The *entente cordiale* between the three Emperors is as firm as ever, and the Emperor Alexander and Count Andrássy have formally testified to the fact that, to their knowledge and belief, there has never been any disposition in Berlin to trouble the peace of Europe England's valiant resolution to intervene in favor of peace has therefore, in a certain sense, been a blow in the air. There has from of old been a certain animosity against England in Germany, and public opinion chuckles with some satisfaction at seeing the kind offices of England politely declined, there being no need whatever for them. Yet those who are wont to make their political calculations with some soberness do not fail to recognize the truth of Lord Derby's assertion, that England's good-will may any moment become of the utmost importance. Not only by her money she may now, as she has done so often in former times, exercise a powerful influence, but, her own territory being protected by the sea, her army, though comparatively small, could be thrown into the scales as a great if not as the decisive weight. We therefore would heartily welcome a firmly uttered resolution on the part of England to use, with the utmost energy, all her influence against whosoever should attempt to disturb the peace of Europe ; for, as you do us the justice to believe, the great majority of our people are sincerely desirous to see it continued. Her late offer, therefore, to serve as mediator would not have awakened the recollections of our old supposed or real grievances against her but for one reason : we are far from being convinced that she is in earnest. Ere we shall be brought to believe that, she must prove her willingness to live up to her old and most solemn engagements. During the late apprehensions of war, every eye in Germany was turned towards Belgium ; for if France is ever again to attack us, it is from there we have to expect the first onset. England has guaranteed the neutrality of Belgium ; let her satisfy us and the rest of Europe that she is determined to back this guaranty with her money, her navy, and her army, and the reporters will have infinitely harder work to conjure up any war-clouds on the political horizon. As long as she fails to do this, her Cabinet ministers may pinch the tail of the British lion as vigorously as they like to make him roar, no one in Europe will mistake his angry grunting for the roar of bygone times, which used to shake the nerves as much as the crowing of the Gallic cock. Until she makes up her mind to this, she cannot leave her position of a second-rate power, which she has voluntarily assumed. We won't be paid any longer with words we want to see deeds. I do not know whether you and your readers will endorse this opinion, but, whether it be well founded or not, it is the all but universal opinion of Germany, and as such it deserves to be mentioned.

Happily, France—whose desire for revenge England would be principally called upon to keep in check—is not in a condition to attempt anything without allies. One therefore quite frequently hears experienced diplomatists express the opinion that it is not the Western but the Eastern horizon which should be the most carefully watched, since it is from that quarter that the *entente cordiale* between the three Emperors is the most likely to be disturbed. If this opinion be well founded, the friends of peace should be gratified by it, because there is certainly at present neither in Russia nor in Austria any desire to make the Eastern Question the order of the day, and we have every reason to say with Sumner, in his celebrated speech on the Johnson Treaty : "If there necessarily must be a war sooner or later, for God's sake let it be later," though we, unfortunately, cannot conclude with him—"and I am sure it will never be."

In the inky war which is about to be terminated, if not by a peace, at least by a truce, the worst defeat has been suffered by the reporters, for it is most positively and without contradiction asserted that Bismarck has ordered "the press bureau" of the Foreign Office to be dissolved. What this exactly means it is not easy to say, for a "press bureau" has never existed in the Foreign Office, and Mr. Aegidi, who has been the only speaking-trumpet through which the Chancellor has sent his hints to the press, is retained in his old office. Bismarck is undoubtedly very far from having entirely and for ever renounced this means of communicating the views of the Government to the public, and thereby of forming public opinion ; no government on this continent ever will or can do this. Yet a new régime in this respect is certainly about to commence. Henceforth there will be no reason for believing every sentence in the semi-official papers, or even in those which are reputed to enjoy the good graces of the Government, to be "inspired" by the highest authorities. It was high time to put a stop to this. Though the secret funds for press purposes have been principally employed in foreign countries, and though the Ultramontanes have done their best to paint in black of the deepest dye what in reality was only gray, still the Government has sinned even with regard to our own press more than enough to alarm seriously every true patriot. Public confidence in the press began to be shaken, because everybody knew that the "reptile fund" was a dire reality, and because none could tell with certainty what papers fattened on it. Wherever the Government was supported by a paper, its enemies raised the cry of the "reptile fund," and no denial could be wholly effective, because there were no means of distinguishing the innocent from the guilty. So this business at last turned out to be of a kind to make every party a heavy loser. The public began to ask whether they had any longer an organ in the press ; the independent press demurred, because they could not prove their independence, and were at every moment exposed to calumnious attacks ; the Government felt a decrease in the support it had derived from public opinion, because it had become impossible to tell how much of this public opinion was genuine, and how much of it had been fabricated. Finally, even the very purpose which the "reptile fund" was to serve was frustrated by the excess with which it had been used. As the public had been led to see "inspired" articles everywhere, a horde of second and third rate reporters learned quickly enough to set up on their own hook manufactories of inspired revelations. The article remained in demand, and so much had been furnished of the genuine one that the professional man did not find it difficult to fabricate his counterfeits with sufficient skill to palm them off as genuine on many a dupe. Only an opportunity was required to bring a perfect flood of them down upon us, and this opportunity was offered by the war-rumor. Our semi-official press has been wrongly accused of having pushed the excitement to a dangerous height by its indiscreet zeal. Bismarck and Mr. Aegidi are clever enough not to say more than they want to say, and they know how to select the people they want to employ. The trouble was that the semi-official press had become such a wide and vague thing that nobody, not even the best initiated member of the profession, could tell where it commenced and where it ended. To this circumstance we owe it that Bismarck has come to see what a double-edged weapon the "reptile fund" is, and if he sticks to his resolution we have every reason to congratulate ourselves on the late war-rumors. However much it may have cost us that the excitement was raised fifty or even ninety per per cent. higher than it need have been, we shall have made a good bargain if we have bought with it the certainty that a stop will be put to the systematic poisoning of the press. Whether the promise will be kept, only time can reveal. We must take care not to judge this question prematurely, for we already have swallowed too much of the poison not to feel the effects of it for a long time to come. Reporters and a certain class of politicians

will be slow to give up the practice of bestowing inspired revelations on the public, and members of all parties will continue to be engaged in the unclean business. The Ultramontanes have been the first to prove that they are unwilling to give it up. Before the Convent Law (the latest blow in the war against Rome) was introduced by the Cabinet in both houses of the Landtag, they asserted with great assurance that the Emperor had refused to give his consent to it. And now they set afloat the story that the Emperor had declared to Dr. Falk that no other law against Rome and the Ultramontanes would be approved by him. It is hard to tell what they expect to gain by these manœuvres, for the Convent Law was signed by the Emperor, and Dr. Falk at once pronounced the latter story an absurd invention.

# Correspondence.

## BOATING ETHICS.

To the Editor of The Nation:

Sir: The *Evening Post* has an article entitled "A Word to College Oarsmen." The article contains much good advice, and sets forth with strength the importance of honorable conduct, command of temper, courtesy, and decent manners, and the scandal of the reverse, under whatever excitement. All this is well; but, after an observation of many years, I am satisfied that there is more need of a word to editors than of a word from them to college oarsmen. I am not a boating man, for boating came in after my day; but I have watched the regatta system with deep interest, not that I care to know which of a dozen boats came in a few feet ahead in the vicissitudes of a three-mile course, but to observe the effect of regattas upon the physical and intellectual condition of the rowing youth, and especially on their morale.

Amid the excitements of Springfield or Saratoga, the few quiet spots are the quarters of the crews. They live there under strict rule as to hours, diet, exercise, and sleep, careful above all to avoid excitement, and to exclude all its causes. They do not (I speak of the best, but I think it is true of all) read the newspaper reports and letters, and they have as little as possible to do with the correspondents, reporters, and interviewers of the press. If a reporter applies, tape in hand, to measure their arms and chests, they refuse to be treated as prize oxen; and if he tries to draw from them how they feel about this or that crew, they give him no light, and discourage a prolongation of his attentions, at the risk of "our correspondent's" being down upon them as "aristocratic." They are not to be seen at the hotels, betting-places, or gatherings of gossipers. Let any fair judge seek an opportunity, and he will see that they show the least excitement of all who are at the races. It is the crowd of betting men, of reporters and correspondents, and of light-minded boys and girls, and graduate children of older growth, who create and minister to the intensity of excitement, and spread over the land exaggerated partisan accounts or sensational descriptions, and, worse than all, mean insinuations of dishonest, unworthy conduct, feared or intended. When letters from the agents of our leading papers contain such passages as these: "It is currently reported that Yale, hopeless of winning, intends to foul Harvard, and Harvard has been put on her guard"; "it is understood that Harvard, seeing her defeat inevitable, is negotiating to sell out her race to Princeton, to spite Yale"; "Williams has a double watch over her boat at night, having been warned of sinister designs by Dartmouth"—I do not quote *verbatim*, but in substance—do not editors need a little caution? The truth is, as these are not intellectual occasions, editors are too apt to think that it is not worth while to send a first-class man, if the man they send is only busy in picking up items and can describe vividly, and do not trouble themselves to learn whether the applicant they employ is a pledged partisan or what is his moral habit or structure. Consequently the press, and even the best papers, spread before the reading public an amount of unworthy gossip before the race, and of heated, partial, ill-considered, and untrustworthy imputation and scandal after the result, against umpires as well as crews, with exaggerated commendations of favorites, with the worst effect upon public feeling and opinion. This goes abroad, and Europeans say, "If these are not true pictures of what American colleges are, they at least show what their countrymen think of them"; and they have a right to say so.

This is unjust as well as unworthy—no occasion has been given for it. College races and ball matches have gone on for twenty years, amid excited crowds, and yet there has been no instance of a personal collision, and but one instance of offensive language, and that was confined to a single crew, and to a few in that crew, under high excitement; and the affair has since been settled and adjusted, as I learn, in a satisfactory manner. There are frequent exchanges of favors and courtesies between crews. It is here, as it was in our civil war, not the combatants who are the most violent and irreconcilable, but the women, the editors, and the spectators and friends of the combatants.

Editors should remember that they are dealing with sensitive men—men who are taught to be sensitive as to everything touching their honor or reputation. If they have not learned to feel an imputation as a wound, what is their education worth? They must not be treated like hackneyed Ring politicians or case-hardened jockeys. Yet they have been treated in that way by the press so largely as to wound their feelings deeply and make them dread the reports and letters in the papers, written by men who are often their moral, intellectual, and social inferiors, more than any possible accident or result of a race. A leading journal of an adjoining State more than once made onslaughts on a college crew—the rival of the crew it favored—which its sturdy, kind, brave, and patriotic editor would not have allowed against an adverse caucus manager or Ring politician. He doubtless knew nothing about it. It was "only boating"; and he probably left it to some one whose partisanship was too intense or whose notions were too low.

My "word to editors," on behalf of collegians and their parents and kindred, and of all interested in their truest nobleness, is that they shall take great care in selecting their correspondents and reporters, excluding strong partisans and men of low tone, and then keep an oversight over what they print. If the press does not improve over 1873 and 1874, the best collegians will not expose themselves to its criticisms.

A word to presidents and officers of colleges. They have been in fault—a few of them; there are conspicuous exceptions. They ought not to add fuel to the flame of excitement. If college presidents and teachers identify the boat with the college officially, go out to meet the returning victors, head their procession amid public cheers, put their flags and oars in solemn official keeping, and turn their heads with flattery, and lead them to believe that they have done more for their college than its scholars, moralists, statesmen, and founders, what degree of self-control can they expect of their pupils? The extract from President Porter's address on opening a new boat-house at Yale is very good, and may be well laid to heart, but, with the most entire respect for him, I must say that it will hardly balance the effect of his officially receiving the Yale crew returning from Springfield, and not limiting himself to eulogy of the crew he received. The official course of the president and some of the officers of Columbia, last year, has perhaps been sufficiently censured, and I do not believe that the grave and venerable alumni of another college, which need not be named, will so lose their heads as to give a banquet in a city, with fulsome eulogies, to the winners of one race.

Nothing of this sort takes place in English colleges, nor at Harvard. I trust that whoever wins next week, no college faculty will chant Te Deums or put on sackcloth.

A word to the "fair cousins" and the "fellows" of our college, or club, or year would, I suppose, be wasted. Their *brevis furor*, their reckless gossip, are after their kind—"it is their nature to," as says Dr. Watts. But, surely they may take in the idea that there is, or ought to be, such a character as the American gentleman. In England, the ideal of an "English gentleman" is high. All feel it, or at least affect to. English girls or young men, whether their colors be Oxford or Cambridge, Eton or Harrow, would resent an imputation upon the honor of the other crew as a national insult to the best the kingdom has to show. Have we no such ideal? Have our young ladies and young gentlemen no such feeling about our collegiate youth, as a class, whether they be of Harvard, Yale, Princeton, Columbia, or Amherst, and whatever colors they themselves may wear?

If editors will take care how their columns gossip, impute, and slander, and see that their writers treat the collegian rowers as gentlemen of honor; and if the college officials will keep their heads cool, and take no official notice of the results, unless to correct or censure privately those in their charge, and will try to see that their crew accept the decision of the umpire, and that justice, or at least fair treatment, is given to rival crews in the college journals; and if the young men and young women who attend the races and wear their colors will remember that the character and fame of the educated American gentleman, of whatever college, should be a national treasure, and that the tongues of giddy girls and light-headed young men may create wounds as poisoned arrows, and bring the class of collegians into disrepute—if something may be done in these directions, it is my belief that the young gentlemen who pull the boats may be pretty safely left to themselves.

Middle-aged Alumnus.

# Notes.

J. B. LIPPINCOTT & CO. have in press 'Prose Quotations from Socrates to Macaulay,' with indexes, by S. Austin Allibone; and the following reprints from English works: 'The Celt, the Roman, and the Saxon,' by Thomas Wright; 'Log-book of a Fisherman and Zoölogist,' by Frank Buckland; and 'Notes on Building Construction.'——D. Appleton & Co. have reprinted, in one volume, the latest edition of Darwin's 'Descent of Man.' The print is rather close, but the convenience of having one volume instead of two is considerable.——A new genealogical magazine, which will concern itself with unpublished pedigrees, wills, grants of arms, monumental inscriptions, extracts from parish registers, etc., is announced in England, to be called the *Genealogist*, and to be issued quarterly in parts of not less than 48 pp. 8vo. The editor is Dr. Geo. W. Marshall, the well-known Secretary of the Harleian Society, and editor of two of their best books. He may be addressed care of Messrs. Mitchell & Hughes, 24 Wardour Street, London, W.——Whatever improvements one could wish in the administration of the Astor Library, there is no denying its great public usefulness; the increased attendance in its reading-rooms has been very noticeable of late years. The Twenty-sixth Annual Report of the trustees shows an addition of 2,666 books, of which 1,938 were by donation—upwards of 700 volumes coming from the Astor family alone. The total number of volumes is now 150,306, and 127,579 were delivered to readers, who in 1874 numbered 34,854, against 29,438 in 1875. Twenty-five years ago there were only 20,000 volumes in the library, Fifteen years ago, only 59,516 volumes were consulted. More than two-sevenths of the alcove readers frequented the department of patents. The endowment of the library is now $775,336, against the $400,000 of John Jacob Astor's will.——The Fifth Annual Report of the trustees of the Metropolitan Art Museum tells of increased public attendance, especially on the free days, of a respectable addition by gift to the collections, and of proffered loans of art-objects beyond the Museum's capacity to receive and exhibit. The experiment of evening admissions proved a failure. Hereafter there will be two free days. The plan of annual membership has been found a valuable source of revenue and support, and the present total, 531, might certainly be doubled without exhausting the ranks of art-lovers in this city.——We have already announced the holding of the twenty-fourth meeting of the American Association for the Advancement of Science at Detroit, August 11. An important feature of it promises to be the organization of permanent sub-sections in all the branches, as has already taken place in Chemistry. Members intending to be present should notify Mr. Frederick Woolfenden, secretary of the local committee at Detroit.——In No. 521 of the *Nation* we erroneously called the Chancellor of the Diocese of Lincoln—who decided against the Wesleyan minister's right to the title of Reverend—"the Bishop's son." The Bishop is, of course, Bishop Wordsworth, and the Chancellor Mr. Walter Phillimore.

—This time it is peas which have been "found in a sarcophagus containing a mummy, in the course of certain excavations going on in Egypt." If the *Popular Science Monthly* does not mean to vouch for the story, it would have been better to introduce it with the saving distich,

> "I cannot say how true it be;
> I tell the tale as 't was told to me."

Instead of that, it adds, by way of corroboration, "the fact so well known to the farmers of Monmouth Co., New Jersey, that the greensand marl, sown upon land almost sterile, brings in white clover where it was not known before"—the implication being that the clover-seeds are survivals of the tertiary period. Popular science should dispel rather than propagate popular illusions (not that we doubt the coming in of the clover, but only that its seeds came with the marl), or at least cite authority for shaky statements, as is wisely done in a succeeding page: "The writer in the *Garden* asserts that Paris has now so large a number of parks, and its streets and boulevards are so profusely planted with trees, that the death-rate has been *thereby* reduced from one in thirty-four, as it formerly was, to one in thirty-nine, as it now is," through the action of these trees in decomposing carbonic acid. *Post hoc, ergo propter hoc* is popular but not exact science.

—The one creditable periodical in the English language, not the organ of any society, devoted to geography, is the *Geographical Magazine* (London: Trübner; New York: John Wiley & Son); but it is a source which appears to be wholly ignored by our editors who look abroad for select reading-matter with which to make their weekly or Sunday editions attractive. There is not an issue of it, however, from which something interesting and instructive might not be quoted. Of this we are forcibly reminded by the June number, which opens with an article on the late Captain Sherard Osborn that would well repay reprinting either entire or judiciously abridged. We should like to have the average Congressman read it, because it might soften his heart towards that navy whose uselessness he is so prompt to perceive when war is over, and whose inefficiency he is so prompt to denounce on the unexpected looming up of war. We should be glad also to have every officer in the navy, and every cadet in the Naval Academy, read the life of a fighting commander whose aim was, nevertheless, "to find noble and worthy employment for our [British] naval officers and seamen in time of peace," maintaining (and setting the example in his own person) that "they should take a lead in great enterprises for the benefit of commerce, in surveying, and above all in daring achievements connected with geographical exploration and discovery." Of this spirit there is, of course, no lack in our navy, nor is the capacity wanting: the surveys of the Isthmus and the soundings in the Northern Pacific will occur to every one as instances of recent most honorable activity. We only mean that there cannot be too much of that spirit, and that the training of officers should foster it as much as it fosters pride in our naval victories, and that a career like Osborn's should be held up as an example which adorns not alone the British navy, but the profession in all civilized countries. Moreover, on one occasion, his discretion and personal sacrifice at a critical moment in his own affairs and in our national distress during the civil war, should cause him to be long and gratefully remembered by Americans. Having been engaged by the Chinese Government to assist it in creating a navy to put down piracy, at his own risk he collected in England a squadron of vessels of the right sort, and took them to China, only to be denied what had been promised him—direct communication with the Emperor and his Prime Minister. Declining to be the servant or the tool of any mandarin, he withdrew his fleet, which, as it had not been delivered, was not paid for, and was a formidable burden on his hands. The rebellion had just broken out, and the Confederate agents in China pressed him to sell them his vessels, one of which was reputed to be one of the swiftest steamers afloat, and was armed besides with a Whitworth gun. As Sir Bartle Frere tells the story:

> "Large sums were offered Osborn either to transfer the squadron himself or to wink at its transfer by the Chinese. . . . The temptation was a great one to a very poor man, saddled with the cost of the whole squadron, and quite uncertain whether he could get rid of his responsibilities without utter ruin. But he was proof against the temptation, though put to him in a form which, to a man of less sensitive honor, might have seemed free from objection, and he sailed . . . to India. . . . At Bombay the offers of the American belligerents were repeated with such persistence that Osborn felt it would be unsafe to follow out his plan, which was to leave his vessels at Bombay and go to England himself to arrange for their disposal. The risk of the sale of the vessels to private parties leading to a serious breach of neutrality was made so clear to us, that we strongly recommended to the Government of India the purchase of the squadron, and Osborn thus by his foresight and noble disinterestedness prevented a second and more serious edition of the *Alabama* claims."

—Shakspere, without naming him, introduces in his play of Henry IV. the Lord Chief-Justice of the King's Bench as "the nobleman that committed the Prince [Henry V.] for striking him about Bardolph," and, later in the same play, represents the new king as forgiving the judge for the courageous performance of his duty. This judge was anonymous in the earliest account of his action, viz., in 'The Governor' of Sir Thomas Elyot, a work dedicated to Henry VIII. and published in 1544; but as the King's Bench was the court mentioned both by Elyot and by Hall in his 'Chronicles' (1548), subsequent writers, following these authorities, came to give the credit to Sir W. Gascoigne, who was its chief-justice from 1400 to 1413. In a late number of the *Academy*, Mr. Clements R. Markham, after reciting these facts, goes on to say that if there is any reason for believing a story told at least 140 years after the date of its alleged occurrence, there is less ground for regarding Gascoigne as the hero than his own ancestor, Sir John Markham, a puisne judge of Common Pleas from 1396 to 1409. In the first place, Sir Richard Baker states, in his 'Chronicle' (1641), that the prison to which Prince Henry was committed was the Fleet, in which case the outrage must have been on a judge of the Common Pleas. And secondly, in the two families of Cotham and Sedgebrook, founded by the two sons of the judge in question, "there were traditions, in the reign of Queen Elizabeth, that Sir John Markham committed Prince Henry to the Fleet for contempt of court." Two MS. attestations of this tradition exist: one, a book written in 1601, but never published, by Francis Markham, of the Cotham family; the other, a diary of Sir Robert Markham, of Sedgebrook. The latter document is in the British Museum; the former, in the possession of the writer of the letter in the *Academy*. But of neither Gascoigne nor Markham can it be true that Henry V. forgave him on his coronation; for Gascoigne he

dismissed March 29, 1413, eight days after his accession, and before his coronation, while Sir John Markham died in 1409.

—Many young artists will grieve over the termination, by his death, of M. Barye's admirable lectures, in the *Jardin des Plantes*, on comparative art-anatomy. Delivered with the authority of his almost octogenarian age, these discourses, prepared with very exceptional knowledge of animal structure, with unsparing thoroughness and constant illustration from living nature, were quite unique for the solid and minute aid they imparted. The special advantage of M. Barye's courses of lectures lay, necessarily, in the fact that they were delivered in the midst of a rich zoölogical garden, where the animals pacing the cages all around were the Professor's books. Besides his demonstrations from these living authorities, the knowledge of whose anatomy had been the labor of his life, and the study of whose movements had endowed him with a mass of facts quite apart from mere anatomical science, his teachings were illustrated from the museum of preserved specimens so abundantly laid up since the days of Cuvier and Buffon, and so completely digested in his mind. M. Barye engaged in the demonstration of these collections in 1859 ; since 1850 he had been employed in teaching, at Versailles, the art of designing subjects in natural history. The career of this aged sculptor, medallist, aquarelliste, oil-painter, and metal-founder is typical of his country, showing how skilled talent, by a course of terribly hard work, is improved into something like genius and emerges from industrial art into fine art. Born in 1795, and educated with the die-sinker Fourier, the sculptor Bosio, and the painter Gros, the recipient besides of the second grand prize of 1819 for his statue of Cain, his thirtieth year saw him a workman rather than an artist, and a disappointed contestant for the contract of making the coinage of Charles X. He was several years in finding his niche, and exhibited publicly busts, statues, painted portraits, and cases of medals successively. His earlier works were quite different from those on which his reputation now rests. In 1831, he made a St. Clotilda for the Madeleine, and a St. Sebastian ; in 1833, a bust of the Duc d'Orléans. His animal subjects began to attract connoisseurs when he was about thirty-five years of age. The Duc de Luynes bought his "Panther and Gazelle," the Duc de Nemours his "Asiatic Elephant," and he made to the order of the Duc d'Orléans a superb table, decorated with nine hunting scenes. His "Lion and Boa" was placed in the Tuileries garden, and popularized his fame. Government patronage began with his superintendence of the plaster casts made from the Louvre collection in 1848, and culminated with the Second Empire, when he assisted largely in decorating the new pavilion of the palace. Simultaneously with his official occupation, he utilized his thorough and historical knowledge of old styles of metal-founding by multiplying copies of his works in *cire-perdue*, opening an atelier, and dispensing copies of his statuettes to the parlors of the whole civilized world. His tigers and jaguars, his reduction of the "Lion of the July Column," his various beasts of prey pursuing their instincts with all the energetic grace of nature, are known to everybody. It is stated that a nearly complete collection of them is to be found in the Corcoran art gallery at Washington. The key to an understanding of his art is his confining himself to the expression of anatomy and movement, rejecting as a hindrance the veil of mere texture which is formed by the hide of an animal. M. Barye died on the 28th ultimo. He was born at Paris, September 24, 1795.

—We have in our hand a copy of No. 2 of the *Antikritiker* (see the *Nation*, No. 515). Though it calls itself an "organ" of literary vindication (*Vertheidigung*), its dress is suggestive rather of bushwhacking than of anything more disciplined and coherent ; and its motto of passive resistance—"Right is Truth, and Truth is Right"—pales before the bolder lettering of the head-line, apparently drawn with a marking-brush by a hand not averse to daubing with black. "If," says the editor to a correspondent, "the Right were always the Truth in critical periodicals, we should have no need in the *Antikritiker* to help the Truth to its Rights." To another he says that principled hostility to criticism is by no means the attitude of his publication, which he soberly believes merits the good wishes of critical journals, since it promises to relieve them hereafter of expectations that they will print corrections or rejoinders. To a third correspondent, who had thrown up to him Jean Paul's maxim that "critics ought never to be answered" (*Auf Kritiken muss man niemals antworten*), he replies that this, like so many of the sayings of great men, must be taken with a grain of salt. He announces that contributors to the *Antikritiker* will be allowed to preserve their full individuality in the matter of orthography—a license which it would certainly be rash to encourage under similar circumstances in this country. As the "organ" appears in unlimited numbers (*in zwanglosen Nummern*), he recommends his subscribers to pay for six numbers at a time ; and this, which is perhaps as long a term as the most sanguine victim of the reviewers would concede to the *Antikritiker's* existence, is doubtless the limit of safe investment at 1 Mark 70 Pf., postage included. The price of vindication, on the other hand, is 4 Marks a page, so that No. 2 brought in 80 Marks to Herr Nehring over and above what his subscribers paid him and his charges for extra copies to the two contributors who occupy the number. One of these defends against adverse judgments his Nepos, and makes the plaintive confession in a foot-note that "the following *Antikritik* was composed a year and a half ago, but could find no organ that would publish it." At the close of his article he gives the whole of a favorable review of his text-book. The second contributor, Dr. Dorr, starts with an ominous title—"Noch ein Wort" ; and, in fact, he informs the reader that a certain work of his (in physical geography) was published in 1873, and was criticised by Kirchoff in May, 1874 ; Dorr's rejoinder followed immediately ; in October Kirchoff returned the compliment, and without delay was answered again. Acting on the French proverb that a door must either be open or shut, Kirchoff made a third effort to silence his antagonist, in December, and here we have, in April, 1875, "another" but not perhaps the last "word" from Dr. Dorr. One might infer that this debate had been carried on in a literary journal till the bore became so great that the editor was obliged to interpose with—"No more letters will be published on this subject." It appears, however, that while Kirchoff had the benefit of the *Jenaer Literaturzeitung*, Dr. Dorr's replies were in pamphlets printed at his own expense.

—The approaching Michael Angelo festival has renewed the interest always taken in this great man by his fellow-countrymen, and led to the discovery of some interesting facts concerning him. The examination of the Roman criminal archives revealed the existence of the official inventory made by order of the Governor of the city immediately after Michael Angelo's death. In this document are mentioned not merely the furniture, clothing, money, and horse belonging to him, but various unfinished statues and several cartoons. Some information is also given concerning his illness, domestic arrangements, etc. Another interesting circumstance is the discovery, or rather deciphering, of a heretofore unpublished sonnet by Michael Angelo. It is written on the back of an original design by the artist which forms part of the collection made by Sir Thomas Lawrence, and purchased by the University of Oxford. The drawing represents a study of horses and sketch of a battle, and on the back are five sonnets and madrigals, four of which are printed in the last edition of Michael Angelo's poems (Le Monnier, Florence, 1863) ; the fifth, a sonnet, has heretofore baffled all attempts to decipher it. In the June number of the *Rivista Europea*, A. de Tivoli, professor of Italian in the University of Oxford, has solved the problem, and given an intelligible reading of the poem and an interesting copy in the original spelling, with the author's corrections, etc. The sonnet is erotic in its character, and by no means among its author's best, and was probably suppressed by him on that account, just as when a statue did not correspond to the ideal he wished to represent he broke it in pieces with his hammer. Those who would know the care with which Michael Angelo polished his poems (resembling, in this respect, his predecessor Petrarch), and the great difficulty of reconstructing and editing them, will find an interesting article on the subject, by Karl Witte, in the first number of the *Romanische Studien* (Halle, 1871).

## SOME RECENT WORKS ON MUSIC.*

THE four little books which we have grouped together below have no further resemblance to each other than is implied in their all treating of music. They treat in very different ways four different parts of a very wide and complex subject. Mr. Sedley Taylor's 'Science of Music' deals entirely with the acoustical principles which underlie the sensations of harmony in its various phases of consonance and dissonance. It is, in the main, an exposition of the physical side of Helmholtz's speculations and discoveries contained in his 'Lehre von den Tonempfindungen,' a work of which Mr. Taylor justly says that it has done for acoustics what Newton's 'Principia' did for astronomy. But while it is thus not in the highest sense original, Mr. Taylor's work is far from being a mere epitome of Helmholtz's theory. There are some expositions which deserve to be ranked among original works, because they are the product of independent investigation, and because their method is such as to throw new light upon the subject expounded.

* 'The Science of Music ; or, The Physical Basis of Musical Harmony. By Sedley Taylor, M.A.' New York : D. Appleton & Co. 1875. 12mo, pp. 169.
'What is Music? By Isaac L. Rice.' New York : D. Appleton & Co. 1875. 12mo, pp. 94.
† Piano and Song : How to Teach, how to Learn, and how to Form a Judgment of Musical Performances. Translated from the German of Friedrich Wieck. By Mary P. Nichols.' Boston : Lockwood, Brooks & Co. 1875. 12mo, pp. 189.
'Praktische Harmonielehre in 54 Aufgaben, etc., von Ludwig Bussler.' Berlin. New York : L. W. Schmidt. 1875. 12mo, pp. 208.

Mr. Taylor's belongs to this good class. It may be read with pleasure by those who are familiar with the great German work, and to the majority of readers who feel incapable of grappling with the latter it will give a very lucid and thorough account of the acoustical facts upon which modern harmony rests. The most essential feature of the new theory is the discovery that our seemingly simple sensations of musical tone are in reality highly compounded. When C-string is struck on the piano we really hear something more than C, and for a simple physical reason. It is well known that a vibrating string does not merely vibrate as a whole, but that its half-length, quarter-length, etc., also simultaneously vibrate as minor wholes. The bass C-string not only gives out bass C by the vibration of its whole length, but the vibration of its half-length simultaneously gives out middle C, and in similar wise there come out the upper tones G, C, E, G, B♭, D, etc. With sufficient practice these can be discriminated by the ear, but on different instruments, such as the piano, violin, and flute, they come out with different relative intensities. Some instruments are richer than others in overtones, and in some the lower overtones, while in others the higher ones, come out with greater distinctness ; and to these differences in the intensities and grouping of overtones the differences of timbre in various instruments are wholly due. The piano, violin, and voice are rich in overtones, while in the flute there are but few, and the thin and colorless quality of some of the stopped pipes of an organ is owing to the almost entire absence of overtones. The C or G of a piano, therefore, which we formerly regarded as a simple tone, is really a composite *clang;* and every clang is a kind of chord in which the fundamental tone is relatively powerful enough to obscure but not to extinguish its companions. From this discovery flow very important theoretic consequences. In the first place, it appears that harmony and timbre are at bottom so closely related as to be nearly identical, so that, for example, our enjoyment of a rich concord has the same physical justification as our preference for the clang of the violin over that of the flute. But, secondly, this view comes in to modify our whole theory of harmonic combination, and gives us for the first time a scientific interpretation of the rudiments of musical pleasure.

At first, the theory of harmony seems to be extremely complicated by the consideration that every chord is a combination of composite clangs, instead of simple tones. For, obviously, when three notes are struck together, as in the tonic triad of C major, it is not simply necessary that C, E, and G should be in concord, but it is also required that the overtones of the three notes should not be dissonant with each other. But in this requirement Helmholtz, with keen insight, finds a simple and beautiful explanation of the causes which regulate consonance and dissonance. When two or more series of waves of very different lengths enter the ear at the same time, they behave like a single series of compound waves, and there is no interference. But when two series of waves, very nearly equal in length, are received by the ear, a phenomenon occurs quite analogous to what is known as the interference of light. The one series of waves tends now to reinforce, now to diminish, the nervous effect wrought by the other series. There are successive rhythms of greater and less intensity of tone, and this effect is commonly known as "beating." In some cases—usually where the pulsations are very slow—this effect is not unpleasant to the ear, but in the great majority of cases it is intolerable, in much the same way that the flickering of light is intolerable to the eye. The jarring sensation is familiar to every one who has heard a piano out of tune, or two church-bells struck together of nearly the same pitch. It is by the disappearance of this "beating" that the tuner of a musical instrument is guided in his work.

Bearing this in mind, let us observe how all musical dissonance is explained by the discovery of overtones. When A and A♯, being struck together, make a horrible dissonance, it is because they are "within beating distance" of each other ; but a hardly less powerful dissonance arises when A and G♯, at an interval of a seventh, are sounded simultaneously. This is obviously because the first overtone, or octave of A, is within beating distance of G♯, and in this simple instance we have the type of all musical dissonance. Perfect concords are those in which none of the overtones come within beating distance of one another, or of any of the fundamental tones. From this extreme, attainable only in the case of the octave, there is an infinitely subtle gradation of jarring effects, increasing with the number and prominence of the beats, until we reach decided discord. The root of the whole matter, therefore, is that consonance is due to continuous, dissonance to intermittent, stimulation of the auditory nerve-fibres. To go further would be impracticable in the space here at our command, else we might point out how kindred considerations apply to the case of pleasurable melodic sequences. But enough has been said to indicate the interesting character of Mr. Taylor's book, and its value to all who are engaged in the scientific study of music.

Mr. Rice's book is far more ambitious than Mr. Taylor's. While the latter seeks to point out some of the acoustical principles on which harmony depends, the former seeks to give us a "cosmical theory" of music. The book is a conglomerate of irrelevant historical items, and unintelligible because ill-conceived speculation. "As a final result" of this speculation, the author holds "that music is not accidental and human, but dynamical and cosmical." This is as hard to understand as some of the conversations in Margaret Fuller's 'Memoirs.' One does not altogether see what is meant by cosmical, as distinguished from human music, unless we are to suppose, with Pythagoras, that the spheres sing ; nor is the sense of the antithesis between "accidental" and "dynamical" any more apparent. Whatever theory be held concerning the nature of musical utterance, one would suppose that all must agree in regarding it as a mode of giving expression to human feelings. Mr. Rice would appear to dissent from this, but from the language he uses it is very hard to tell what he does mean. His style is made up of that misty kind of declamation in which words seem merely to serve as the indices of vague emotional states rather than as the symbols of distinctly-framed ideas. What is really meant, for instance, by calling music "the beautifier of time"? And what point is supposed to be gained by the assertion that "when Schubert wrote his songs, which penetrate into the very depth of our hearts, he certainly did not arrange the intervals and cadences in the manner Mr. Spencer describes (?). They poured from his brain clear and fresh as the water pours from this mountain-spring"? As if Mr. Spencer, or any other man of common-sense, would deny this, or as if such a remark could have any real bearing on the theory of music regarded as a kind of expression of feeling. "Music is natural—language is artificial. The original man sang long before he talked. All nature taught him to sing," says our author. To what sources of information, inaccessible to Tyler or Darwin, has Mr. Rice had access, that he should know that primitive man sang before he talked ? In point of fact, music is neither more nor less artificial than language. Music is "artificial" since it has been made by man, as a means of emotional expression ; and it is also "natural," since it was undoubtedly in accordance with the nature of man that such a means of expression should be adopted. But such disquisition as this is neither philosophical nor profitable.

The late Herr Wieck's reflections on singing and piano-playing should of course be read by all who are interested in such matters. Herr Wieck was one of the most successful teachers of the present day, and whatever the father and teacher of Madame Schumann might have to say about the art of the pianist could not fail to be interesting. For the general reader who has not tried to get a "singing touch," or who has not worked his fingers to weariness over some lovely but exasperating doubly-compound trill of Chopin's, such a book will no doubt have little interest. But any one who understands the beauties and the difficulties of piano-playing will find the book full of valuable practical suggestions and truly wise æsthetic reflections, none the less attractive for a certain coloring of naïve elephantine humor such as our good German friends sometimes indulge themselves with.

Herr Bussler's little practical treatise on harmony seems to be just the thing for beginners in the art of musical composition, and would no doubt be well worth translating into English.

---

*Our Next-Door Neighbor:* A Winter in Mexico. By Gilbert Haven. (New York : Harper & Bros. 1875.)—Mr. Haven takes his reader upon an interesting journey, but he is an insufferable travelling-companion. We have read many narratives of travel in which the manner has been cruelly detrimental to the subject ; but we remember none in which this has been so fatally the case as in Mr. Haven's singularly diffuse, ill-written, and vulgar record of his observations and opinions. He went to Mexico, as an agent of the Methodist Episcopal Church, to arrange for the establishment of a mission in the capital, and he informs us that he was successful, in so far as that a building suitable for a meeting-house was purchased and opened, in spite of much perfidious counter-plotting on the part of the Catholic authorities. This establishment is now in operation, and with "its dear, delightful prayer-meetings," as the author has it, is hastening on that immediate millennium which he promises the depraved Mexicans at the end of each chapter—"a city holy unto the Lord, with sanctuaries filled with grateful, joyful, holy, intelligent, prosperous worshippers. No rags, no beggary, no Sabbath-breaking, no superstition." In gathering literary materials, Mr. Haven's success was by no means proportionate. His work is mere crude, unconsidered, unrevised scribbling. Its diffuseness exceeds all tolerable bounds, and a good half of it, we should say, might have been suppressed without our knowledge of Mexico suffering a jot. There is page upon page of incoherent chatter about wholly irrelevant things thrust at us without rhyme, reason, or grammar, interspersed with witticisms of a style peculiar

to the author, and garnished with his views upon Darwinism, Tyndallism, the lager-beer question, the tobacco question, the female suffrage, the tombs in Mount Auburn Cemetery, and the opinion of the "Misses Warner" regarding them, the stability of the Prussian army, the merits of "Mr. George L. Brown" the artist, the criminality of Mr. Bryant in not leaving Homer to Mr. Longfellow to translate, and other topics equally interesting in themselves but equally wide of the reader's actual care. If we add that Mr. Haven's tone is inordinately ignorant, bigoted, flippant, conceited, and ill-conditioned generally, we perhaps complete the sketch of the most offensive literary personality it has lately been our fortune to encounter.

He entered Mexico at Vera Cruz, spent, apparently, the greater part of the winter at the capital, and then journeyed northward past Queretaro, the scene of Maximilian's execution, through the silver mines of Guanajuato, to San Luis Potosi, and thence to Matamoras, by a three-weeks' stage-drive, which, for reasons of the author's own, figures in his pages as a sea-voyage, the long chapters devoted to it being entitled "Out at Sea," "Mid-Ocean," "Nearing Shore," and "Into Port." For a serious book of travel this is misleading, but it is a specimen of Mr. Haven's irrepressible humor. Here is another: "It is a baby landscape, and all the more charming for its infantile littleness. The sun goes down as we go up, and by the time the top is reached the baby, in its cradle of lofty hills, has gone into shadow and approaching sleep." Here is yet another: "You have heard of the silver mines of Mexico? Who has not? Curiosity and churchianity led our first steps to these treasures." The following should perhaps also be interpreted as a genial pleasantry addressed to that large and respectable section of the community who confess to a relish for malt liquor: "I tasted it [the pulqui], and was satisfied. It is only not so villanous a drink as lager, and London porter, and Bavarian beer, and French vinegar-wine, and Albany ale. It is hard to tell which of these is stinkingest of the stinking kind." It is true that here is another passage which seems to re-establish Mr. Haven's gravity at the expense of his politeness: "How glad I was to read in Monterey last Saturday that Massachusetts had repealed the Beer Act, and by such a grand majority. The fall of '66 is the rising again of '73. Though she may fall again, it will only be to a perpetual struggle until she shall attain a permanent deliverance. How far shines that good deed in this naughty world! Away across the country and into this land, that no more dreams of prohibition than it does of Protestantism, burns this ray of the coming sun that shall renew the face of all the land and of all lands." Here is a touch which the reader may interpret as he chooses: "I think some of the most scared anti-agrarians would be almost as fanatical and wise as Wendell Phillips, the wisest man as well as the most eloquent of his generation, could they but look on these Mexican pictures." "Take heed in time," the author eloquently adds, "and let Christianity have its perfect work, or anti-Christianity will have its."

Mr. Haven was apparently an active traveller; he used his eyes sharply and saw what there was to be seen. He appreciates ungrudgingly the extraordinary beauty of the great Mexican table-land and its extreme charm of climate—though he judges the people from that exclusively hostile and contemptuous standpoint which sacrifices discrimination to self-complacency. Mr. Haven does not appear to have come in contact with Mexican society and manners at any point whatever—an unfortunate shortcoming in a missionary. But were his merits as a traveller very much greater than they are, they would be quite swallowed up in the unqualifiable vulgarity and flippancy of his narrative. We do not think with him that the Mexicans are going to leap into civilization through the forswearing of beer or the erection of Methodist conventicles; but we nevertheless have the cause of civilization at heart, and we should feel as if we were rendering it a very poor service if we recommended any one to read Mr. Haven's thoroughly ill-made book.

---

*The Morals of Abou ben Adhem.* By D. R. Locke. (Boston: Lee & Shepard.)—During the struggle between Andrew Johnson and Congress at the end of the war over the Reconstruction policy of the former, special prominence was acquired among American political humorists by "Petroleum V. Nasby," the Postmaster at Confederate Cross-Roads, in the State of Kentucky. Mr. Locke, who under this disguise exposed the morals and policy of the unregenerate Democracy, has now made his appearance again, as a social satirist, in a book called the 'Morals of Abou ben Adhem,' but not so successfully as in the first case. In the political field he was more at home, and, like Mr. Thomas Nast, had that perfect conviction of the moral superiority of his own party to any other which is so necessary to make literary warfare of the satirical kind successful. There were many good hits, local, to be sure, and not likely to occupy a high place in general literature, but still palpable hits, scattered through the pages, in which the Postmaster, and his whiskey-drinking friends at the Cross-Roads, revealed in their frank, chivalric way all their meanest, lowest, and foulest aims, thoughts, and hopes, their solemn detestation of the negro, and their resolute determination that under no circumstances should he "invade their homes" or marry their daughters. The 'Morals of Abou ben Adhem' show a deplorable falling off from the spirit shown in the letters of Nasby. The book consists of a series of parables addressed by Abou ben Adhem, who is represented as a sage, an emigrant at some extremely remote date from the East, now residing in the wilds of New Jersey. His age and wisdom are supposed to be beyond those of man, and to his tent repair the old and the young of New Jersey and the neighboring States for advice on such well-known topics as the mutability of human affairs, the faithlessness of woman, the desirability of riches, and the attainment of happiness. The answers they receive are a strange mixture of nonsense, and what we must call, honestly speaking, very ribald wit, jumbled together in an absurd way, and pointed now and then with not very recondite local allusions as, for instance, to the morality of the New York Legislature or the size of the New Jersey mosquito. The lessons conveyed by the sage are not very distinct, and the humor altogether is somewhat of the order which flourishes among police-court reporters. At the end of the book it is discovered that the sage is nothing more nor less than a counterfeiter, who retires on the approach of the police, leaving his dies, wig, beard, and other property behind him. Altogether, the aim of the volume is rather incomprehensible to us; but it might be translated into some foreign language, French, for instance, and in a popular magazine would no doubt attract attention, as illustrating the more recent tendencies of the school of humorists founded by Artemus Ward—though we should be rather at a loss to say what these tendencies are beyond a laudable desire to raise a laugh at whatever expense.

---

*The Satires of Persius.* Edited by Basil L. Gildersleeve, Ph D., LL.D. (New York: Harper & Brothers. 1875.)—In this edition of Persius we have Otto Jahn's last (1868) recension of the text; an elaborate introduction, which treats of the life of the poet, the sources of his culture, his style, his relations to other Roman satirists, his philosophy, etc.; an extensive commentary, preceded and accompanied by synopses of thought, a critical textual appendix, and a full index to the notes. The plan of Prof. Gildersleeve is an excellent one, and it is in the main so well worked out as to increase our regret at the risk which he constantly runs of wearying his readers by frequent repetitions and by a general over-fulness, and of repelling them by his own peculiar style. The introduction contains what would naturally be sought there, but much also that is quite irrelevant. Thus, the peculiarities of Seneca in thought and style, and the amount of onomatopœia and of conscious motive in the build of Homer's verses, are no doubt interesting subjects, but their discussion here is purely gratuitous and makes the whole essay read like a farrago. Much of the introductory matter, too, reappears further on in the book; thus, after the text comes the life of Persius in the ancient Latin and much less diluted form. Again and again in the commentary recurs the question of Persius's indebtedness to Horace, though the question had before been discussed through four or five pages. Along with the notes the editor's view of the satirist's line of thought is thrice stated: the general scope of each satire is first given, then expanded into a minute analysis, and then the analysis is broken up and in a somewhat reduced form distributed throughout the body of the commentary. The deviations from Jahn's text, and the differences between Jahn's readings in 1843 and 1868, are given at the pertinent points in the notes, though the critical appendix at the end was especially designed for that purpose.

The literary style of a book prepared for educational purposes is only less important than its matter. Though Prof. Gildersleeve ordinarily expresses himself in a dignified and racy manner, at times he trifles with words, at other times he certainly appears pedantic. After reading in the Introduction of the "chipped chips" of Lucilius, and of Juvenal as "snubbed snob," we are less surprised to come, among other trivialities, upon the wretched (and misspelled) pun in the note to II. 51. In his endeavor throughout the commentary to find colloquial parallels to his author's quaint expressions, the editor seems to us to go altogether too low down in our language. Persius was a satirist of austere moral earnestness, and to treat him as if he were a comedian is but to travesty him. Many of the remarks and notes must be entirely lost upon the average student, so surcharged are they with untranslated passages from and tantalizing allusions to a wide range of authors in several languages. The note on V. 91 is useless to those not familiar with Hebrew. The grammatical and philological notes evince the editor's ripe scholarship in this field, and his exegesis of knotty passages will, we think, generally commend itself. Here and there the stu-

dent will wish that the conflicting views of commentators had either been entirely omitted or more judicially balanced, but no Latin poet justifies so little positiveness of exposition as the enigmatic Persius.

While taking these incidental exceptions to this edition, we cordially welcome it as a valuable addition to our means of advanced Latin scholarship, and we hope it may enlarge the little circle of Persius's readers and admirers. It cannot of course make Persius popular, even in that limited sense in which the satires of Horace and Juvenal may be called popular. The question will still be widely asked whether the slight contributions that the young Etruscan preacher made to practical ethics from the more humane side of Stoicism, the unique phase that he constitutes in the history of Roman literature, and his own virgin modesty, really compensate for the narrow range of his ideas and figures, the bookish view that he took of society, the meagreness of his poetic gift, and his extremely crabbed style.

*HENRY HOLT & CO.'S SCHOOL-BOOKS*

include, among others, Freeman's Historical Course, the Class-room Taine, Siglar's English Exercises, the Ord. Series of Classics, Whitney's German Course, Otto's French and German Courses, etc. Reference is made to the faculties of all leading institutions. Catalogues sent on application. Address

# EDUCATION

AT THE

# Centennial Exposition.

What is to be Done in Educational Matters at the Centennial Exposition? has been the universal enquiry among educators. The *New England Journal of Education* proposes to meet the enquiry by issuing a special Centennial Edition July 10, which shall give full information on this subject. Every College President, every Professor, every Principal of an Academy or School, every public-school Teacher, every School Superintendent, every college student, every school boy and girl, every publisher, every printer, every optician, every philosophical-instrument maker, every school-furniture manufacturer, every artist, every man of science, every chemist—in fine, every one will be interested in the list of important articles, by the most competent men in the country, which will appear in this number.

*LIST OF ARTICLES TO APPEAR.*

GENERAL PLAN OF EDUCATION AT EXPOSITION. By Gen. John Eaton, jr., U. S. Com. of Education.

EDUCATION AT VIENNA EXPOSITION. By Baron Swarz-Senborn, Austrian Commissioner.

PROPOSED EDUCATIONAL CONGRESS. By Hon. Newton Bateman, of Illinois.

PUBLIC SCHOOL-WORK—ARCHITECTURE, ETC. By Hon. J. D. Philbrick, Boston, Mass.

COLLEGES AT THE EXPOSITION. By J. M. Gregory, LL.D., Illinois Industrial University.

SCIENCE AT THE EXPOSITION. By Prof. W. P. Blake, U. S. Commissioner.

ART AT THE EXPOSITION. By Prof. Walter Smith, of Boston, Mass.

100 YEARS OF EDUCATIONAL PROGRESS. By Rev. J. C. Stockbridge, D.D., of Mass.

GENERAL PLAN OF THE WHOLE EXPOSITION. By Dorsey Gardner.

Single copies of this double number of 32 pages may be obtained of any Newsdealer in the United States, or will be sent, post-paid, on receipt of Ten Cents by the publishers. Subscription price, $3 per year, in advance.

The *New England Journal of Education* is the union of all the Educational Journals of New England. It is a large sixteen-page paper, published every week. Office, 16 Hawley Street, Boston.

## TO PROPRIETORS AND TEACHERS OF SCHOOLS.

Conductors of schools, in making their arrangements for the ensuing year, will find it very much to their interest to consider the special advantages for reaching parents and pupils afforded by THE TRIBUNE. It has long been acknowledged to be the best means of communication between schools and those seeking them. Its great advance in circulation now makes its superiority more marked than ever.

With but a single exception (that of a paper not circulating largely among the educated classes, and never having many school advertisements), THE TRIBUNE has the largest daily circulation of any quarto paper in the United States. Its aggregate circulation is much larger than that of any other; and its semi-weekly and weekly circulations are double and treble those of the rivals which come nearest it. These facts have been sustained by the amplest evidence, are certified by the largest advertising agents, and have not been disputed even by rivals.

All advertisers agree that the value of the medium by which they address the public depends not less on the character than the extent of its circulation. The combined test makes the great superiority of THE TRIBUNE still more manifest. No other journal has so large and rapidly-increasing a constituency among the educated classes. No other is so widely and thoroughly read in the higher schools and colleges. No one now disputes with THE TRIBUNE the distinction of specially representing among newspapers the educational progress of the times. Its pre-eminence in these regards was so well understood among educators last year that the school advertisements in its columns exceeded in number and value the aggregate of those in all the other morning papers of New York.

In the community at large, TRIBUNE readers are found always in those families of culture and means from which pupils of schools not supported by taxation mainly come. In no way can the heads of these families be so effectively and directly reached as through the columns of THE TRIBUNE. It is of especial value to first-class schools because of the wide region of country it covers, as well as its large number of subscribers. In New York it has the largest circulation among the best classes. Outside New York the returns of postage, furnished by the Post-office Department, show that its regular circulation is out of sight ahead of any rival. These out-of-town subscribers are nearly all among well-to-do people, the very best patrons of schools. The Daily, in the country, goes generally to bankers, business men, professional men, and wealthy citizens who have retired from business. The Semi-weekly has a very choice circulation (four times that of any other semi-weekly in the United States), mainly among the same classes, at points where they do not have a daily mail, or where they depend on papers nearer home for the telegraphic news. The Weekly is the great farmers', planters', and shop-keepers' paper of the country.

Advertisements of schools will be inserted in THE TRIBUNE, carefully classified and alphabetically arranged, at the following rates:

DAILY TRIBUNE.

| | |
|---|---|
| One insertion, | 20 cents per line. |
| One month, | $3 50 " " |
| Three months, | 10 00 " " |
| One year, | 30 00 " " |

SEMI WEEKLY TRIBUNE.

| | |
|---|---|
| One insertion, | 25 cents per line. |
| One month, | $1 75 " " |
| Three months, | 3 00 " " |
| One year, | 10 00 " " |

WEEKLY TRIBUNE.

| | |
|---|---|
| One insertion, | $2 00 per line. |
| One month, | 6 00 " " |
| Three months, | 15 00 " " |
| One year, | 52 00 " " |

TERMS, CASH IN ADVANCE.

## The Week.

OHIO still continues to be the most interesting State of the year from a political point of view. The election there in October will settle, it is supposed by politicians, two important questions: 1st, whether the "reaction" of last year was the real genuine, original Democratic tidal wave. If it was the tidal wave, then of course it must go on till it carries the ship of state into the centennial harbor; if it was not, the election this year will certainly show it. Then Ohio seems to have been selected, too, as the great inflation "stamping-ground," and many a wise old chieftain is now keeping his lips very tightly closed on the subject of the currency until he shall see by the result of the Ohio vote whether the American people approve the doctrine of Judge Kelley, who says that if the "bullionists" carry the day, "labor will take capital by the throat" and "the scenes of the French Revolution be re-enacted"; or whether they mean on the contrary to stand by the "bullionists." Then, besides this, there is the question of how much the people will endure in the way of candidates; for if the Democrats can elect Mr. William Allen on an inflation platform and "General" Cary on a "free rum" platform, there is no saying what they will not stand, and the 13th of October next they would, among other results, probably draw even the Essex Statesman out of his retirement, and place him once more in the van of reform. It must be said, however, as Mr. Halstead declared at the Schurz dinner, that it begins to look as if the people of Ohio were making up their minds that "as reformers the Democratic party could not be considered a success."

In the other Western States there are some signs of political activity, particularly in Wisconsin and Minnesota. In Wisconsin the Republicans have gone to the length of avowing their "unalterable adhesion to the indissoluble Union of the States," and declare that parties "are only deserving of support" so long as they "advance wise and patriotic principles, and promote the honest and efficient administration of public affairs." This is sound, but it is a little general in its character. It is necessary to examine some of the other planks in order to see exactly what is meant by the "honest and efficient management of public affairs." One of these is a declaration in favor of "the doctrine of legislative control over railroads and other corporations deriving their powers and franchises from the State, . . . which policy was inaugurated and will continue to be fostered by the Republican party of Wisconsin," etc. So it seems that Granger laws are, in the opinion of the Wisconsin Republicans, among the things necessary to honest and efficient administration. They also denounce fraud and war, and are in favor of that kind of resumption which consists of "continuous steps" of a "gradual" character "in that direction"—not a loud, noisy, bullionist tramp, but a quiet, undisturbing movement. It seems strange, considering how widespread is the interest in this kind of resumption among the politicians, that they cannot agree to introduce it. The Minnesota Democrats have also had a convention, and adopted a specie-payment resolution of a different kind, but otherwise the platform is not remarkable in any way.

The *Railroad Gazette* points out that cheap transportation, though we have certainly been having it, has not produced all the results which were expected to come from it. The cheap transportationists have always maintained that if any farmer in the West could have a double-track steel-rail line from his door to deep water, carrying his products to the sea-board for him at a little less than cost, there would be nothing more to ask for. Now, this is exactly what every farmer in the West has had during the recent railroad war. During the month of June the farmer could have every bushel of his grain transported from Chicago to New York for about ten cents, and there was nothing for him to do, on the cheap-transportation theory, but to summon his maid-servants and man-servants and his sons and daughters together, and gather in all the corn and wheat and oats, and send it to the East, and sell it for a great price, thus relieving the hunger of man and beast, and at the same time accumulating wealth. Strange to say, the farmer did not send on his grain to the East, and the Chicago elevators are still full, and the country about Chicago has a large surplus. What is the explanation of this sad state of facts? The cheap transportationists omitted one thing from their calculations: in order to sell, there must be a market. As the *Railroad Gazette* puts it: "Never before could grain move so cheaply, and not often has there been more grain to move at this time of year, and yet the shipments have been unusually small. Evidently there must be something more than low rates of transportation to ensure a large traffic; something even more than low rates and a large supply: there must be a demand also, and in the case of grain this year the demand is just what has been lacking. The farmers have got low prices, the carriers have got lower ones, and they have sold little and carried little." If we should proceed further, and enquire why there is no market, we should find that this was owing to a general depression, which was caused by a panic, which, again, came from an over-speculation in railroad-building, which the farmer had himself fomented by mortgaging his farms and taxing himself, and giving this money to the monopolists who were building roads for him. It seems a bad case altogether. He has done his best to become rich, he has mortgaged, and he has repudiated his mortgages; he has aided roads, and he has swindled them; he has tried inflation, and contraction too; and yet he cannot make more than seven or eight per cent., and the worst of the whole is that even that pittance has to be made by honest industry.

Summer dulness has characterized the Wall-Street markets. Gold has fallen over one "point," the decline having been started by sales for the account of a weak and overloaded speculator, and been maintained by the favorable tenor of the foreign news. The Bank of England reduced its minimum discount rate to three per cent., and raised its reserve four per cent., without having added largely to its stock of bullion. Mercantile failures in London continue to be reported, but they are of houses involved in previous suspensions. No new weakness has been discovered, and it is the impression outside as well as inside the Bank of England that there will be nothing to impede seriously the tendency of the London money market to extreme ease. Gold continues to be exported from here in large amounts; the shipment for the week was about $3,000,000, and the total for the year over $55,000,000. This gold is not now sent to strengthen accounts, but merely to pay debts which can be paid in no other way. The foreign-trade statistics of the United States for the first eleven months of the fiscal year which ends June 30 show a decrease in imports of $28,586,672 compared with the next preceding year, and a decrease in exports of $69,556,083, or, reduced to gold value, of $58,917,474. These figures do not include transactions in securities, which are an unknown quantity in all estimates about the foreign trade.

There is reason to believe that while the gold exports may be large for six weeks they will not come up to the amounts sent in the past month, since there is a growing disposition in Europe to take first-class American bonds. The New York money market is overflowing with loanable funds, and the best mercantile paper, not

maturing until December, can be sold easily at 4 per cent. For some unexplained reason the New York banks reported a loss in legal tenders during the week of over $3,000,000, but the amount held is still over $70,500,000. The money writers of some of the papers seem to have just awakened to the fact that the "Finance Bill" of last session has thus far been working contraction. It has many ridiculous features, like that which directs the substitution of silver for fractional currency, which the Government never agreed to redeem in anything except U. S. notes, and which makes "silver resumption" the grand point of the Treasury policy; but it may be said in its favor that as yet no inflation has been caused by it. The error in it is in not making it the first duty of the Treasury to redeem its dishonored promises to pay gold for the Treasury notes which, by the Legal-Tender Act, were made the standard currency of the country, into which all other kinds are redeemable, whether U. S. fractional currency, bank-notes, checks, or private written promises.

---

Gen. Frank P. Blair, who died last week at St. Louis, was born in Kentucky; his father was a Marylander, his mother of Virginia descent. It was not singular, therefore, that he should volunteer to serve in the Mexican war, and if he came out of it a free-soiler he had the example of his equally erratic townsman, Cassius M. Clay. Blair's field of action was Missouri, and from fighting for the spread of slavery in Texas he returned to fight against its extension westward. As a member of the State legislature, he engaged in a border warfare for which he was peculiarly fitted, and in which his courage was displayed as conspicuously as ever before or afterwards in battle. His death at that time would have been a national calamity; and later, when the civil war broke out, his personal activity in raising forces to defend St. Louis and rescue the State from the secessionists, was the main cause of the success of both these endeavors, so essential to the circumscribing of the Rebellion in that quarter. As colonel, brigadier, and major-general, he won a high distinction among volunteer officers; he fought gallantly at Vicksburg, and accompanied Sherman in his march to the sea. He was first elected to Congress in 1856, and in proposing a measure which looked to the colonization of the blacks in Central America he manifested what we may call the Southern phase of abolitionism—an opposition to slavery in which sentiment for "niggers" found no place, and which was accustomed to boast that in any conflict between the slaves and their masters a white man had no choice but to take sides with his color. To this habit of mind is doubtless traceable the attitude of both the Blairs in the days of Johnson and Reconstruction. Their hostility to the carpet-bag governments was first of all based on their abhorrence of the spectacle of black men as voters and office-holders, while white men, no matter how worthy of disfranchisement, were disqualified from going to the polls. Gen. Blair's recklessness culminated in his famous Broadhead letter, advising, with much violence of feeling and language, the forcible undoing of the whole fabric of Reconstruction, and restoring the whites to their legitimate supremacy. The Democratic nomination of him for Vice-President on the ticket with Horatio Seymour had the natural effect of politically killing all the parties concerned. With the exception of an insignificant brief term in the United States Senate, Gen. Blair has since been withdrawn from public notice, and has been forgotten as a "dangerous character." He was a graduate of Princeton, and was in his fifty-fifth year.

---

We hear a good deal already of the preparation of organized expressions of continued confidence in Mr. Beecher on the part of the ministers of his own and other denominations. There is talk of a widely-signed testimonial of this character, and of a great clerical meeting in the fall for the purpose of giving him what the reporters call "an ovation." We do not know how true all this may be, but it is at least very probable, and it therefore calls for one or two observations, which may not occur to all ministers. The only and the main reason for getting up these testimonials to Mr. Beecher, as for the publication of the sympathetic letters or telegrams he receives, is the fact that doubts still prevail as to his innocence. Had the trial resulted in his complete vindication, they would not have been necessary, and he would not have cared about them. Nor would he care about them now except in so far as they may help to establish his innocence in the public mind. If they meant, "Guilty or innocent, we love you still"; or, "Guilty though you be, we love you still," his friends would not solicit them, and they would not be welcome, because they might be mere expressions of Christian pity for a very bad sinner. He invites or enjoys them because they mean or will be taken to mean, "We love you because you are an innocent and persecuted man." In other words, they are put forward as quasi-proofs of his innocence.

---

Now, what the portion of the public which doubts his innocence will say when these demonstrations begin is that ministers, as such, are no better judges in a matter of this kind than other people; that they have no special training or skill in the weighing of proof in a controversy over a question of fact; and that to offer their judgment as something which ought to decide an issue over which laymen of all classes and conditions have differed, is an attempt either to make a deceptive, confusing use of their official position, or to claim for them special qualifications which they do not possess. In either case, the attempt would savor of dishonesty, and would hinder rather than serve the cause which ministers have at heart, and which, after all, gives them most of their interest in Mr. Beecher's case. But the public of which we speak would not only not give them credit for being specially qualified for such a task, but thinks them specially disqualified by professional bias. It knows that it goes hard with ministers to believe another minister guilty of immorality, especially if he is eminent, and that they are apt to dread the effect of his conviction upon religion in general. Their interference, therefore, in such cases is apt to bring comfort to the accused at the cost of things more valuable and important than any man's reputation. If we might venture to offer advice to ministers in this business, it would be to keep out of it, to sign no manifestoes or testimonials, and join in no hurrahing or other exculpatory uproar. What the highest interests of church and state now demand is that it should be allowed to drop for good.

---

The way in which the American riflemen have been received in Ireland is, for some reasons, very surprising, however gratifying it may be to their countrymen on this side of the water. The gentlemen composing the American Team, however worthy, were entirely unknown to fame here before they started, and in fact are only distinguished as good shots. They have, however, been received in Dublin and Belfast with honor and enthusiasm which, we believe, no Americans, however eminent in their own country, have ever called out, and which indeed indicates, or ought to indicate, that the people and officials of those cities consider rifle-shooting one of the highest of human arts, and have lately conceived so extraordinary an affection for the American nation that the sight of any American possessing any accomplishment whatever calls forth the wildest display of it. We must confess honestly we would rather have seen the two mayors and corporations and the Fellows of Trinity College and the population going crazy over an American poet or orator, or soldier or statesman, and think it would have been a little more becoming. The demonstration, too, suggests the question, What species of welcome has been reserved in Ireland for representative Americans who are really distinguished in the higher regions of human endeavor? If four or five such persons now went to Ireland, would not decency require a gladiatorial show or human sacrifices in their honor? The result of the various matches which have taken place since the international one seems to prove conclusively what one of the Irish Team—Mr. Thompson—asserts in a letter to the papers, that as a team the Americans are, as far as Great Britain and Ireland are at present concerned, invincible,

owing to their drill and discipline and the evenness of their shooting. That is, they work excellently well together, and have no shots markedly inferior to the others. Taken individually, however, they can be matched with more or less success. A picked four of the Irish Team, for instance, are probably as good marksmen as a picked four of the American Team. The fact that the competition for the Elcho Shield is restricted by the terms of the gift to native clubs, excludes the American Team from the forthcoming contest at Wimbledon. There is offered instead a match, to come off afterwards, between the American Team and a team selected from the three English teams (English, Irish, and Scotch), but this the Americans have refused.

---

Messrs. Moody and Sankey have been the means of creating no small disturbance at Eton, and of producing an amount of correspondence in and out of the newspapers between high dignitaries which, considering everything, seems at this distance rather ludicrous. They determined, it appears, to go down and hold a service at Eton for the benefit of the boys, and had a large tent erected for the purpose in one of the meadows, whereupon Mr. Knatchbull-Hugessen, author of the well-known fairy tales and a member of Parliament and father of an Eton boy, hurried down, and remonstrated vigorously with the Provost for proposing to permit the boys to attend such services, to which the Provost replied that he had proposed nothing of the kind, and that the affair was entirely within the jurisdiction of the head-master. Hurrying to the head-master, Mr. Knatchbull-Hugessen learned that Dr. Hornby proposed to pursue the same course with regard to the revivalists' services that he pursued with regard to horse-races and fairs in the neighborhood—that is, not interfere, but leave the boys their liberty. Mr. Knatchbull-Hugessen published the correspondence, and, the excitement increasing, seventy-one members of Parliament signed and sent to Dr. Hornby a solemn protest against the attendance of the boys at the meeting, and were met again by the Doctor's old argument in favor of liberty. The boys then took the matter up, and split into two parties, and signed remonstrances on both sides. The chief of the local police then intervened, and gave notice that he could not preserve order in the tent. The revivalists then asked for the use of the Town Hall, and the Mayor granted it, but subsequently got frightened, and refused it. Finally, Messrs. Moody and Sankey determined to celebrate their awful rites in an enclosed garden in the rear of a linen-draper's house. There were one hundred and fifty of the boys present, and four or five of the masters, and about four hundred other persons, including several men of rank. Mr. Sankey sang some of his hymns, and Mr. Moody delivered one of his usual addresses, and was attentively listened to. His exhortation to seek safety from death and sin and judgment, and to qualify themselves for the high positions which many of them would doubtless fill in church and state by conforming themselves in all things to God's will, apparently did the boys no serious harm and left the Church of England unimpaired. This fuss, and that about Mr. Keet's claim to the title of "Rev.," seem to indicate a great, and in these days dangerous, deficiency in healthy commonsense among many active and pious members of the English Establishment.

---

Little is talked of in France beyond the inundations. The report of the Committee of Thirty on the constitutional bills has been under debate in the Assembly, M. Laboulaye being the principal spokesman for the Committee; but none of the speeches were remarkable except that of M. Louis Blanc, whose residence in England does not seem to have taught him much political wisdom, and who cried out for government by delegates, untrammelled by a constitution, and charged with the special care of "the rights of man," somewhat to the disgust of Gambetta and the main body of the Left, who are now very moderate, and would hardly be recognized by the old Reds of 1848. But then politics seems a trifling affair compared to the awful devastation wrought in the southwest by the overflow of the Garonne and its confluents, such as the Tarn. The southern portion of France has for the last century suffered terribly from inundations, but principally through the streams rising in the Alps and their spurs. The valleys and plains adjoining the Pyrenees have suffered less, but are perhaps, owing to their richness and fertility, more capable of damage than any other part of France. It is estimated that the late rise in the Garonne has destroyed $60,000,000 worth of property. The estimates of the number of lives lost are of course wild; but in Toulouse alone more than 200 perished, and as the rise in the river was very sudden, the loss has doubtless been very heavy also in the smaller towns and villages. This is the fourth serious inundation by which this district has been visited within the last fifty years, and it will doubtless give fresh zest to the discussion of the forest question, which has so long occupied French engineers and statesmen, and which Mr. G. P. Marsh has expounded so fully in his book on 'The Earth.' No effort of engineering can, it is now admitted, save these great southern plains and valleys from these terrible visitations, nor anything else except the revival of thick forests in the mountains. A curious and characteristically French feature of the crisis has been the prompt appearance of Marshal MacMahon and his staff on the scene to represent the Governmental Providence. Louis Napoleon did the same thing on a similar occasion, and rode about among the ruins with a bag of gold pieces hanging to his saddle-bow, with which he "succored the unfortunate."

---

The close of the last session of the Prussian Parliament has witnessed two important additions to the constitutional system of the kingdom: one is a diminution in the powers of the administrative officers in the country districts, which is, however, of comparatively little interest to foreigners; the other is neither more nor less than the establishment of the citizen's right of appeal to the courts against the decisions of the bureaucracy, on the Anglo-Saxon model—a right which it has always been hitherto impossible to persuade Continental legislators would not prove anarchical in practice. To this day, a proposal to give a citizen the right to sue a Government officer for an illegal exercise of power makes even a liberal Frenchman almost shudder. There is little other news of importance from Germany, beyond talk of the springing up of a coolness with Russia, owing to the Emperor Alexander's having foiled the designs of the military party against France.

---

The Belgians are having almost as much trouble with the Catholic question as the Germans. In no part of Europe are the Liberals more anti-Catholic and the Catholics more bigoted, than in this little kingdom. Nowhere else are the priests so influential among the peasantry. Under the influence of the recent wave of enthusiasm which has been passing over Catholic Europe, the Catholics have begun to give their public processions unusual prominence and splendor, which has led the Liberals to attack them in the streets, and bloodshed has only been prevented by the interference of the troops. In the midst of these domestic broils a fanatic named Duchesne wrote to the Archbishop of Paris, offering to kill Bismarck for a consideration, and there being apparently no means provided by the Belgian statute-book for the punishment of an offence of this sort, the German Government called for more legislation, to which the Belgians replied in substance that they would legislate as soon as they, Germany, set the example. A bill has, however, been introduced into the Chambers, and passed by a heavy majority, making a proposal to kill persons outside the kingdom a penal offence, and the German Government expresses itself satisfied. There is a good deal of discussion in the European papers as to the causes of Belgian fanaticism—why it is, for instance, that the belief in the grossest kind of miracles should be widely spread among the middle class of one of the most flourishing manufacturing countries in Europe; but we have seen nothing that can be called light yet thrown on the subject.

## POLITICAL MELANCHOLY.

THE orations of the last month in all parts of the country have been delivered in about equal proportions by the hopeful and the despondent, or, to put it differently and perhaps more correctly, by the satisfied and the critical. Looking over the reports, we find that as a general rule the ministers and professors and "gentlemen of culture and refinement" who have spoken take a gloomy view of things, while the politicians see everything in the best light. Dr. Woolsey, for instance, is by no means content, while Mr. Boutwell wonders what there is to trouble any reasonable man. A foreigner who landed in the country for the first time in June would in fact find the various addresses called forth by the anniversaries very puzzling reading, and would find it impossible to reconcile views so opposite emanating from men apparently equally sensible and patriotic. How can the condition and prospects of the country, he would say, look so dark to one set of persons and so bright to another, both having been brought up under much the same traditions, and political and religious ideas, and with much the same social surroundings? I see why the Duc de Rochefoucauld, he would add, does not agree with Gambetta about the way things are going on in France, and why Lord Derby should take a very different view from that of Bradlaugh about the needs of England; but why are Dr. Woolsey and Mr. Adams sad about the United States, and Senators Boutwell, Wilson, and Morton gay and sanguine?

The difference is of course in part one of temperament, but it is in part also the result of a misunderstanding, which is not without its humorous aspects. Men look at the affairs of the country, as they look at their own affairs, through an atmosphere colored in greater or less degree by their age, the condition of their health, and the course of their personal fortunes. But then there is nothing which causes more difference of opinion about politics than difference of ideal. Mr. Boutwell probably thinks, and doubtless would say, that a state of society in which a man like him could rise to the highest offices of the Government, and, after managing the national finances, pass to the dignity and responsibility of Grand Councillor, was as good a state of society as any one could desire. If, on the other hand, we asked Dr. Woolsey's opinion, he would, if he chose to be frank, treat Mr. Boutwell's rise as a very discouraging symptom, indicating the existence of great evils. In fact, each man, when he is discoursing about the condition of his country, has in his mind a different ideal, or, in plainer English, is talking about a different thing, and there is, therefore, little profit to be got from comparing his discourse with that of his neighbor. As a general rule, a successful politician of the class to which Mr. Boutwell belongs thinks, like every other successful man whose imagination has received no cultivation, that the state of things in which he has succeeded is as good a state of things as any one ought to look for, and he may think so with perfect honesty. A successful manufacturer who has made a great fortune is not apt to be troubled about the state of the revenue laws, or to fret over the relations of labor and capital. A soldier who has risen to power in the midst of revolutionary anarchy is not apt to sigh over the want of settled government. A great orator who is able to sway large crowds at will is not apt to be an advocate of sobriety and caution in the management of political affairs. Most prominent American politicians, like the politicians of all countries, are the product of the existing state of society, whether it be bad or good, and they naturally and inevitably admire the soil on which they grow. Wondering that Boutwell, or Morton, or Logan is not afflicted by the evils of the present day is like wondering that Lord John Russell liked government by Whig peers, or that Prince Metternich thought well of absolutism, or that the French marshals of the First Empire enjoyed war and supported Bonapartism.

But it is not the politicians only who are satisfied with the actual condition of the country, and feel proud of it, and hopeful about it. The great body of the people share their feelings, and with solid reason. Sentiment apart, every man likes the political system under which he is happy, and the American people are happy as no other people is, in that the average man feels, as he feels nowhere else, that he is part of, and exercises a direct and appreciable influence on, a great and successful political system, in which nobody is any greater or more powerful than he is. There is no use in trying to convince him that he ought not to get supreme comfort out of this, that he ought to prefer a system in which the work of government is better done by men of higher training and without so much of *his* interference. To get him to prefer Charles Francis Adams to Boutwell for high offices of state, you have to do more than prove Adams's superior qualifications; you have to make him feel as comfortable with Adams as with Boutwell; and to secure this you would have to take him young and train him to love a different ideal of government from that which he now loves. He prefers, as at present advised, a blundering and ignorant statesman, provided he does not blunder too badly, to a trained and accomplished one, because the former does not wound his self-love or make him feel his disadvantages of fortune or culture; and just now he gets a good deal of his happiness out of the absence from prominent positions of people who give themselves airs of superiority to him and are probably not in entire sympathy with him. It is not wonderful that under these circumstances the politicians try to persuade him that he is right to consult his feelings in the matter; that, after all, ignorance and incompetency are not the most serious defects in a politician; and that a statesman really needs "magnetism" more than training.

What, in short, makes the scholars and "gentlemen" so melancholy, and what separates them so much in feeling from the masses on these occasions of popular rejoicing? The fact that they have preserved an ideal of the state which, though undoubtedly the true one and the only one that will last, is one which this democracy, like all modern democracies, has for the moment laid aside. That the ideal will be taken up again, and that all culture and progress tend to bring it back, we have no sort of doubt. For the present, however, as for the last fifty years, the thing on which the popular heart has been set is the possession of rulers like the common run of people, who do not pretend to be any better or wiser than their neighbors. That the popular heart should be set on this just now is a very natural bit of reaction from the class rule of several preceding centuries. It was sure to come whenever and wherever the government passed into the hands of the majority. The tendency of democracy thus far has everywhere been of late to make character and training of less consequence as qualifications for office, and this not so much through hostility to character and training as through hostility to exceptional persons, or persons who, for any reason, declined to be numbered with the mass. That this has brought with it great evils there is no denying. Most of the attempts to show that it has not done so are wretched pieces of sophistry. The only thing for an honest man to say about it in answer is that these evils are not so great as some people think, and are not irreparable, and that the social instincts of the race tend constantly to bring people back to the old standards of excellence in government. That men who cultivate their imaginations, however, by the contemplation of perfection in all departments of human activity, as men of reading and reflection usually do, and whose main interest comes to lie not in making things do, but in considering whether they cannot be improved, should be troubled by the present state of things here, is nothing either to be wondered at or regretted. That once a year they should be tempted to lift up their voices, in pulpit or on platform, and declare their discontent, and give their reasons, is something for which the country ought, on the contrary, to be very thankful. There never has been an age or generation more self-satisfied, more prone to find its happiness in meat and drink, than this one of ours, and anybody who reminds it strenuously that a government which fills the belly and counts the ballots is, after all, not the highest result of civilization, and that making one man as good as another is not the sole or the chief end of political society, does the state an inestimable service.

## A NEW KIND OF VETO.

IN all the State constitutions which have been adopted within the last five years, special efforts have been made by the reformers who drew them up to prevent fraudulent or tricky legislation. That this evil exists, every session of every State legislature gives renewed proof in the shape of bills passed in the absence of a quorum, bills containing clauses smuggled into them and not voted upon at all, bills passed so hastily as to prevent proper consideration, bills passed in the guise of amendments or joint resolutions. As a general rule, these fraudulent acts are to be traced to one or two interested persons, and do not by any means necessarily imply that a majority of the legislative body approves or countenances them. Like any public body, the legislature *qua* legislature is interested in having its proceedings orderly and honest; and no doubt if our legislatures to-day, as formerly, had that feeling of permanency which comes from the re-election, year after year, of a considerable number of veterans, they might be relied upon to protect themselves against fraud. But from causes which are so well known and understood that there is no need to recapitulate them, the modern legislature is a body of a most fluctuating character, possessing so few men of legislative experience that these count for nothing, and sitting for so short a time that their proceedings attract small attention. There are few among them who know anything more than the rudiments of parliamentary law; while to the shrewder and more cunning the nice and complicated system elaborated in Cushing's and other manuals seems designed to confuse the unwary, and to offer opportunities of the richest kind to the wise. Parliamentary law, in fact, in modern times, affords just the weapon which the dishonest legislator needs to impose on the body of which he is a member.

Recognizing these facts, the new constitutions undertake to provide against the dangers to which they point by minute directions as to the precise steps which legislation shall follow. A convention now sitting in Missouri, for instance, has adopted an article on legislative proceedings which contains no less than eighteen clauses on this subject, providing, among other things, that "no law shall be passed except by bill"; that no bill shall be amended so as to "change its original purpose"; that every bill shall be read on three different days in each House; that no bill shall contain more than one subject, and that clearly expressed in its title; that amendments must be incorporated in bills by engrossment, and the bills, as thus engrossed, printed under the supervision of a committee, who are to report upon the regularity of all these proceedings; that no bill shall be considered for final passage unless it has been reported upon by a committee and printed for the use of members; that no bill shall become a law except on a yea-and-nay vote, entered on the journal, the record showing a majority of the members elected as voting in its favor; that no act shall be revived or re-enacted by mere reference to the title, but shall be set forth at length; that no act shall be amended except by setting forth in full the provision amended and the amendment itself; that when a bill is on its final passage, and, failing to pass, a motion to reconsider is made, the vote on the motion to reconsider shall be taken immediately, before the House proceeds to any other business.

Provisions like these, or designed to effect the same end, have been introduced in Illinois, Ohio, Pennsylvania, Michigan, and New York. They indicate more strikingly than even the provisions with regard to special legislation, now so common, the prevailing tone and temper of our period of constitution-making; for they proceed not upon the theory that certain subjects have been proved by experience improper for legislation, but on the much simpler theory that the legislature is a body which cannot be trusted to act honestly. We are so accustomed to the dishonesty of legislatures that we do not think much about it, but we can get a glimpse of how it ought to look to us by reflecting on the tremendous change that would have to come over a country before constitutional checks like these could be imposed on the judiciary. Imagine a judiciary article, for instance, providing that no judgment or decree should be valid unless the judge should append to it a statement under oath that during the argument he had been continuously present, that his attention had not wandered, that he had remained awake throughout all the discussions which had taken place, that citations of authorities contained in the decision were all genuine, and that it contained no perversion of law or fact.

Of course the difference between any such provisions with regard to the legislature and the courts is that in our system the courts are above the legislature, and we long ago adopted the plan of enforcing restrictions on legislative excesses through their agency. And this brings us to the question suggested by a writer in the current number of the *North American Review*, whether in these new constitutions we are not showing some signs of a tendency to forget what are the limits of this sort of restriction. In the older constitutions, like that, for instance, of the United States, there is no difficulty, or comparatively little, in enforcing constitutional restrictions through the courts. If a law is passed, for instance, every lawyer can tell with tolerable accuracy whether or not it violates the obligation of contracts and is therefore unconstitutional. This is an extreme case, too, and most of the restrictions are much simpler. No State can very well help knowing what making anything but gold and silver legal tender means, or what an *ex-post-facto* law is. But, as the article to which we refer points out, some of the new restrictions are of a very different order, and it is important to know whether they are restrictions which are to be enforced by the courts or not. With regard to such acts of the legislature as on their very face violate the constitutional restrictions, there is of course no difficulty. An act, for instance, reviving another act by the title, would be clearly void and not enforcible in any court; but, with regard to restrictions upon the parliamentary proceedings of the legislature, what are we to say? Suppose two readings of a bill take place on the same day; suppose it is alleged that the copy of a bill printed "for the use of members" was really kept out of their way—as, for example (to take an instance of legislative proceedings, not from any manual, but from the history of the Pennsylvania Legislature), by turning off the gas; suppose that a "majority of the members elected," as the returns have been decided by the legislature, do actually vote for a bill, but that they do not constitute a real majority, owing to election frauds—in such cases as these, will the courts investigate the proceedings, and in an ordinary suit will the parties be at liberty to summon the whole of some old expired legislature into court or bring in all the election returns to decide the question? If this can be done, it clearly gives the courts an enormous power, for it makes them virtually the judges of the qualifications, elections, and returns of the legislature, and the sole judges of the regularity of its proceedings. Hitherto the very reverse of this has been the case, and the courts have carefully refrained from interfering with what have been supposed to be the sovereign attributes of the legislature. There are, however, other objections more serious, viz., that if the courts are to execute these provisions in the ordinary way, it will involve all legislative proceedings in much greater uncertainty than they now are in; for after any excited session of an evenly-divided legislature, we shall not know until every one of the acts passed by it has been through the courts—a process which may take a lifetime—what are the laws passed and what are not. In such a legislature as that of Louisiana, for instance, even before the Wheeler Compromise was settled, how could it ever be told what was meant by a "majority of the members elected"? Indeed, we have lately seen that, without going so far away from home, the same sort of difficulty may arise in a Northern State. In New Hampshire, the courts expressly declined to interfere, on the ground that it was not their business. On the other hand, if the courts in States such as Missouri decline to interfere, all these constitutional provisions become mere empty forms—a conclusion to be much deprecated. We have never in this country adopted the pernicious system of European constitution-making, which makes the "higher law" consist so largely of vague generalities incapable of enforcement because no penalty is attached to their violation.

In this dilemma the Missouri constitution-makers have boldly taken the bull by the horns and solved the question in the only way it seems to us capable of solution. Proceeding upon the supposition, probably correct, that there will always be in any legislature a minority of members opposed to any scheme of fraudulent legislation, they have determined to put it in the power of this minority to obtain what amounts to a judicial veto of the bill, by summary proceedings in the courts. They have not by any means abandoned the executive veto, but they have reinforced it by another. They provide, in the first place, that if in either House the objection is made that any of the provisions we have been considering have been violated, the House shall pass upon it, and if the objection is sustained the presiding officer shall not sign the bill; but if it is not sustained, then any five members may make a written protest, under oath, which must be annexed to the bill, to be considered by the Governor in connection with it. If, however, the bill is signed by the Governor or passed over his veto, any three of the protesting members may within thirty days carry their case into the Supreme Court, and have an immediate enquiry into the facts of the alleged violation. If the court find the facts alleged in the protest to be true, the bill is null and void.

No such provision as this has as yet been tried in the United States, or, if it has, it has not been in force long enough for us to appreciate its effects. It undoubtedly marks the furthest possible limit of restraint which can be imposed on legislative bodies, since it adds to the veto of the Governor that of the courts, and there is no power beyond to which to appeal. It confers a power upon the courts which they have never hitherto had, and in doing this at the same time that it imposes the gravest restraints upon the legislature, it is in the direction of all the recent changes. The great danger of it will of course be that, so far as it makes the courts judges of the elections and returns of the legislature, it tends to involve them in political decisions, which they have always hitherto wisely avoided. On the other hand, in nine-tenths of the cases which arise, the minority's right to protest will be quite enough to prevent the consummation of a fraud, and the supervision by the courts of the "ways and manners" of such bodies as meet at Jefferson City, Albany, or Harrisburg cannot be productive of anything but good. It is a novel experiment, but it is one which seems founded on correct principles, and, to put it in its most extreme form, it seems hardly probable that authority over what may be called the administrative machinery of legislation will be likely to undermine the independence of the courts any more than their authority over legislation as to property and contracts. As we have already said, any authority over questions purely political, such as seems threatened by one or two of the Missouri provisions, would be clearly dangerous.

## BASKET BURIALS.

London, June 28, 1875.

THE Duke of Sutherland is the largest land-owner in Britain. When I tell you that in one county alone—namely, Sutherland—he owns no less than 1,176,343 acres, and in the adjoining county—namely, Ross—his wife owns 149,879 acres, you will have some idea what his influence is likely to be in a country like England, in which the possession of land gives a factitious importance even to the humblest and poorest possessor, such as no amount of stocks and shares and banker's balances can ever give. This great potentate—to his credit be it said—has had the hardihood on various occasions to take a line of his own on social questions, and not unfrequently a line which, but for his rank and wealth, would have brought upon him the odium of his order. He is no politician. Having nothing to get from any party, he does not give to any party. I suppose he would call himself a Liberal, but he would be the last man to ally himself with the Liberal party, and a professional Radical he would probably abhor as profoundly as the keenest Tory. His energies find scope for themselves in practical mechanics and in redressing social and domestic grievances. At one time he interested himself in fire-engines. He would get up at any hour of the night and go any distance to see a good fire and work the hose. At another time he took to driving locomotives, and even now he may be seen in his northern principality working his own steam-engine on his own line of railway. Some years ago he braved the righteous anger of an influential body of men—the domestic servants of the nobility—by insisting that those who were in his service should live upon their wages, and not by an elaborate and finely-adjusted system of robbery and thieving, which they had carried on for generations, upon their employers and their employers' friends. Again he appeared as the champion of the oppressed nobility in a protracted warfare against the extortions of the West-End shopkeepers. This warfare culminated in the establishment of co-operative societies, which have created a revolution in the tradesman life of London. The year before last, having no social birds of prey to war against, he devoted his wealth and influence to bolster up the attenuated hospitalities of the Court when the Shah of Persia was over here; and he did this work most royally. This year he has joined forces with Mr. Seymour Haden, and has commenced what promises to be a not inglorious campaign against a necessary but extortionate body of men—the undertakers. Mr. Seymour Haden is a well-known medical practitioner, and perhaps a better-known artist, being considered the most original and accomplished etcher now alive in Britain. About a year ago cremation was much talked about in this country as the most sensible and wholesome means of getting rid of a necessary evil in civilized communities—the mortal remains of our friends. Mr. Seymour Haden, though a liberal-minded man, is opposed to this innovation on our traditional customs, on the ground that by cremation we rob the earth of what undoubtedly belongs to it after our death—to wit, our bodies. But he is also opposed to the traditional custom of using oak or lead coffins and sealing them hermetically, so as to prevent the natural process of assimilation with the earth from going on; and in a series of able and graphic letters to the *Times* he has combated the present mode of sepulture and the extortions of the undertakers, and has advocated a simple and economical mode of being buried in wicker-baskets. This mode, he maintains, does not impede the process of assimilation with the earth; it costs a mere trifle if reasonably carried out; and it does not shock the sensibility of those who are left to mourn, as the suggestion of cremation cannot fail to do.

The Duke of Sutherland has entered keenly into Mr. Seymour Haden's plan, and, with the warmth of a convert from cremation, he is pushing it with all the energy which of yore he expended upon fire-engines and locomotives and thieving men-servants and extravagant shopkeepers. The nobility and gentry of the metropolis were startled and—in the case of the smaller gentry especially—pleased to receive early last week formal cards of invitation couched in the following terms:

> The Duke of Sutherland
> requests the honor of the company of
>
> .....
>
> *at Stafford House,*
> On Thursday, the 17th, and Saturday, the 19th of June, to see a collection of models of basket and other perishable coffins constructed on the principles advocated by Mr. Seymour Haden.
> Garden entrance. Four to six o'clock.

Of course everybody went—some to see the coffins, some to see who went to see the coffins, some to see Stafford House, not a few to see how a duke looked in his own house among the coffins, and some to please Mr. Seymour Haden. The Park, and Rotten Row, and even Prince's Skating-rink, which during this hot season has especial attractions for Belgravian mothers and their daughters, were deserted for the day, and St. James Park, in the vicinity of Stafford House, was crowded with carriages bustling each other in the anxiety of their occupants not to lose any part of the show. At the "garden entrance," when you got to it, you found a policeman—no exhibition in London can go on without a policeman—and a boy in buttons. The policeman asked for your card of invitation or your visiting-card, and the boy in buttons gave you this programme:

> "Stafford House, Thursday, 17th, and Saturday, 19th June.
> "It is necessary, perhaps, to explain that the models shown are merely suggestive, and that the majority of them do not, as yet, fulfil all the conditions essential to their practical use.
> "1. The Mesche in most of them should be larger than it is, and as open as is consistent with strength and the perfect retention of their contents; which contents, again, should consist of the larger ferns, mosses, lichens, herbs, fragrant shrubs, and any of the coniferæ, willows or evergreens, which are always to be had.
> "2. The Osiers composing the baskets should be light (two thin ones being better than one thick one), and no more solid wood should enter into their construction than is necessary to preserve their form.
> "3. They should be of white or stained willow, without varnish or other preservative covering.

"4. Accompanying each of them should be a narrow leaden band or ribbon, pierced with name and date of death, to be passed round the chest and lower limbs, and through the sides and over the top of the basket: (I.) For retaining the body in its position; (II.) For the subsequent identification of the bones; (III.) For sealing the coffin, as a guarantee that the contents have not been disturbed.

"5. In special cases linings of some imperishable material for a few inches upwards from the bottom will be necessary; and in other cases, such modifications of the ordinary form as may ensure a complete inclusion of the body in wool, charcoal, or other disinfectants. Of these exceptional models No. 3 would seem to be, on the whole, the best for its purpose.

"6. Other materials which are light, strong, perishable, inexpensive, adapted for carriage, and favorable to the dissolution of the body, may do as well, and possibly better, than these wicker baskets. Readiness of carriage and the insurance of resolution being the main objects aimed at, several such materials do, in fact, suggest themselves, and may afterwards come to be employed."

On the terrace of Stafford House there were an assemblage of elderly ladies and gentlemen and an assortment of basket-coffins, and in the gardens of Stafford House there were groups of younger ladies and gentlemen and an assortment of basket-chairs, leading an observer to the conviction that the affairs of life were quite as present to their imaginations as the affairs of death. It perhaps would be an exaggeration to say that the gardens of Stafford House and the basket-coffins for those two afternoons took the place of Prince's Skating-rink as a charmed centre of fashionable flirtation. Yes, it would be an exaggeration, but not a gross one.

As for the show itself at which we were invited to assist, it must be confessed that there was very little of it. There were from a dozen to twenty specimens of wicker-work, most of them shaped like coffins, but not a few like ordinary bassinets for babies. One was circular in form, like a saucer-bath. One lot formed a sort of pyramid of coffins, fitting into each other after the manner of a Chinese puzzle. A label was attached to this, from which it appeared that the pyramid in question was "a model of a nest of coffins as they will be kept in stock, from the smallest to the largest." Two large-sized, simple-looking baskets, suggestive of the washerwoman rather than the undertaker, were labelled, "Forms of coffins for ordinary use," and in clear, firm handwriting these expressive words, "The best are very inexpensive." I saw the cheeks of two professional-looking gentlemen dressed in sombre colors blanch as they read these words, and I also remarked that the Duke of Sutherland seemed to regard these two coffins with especial, almost with paternal, interest; and this interest did not seem damped, but on the contrary rather strengthened, by the blanched cheeks of the professional gentlemen. Here and there a basket ornamented with black or blue and gold was lying about, and seemed to restore the equanimity of the undertakers. Such ornamentation might easily be developed at first into a reasonable and soon into the good old unreasonable expenditure. Two baskets lined with moss received the especial favor of these gentlemen, and even enlisted the sympathetic interest of another class of observers who, rightly or wrongly, were supposed to represent a not unimportant trade or profession in London, who style themselves "artistic florists," a superior class of market gardener or costermonger, who supply West-End houses with plants and flowers for dinner-parties and balls. To the imagination of these gentlemen, an almost boundless expenditure for flowers and herbs for the burials of the future presented itself as they looked down approvingly on the moss-lined coffins. Besides the undertakers and the artist-florists—if the conjectures as to the professions of the gentlemen alluded to were accurate—there were a good many medical and learned men who were genuinely interested in the subject from a scientific point of view. There was also a sprinkling of the real world, and a considerable representation of that section of the community who hang on to the skirts of the real world, and run after any new sensation at this period of the year, from the revival services of your compatriots, Messrs. Moody and Sankey, to the latest exhibition of the twin-headed nightingale.

But so far as this movement has gone, it does not seem to me that the undertakers have very much to fear or the artist-florists very much to expect. Mr. Seymour Haden has no doubt a good case, and he has stated it with ability and taste. He has, moreover, been strengthened by the support given to him by so important a personage as the Duke of Sutherland. But he has strong battalions arrayed against him. Self-interest, the preference of centuries, horror of innovation in any matters affecting the dead, British pride and British snobbishness—all these are hostile to him. If he overcomes the dead-weight of this passive resistance, and persuades the public in these islands to adopt his enlightened views, he will deserve well of his countrymen and countrywomen, both of the present and of succeeding generations.

# Correspondence.

## THE IRISH MEMBERS AND THE COERCION ACT.

To the Editor of The Nation:

Sir: Although I often have occasion to regret the manner in which Irish subjects are treated by your London correspondent, I have not hitherto troubled you by writing on the subject, principally because I am so satisfied that what is right will in the end prevail, that I am apt to pay too little attention to current opinion or individual expressions of opinion upon any question. However, there appears to me so much misconception of Irish affairs—so much that looks like presumption on the inevitable ignorance existing in all countries concerning foreign politics—in a letter entitled "Scotch and Irish Legislation," in your paper of 27th May, that I feel tempted now to address you. I will give the gist of your correspondent's statements with reference to the Irish members, mainly in his own words, and answer the same as far as possible:

1. "That the Irish representatives compare most unfavorably with the Scotch; that 'they could no more settle their measures and resolutions at . . . a caucus of Irish members than they could do so at Donnybrook fair . . .; when, therefore, Irish business comes into the House of Commons, it is as often as not the signal for a free fight all round.'"

It is not reasonable to expect the same union amongst members returned from a country divided in religious belief, as Ireland is, as from Scotland, which is almost united in faith; and Ireland appears to me the only country from which unanimity is demanded as a condition for granting its desires. A few years ago, our representation was indeed in a degraded condition But now, under the ballot, and thanks to increased educational intelligence, the people have largely taken the matter into their own hands, and returned men who really represent them—men who can expect nothing in the way of place or pay from Government, and from whom the people can expect little in the way of assistance to jobs or situations. Debauched for years by fawning place-hunters, the Irish representation has now been, to a large extent, purified. I know of few spectacles in modern history more encouraging than the manner in which the mass of the Irish people have put aside material considerations in the selection of their representatives, and chosen men who represent their higher aspirations. It is my privilege to be acquainted with a large proportion of these representatives. I differ from most of them in religion; I differ from many of them on economic questions and their estimate of the extent to which government can influence the material well-being of our people; I differ from the views many of them take regarding foreign (especially Italian) politics. Doubtless some of them may yet be found wanting, but in the main I am convinced of their honesty and single-mindedness. I am at one with them on the great question of home-rule (so little understood in England and America); I see nothing but what is reasonable in any claims put forward by such of them as are Catholics; and, after an intimate intercourse of years, I am satisfied that the most ultra-Catholic of them mean nothing but what is fair by Protestants. Your correspondent is apparently unaware that our home-rule members have an office in London, that they meet regularly, are amenable to discipline, and adopt a distinct policy under the guidance of recognized leaders. This policy may not be acceptable to the two great British parties, but it is none the less an honest and, in our view, a reasonable policy.

2. "A short bill of five clauses for the amendment and continuation of certain acts for the preservation of the peace in Ireland has been before them in committee, and they have actually consumed no less than nine protracted sittings in the consideration of this little bill. . . . There is no novelty in the bill . . . this wretched little bill."

This "little bill" (unhappily passed) is a bill that has deprived five and a half millions of people of the most dearly-prized political rights—the right to carry arms—the right of habeas corpus. We are deprived of the last right none the less effectually because it has been insidiously managed, not as applying to the whole country at once, but to such portions as the Lord-Lieutenant may desire. There are other provisions in this bill almost equally objectionable, but so insidiously worded and veiled that it would take up too much of your space to expose them. If it was attempted to pass such a bill for any corner of England, we should soon know whether there was any "novelty" about it or not. An overwhelming majority of the Irish people considered this bill unnecessary, uncalled for, and degrading. There was, indeed, one main improvement on former bills, besides some minor ones—the Irish press was no longer to be placed at the mercy of the Executive. It was none the less incumbent on our representatives to oppose it. Were ten sittings too much to devote to the consideration of such a bill? Can there be any more awful and suggestive commentary

upon London legislation for Ireland than the evident expectation in Great Britain that our representatives should permit it to be passed at a canter? They would have been less than men—they would have shown the spirit of the wretched race of place-hunters who so long battened on the political vitals of our country—had they not opposed it by every means in their power.

3. "A minority of an assembly of human beings constituted as the British House of Commons is, can never get its way by irritating and vexatious tactics. . . . Forty-one amendments were threatened. Pressure was put upon those of the home-rulers who were supposed to be amenable to reason, and the threat of forty-one divisions was not carried out."

Factious opposition was possible. Our members could have delayed the House two months; for I understand that, without infringing any rule, they could have forced about 300 divisions. But, well disciplined as they are, they wisely adopted a series of amendments which carried with them a large measure of British support. No pressure was put upon our members. The occasion was too solemn to make them amenable to anything but what they owed to their constituents. They took exactly their own course. The contemplated "irritating and vexatious tactics" existed only in the imagination of your correspondent.

If the Irish members did not propose 41 amendments, they proposed 35, which were all reasonable. Particulars of these amendments, and a statement of the numbers voting on each division, would make this letter too prolix; suffice it to say that this bill, *relating solely to Ireland*, was carried against an average majority of 45·4 Irish members to an average minority of 21·4 Irish members. It was not carried by argument or reason, but by a brute Government majority, rushing in from the dining and smoking rooms and library of the House, at the sound of the division bell, and from the adjoining Club of St. Stephen's on receipt of telegraphic news of the impending divisions.

4. It was, "in the eyes of all but the Irish members, amply discussed on the motion for the first reading."

An average of 48 English and Scotch members voted in favor of the amendments, with the Irish majority, amongst whom we often find the names of T. Burt (Morpeth), C. Cameron (Glasgow), Alderman Carter (Leeds), Joseph Cowen (Newcastle), Sir C. W. Dilke (Chelsea), Sir H. Havelock (Sunderland), F. Herschell (Durham), E. Jenkins (Dundee), Sir W. Lawson (Carlisle), E. A. Leathem (Huddersfield), D. McLaren (Edinburgh), G. Trevelyan (Hawick). Altogether, 160 different British members voted with the Irish majority in the different divisions.

5. "They have got nothing by all this."

In consequence of the bold front shown by our party, they obtained the following alterations in the bill as introduced by Government: 1, That the police should be bound to grant a license to carry arms to any person who can produce a certificate of suitability from two justices of the peace (see Division No. 31); 2, That the police should give in annual public returns of names of persons who applied for licenses, specifying whether the application was refused or granted; 3, That searches for arms should take place only between sunrise and sunset; 4, That search-warrants should not be executed except in the presence of some responsible officer; 5, That cases, under portions of the Act, should be dealt with summarily by magistrates only with the consent of the accused; 6, That imprisonment, in certain cases, should be reduced from six to three months; 7, That prisoners should not be subject to hard labor; 8, That no presentment for compensation to the relatives of a man murdered from agrarian motives should be fiated, unless it could be shown that the people of the district withheld material evidence.

With us the franchise is limited to 223,500 out of a population of 5,400,000, or 1 voter to every 24 of the population—only 1 man in 5 having a vote, while 2 men out of every 5 have votes in Great Britain. If the franchises of the two islands were equalized, the world would be shown still more strikingly than at present the depth and intensity of Irish feeling concerning the Coercion Act.

In conclusion, let me express my conviction that, much as the political dishonesty and looseness prevalent in many departments of government in the United States (as portrayed from week to week in your columns) is to be deplored, it will be found infinitely less demoralizing in the long run—infinitely less repressive in its effect on the political education of the masses—than the present system of governing Ireland by the United Kingdom (clear as it may be from political jobbery) against the clearly expressed wishes of an overwhelming majority of Irish electors.

Very faithfully yours,
ALFRED WEBB.

DUBLIN, June 17, 1875.

## PAUL VERONESE.

TO THE EDITOR OF THE NATION:

SIR: Permit me to correct one or two points in your friendly notice of my communication, published in the Boston *Daily Advertiser* of June 2, on the "Marriage of St. Catharine," by Paul Veronese.

My suggestion about the parallelogram was intended to illustrate a point in chiaroscuro, and not as an "exact mechanical recipe for enjoying Paul Veronese."

By the "student" I meant the person who has some active and true interest in art, who understands that faithful, prolonged, and thoughtful study are requisite to the apprehension of artistic language, but who, in consequence of more or less ill teaching, is not yet capable of appreciating the refined and masterly qualities of execution in the Veronese without some such aid as I suggested. With regard to just characterization of form, I think it is not so true that "some painters find it in one mode of representation and some in another" as that *some perceive and characterize some things and some others.* The greatest painters perceive much—all the heights and depths of their subjects—and they characterize completely. The lesser painters perceive less, and are content with characterizing partially. The greatest painters are always safe guides in expression—the lesser ones may be partially so when you know how to discriminate; but, taken as models without discrimination, they are harmful. It was to point out and illustrate this fact, while a rare opportunity for verification offered, that I wrote briefly on the subject.

CHARLES H. MOORE.

CASTINE, Me., June 23.

## THE WHIGS AND THE CIVIL SERVICE.

TO THE EDITOR OF THE NATION:

SIR: I am and have been for many years an interested reader of your paper, and do not often dissent from the views it advocates. But I cannot help thinking that you are strangely unjust to the old Democratic party and to General Jackson, and by consequence unduly partial to the old Whig party.

In your review of Sargent's 'Reminiscences' you exhibit an instance of this bias. After speaking in terms of just severity of the system of proscription for opinion's sake, which (originating, as *I* say, in the days of the elder Adams; as *you* say, in the days of Jackson) is so bad a feature of American politics, you suggest that "efforts" were "made in 1840 to put an end to this mischievous practice. Probably they would have succeeded but for Mr. Tyler's accession to the Presidency and to the Democratic party."

You mean, of course, in 1841; for Harrison was not President until 4th March, 1841, though elected in 1840. Every one whose memory goes back to those years can recall that the most unqualified *promises* were made by the Whigs "*in* 1840 to put an end to this mischievous practice." But 1841 came, and with it the old story:

> "When the devil was sick, the devil a monk would be;
> When the devil was well, the devil a monk was he."

Every promise made *out* of office was laughed at by the Whigs when *in* office. Mr. Granger was made Postmaster-General at once, and everywhere he displaced every postmaster occupying a place which any Whig wanted. I only allude to him thus particularly (for, in fact, all of his colleagues were his worthy compeers) because the earnest and ruthless course of this official drew from Mr. Clay the admiring exclamation—addressed in March, 1841, I think, to Mr. Thomas Ewing—"G—d! how he nicks 'em!" I will not pause to detail the performances of others; but nothing can be clearer than that the pledges made by the Whigs in 1840 were shamelessly violated in 1841, before the death of General Harrison.

Neither did Mr. Tyler "accede" to the Democratic party in 1841. It is very clear that the matter on which Mr. Tyler separated from some of his party in 1841 was concerning a National Bank, and all candid men must admit that the Virginia Whigs in 1840 declared their hostility to a National Bank. This was acquiesced in then—*i.e.*, before the election—just as the profession of protective-tariff sentiments by Democratic Pennsylvania has always been a venial sin. But when Mr. Tyler, acceding to the Presidency in 1841, remained constant to the professions he had made in 1840, he was denounced as a traitor by those who in the previous year had loudly shouted for "Tippecanoe and Tyler too"—a war-cry which, if it meant anything, meant that the opposition to Van Buren's Administration embraced all the shades of political opinion which characterized the extreme divisions of the country, and that the candidates represented all their diverse opinions.

I strongly sympathize with you in your efforts to reform the civil service. Unless this can be done, all other reform will be nearly hopeless.

But, for Heaven's sake, let us be just. The old Whig party was the party of protection, of bounties, of special legislation, of rag money and irredeemable paper, and, in one word, of loose construction of the Constitution. The old Democratic party was the party of free-trade, specie currency, and strict construction. Both parties fell lamentably short of what they should have done in promoting the purity of the civil service, so that at least the inferior places of that service might be held on the tenure of honesty, capacity, and fidelity to the Constitution. So long as these places are the prize of periodical political contests, politics will be corrupt and corrupting.

I grant that the modern Democratic party is as latitudinarian and as heretical as the old Whig party ever was. In fact, the modern Democratic party contains and embodies the worst sentiments of many of the old Whigs.

Very respectfully, * * *

St. Louis, June 30, 1875.

# Notes.

ROBERT CLARKE & CO.'s Catalogue of Theological and Religious Books, alphabetically arranged by subject and author, fills 80 pages octavo. It includes chiefly the literature (or the editions) of the past twenty-five years.——Macmillan & Co. have in press a work of a class which is growing more and more in favor or in fashion: 'An Account of the Old Streets and Homesteads of England,' with illustrations on wood by Alfred Rimmer, of Chester, and an introduction by Dean Howson.——Poe's 'Raven' has been published in France with an accompanying translation by S. Mallarmé, and original fantastic illustrations by Édouard Manet.——The contention over the art-frauds in Italy has led at last to a libel-suit brought by Mr. P. F. Connelly against Mr. S. W. Healy and the *Touriste*, a sort of organ of the latter gentleman. The newspaper begs the public "to note that we have stood in readiness from first to last, and that neither ourselves nor Mr. Healy have ever asked for an hour's delay. This fact alone demonstrates our sincerity."——We have received from Prof. Ch. Fred. Hartt, at Rio de Janeiro, a monograph on 'Amazonian Tortoise Myths,' some of which the author printed a number of years ago in the *Cornell Era*, as we noticed at the time (*Nation*, Feb. 23, 1871). Prof. Hartt seems fully convinced that the *jabuti*, or tortoise, is by turns the sun and moon of the Tupí mythology. He dedicates his paper to Major Oliver Cromwell James, of Rio, and the reasons he assigns for this compliment show that to Major James not only Mr. Hartt but science is deeply indebted.——From Japan there comes to us a report by Henry S. Munroe, Professor of Geology and Mining in the Imperial College at Tokio, on the 'Gold Fields of Yesso.' The result of the survey was not very encouraging. Tests made by means of the Japanese mode of gold-washing proved it far superior to the Californian "long tom," or short sluice.——No. 27 of Stieler's Hand-Atlas (New York: L. W. Schmidt) has three new plates by Dr. Petermann, of the usual high quality, viz., a South Polar map, with a number of side-maps of the principal islands; the Mediterranean and North Africa west of the 18th meridian E., with side-maps of Malta and Gibraltar; and Southernmost Africa—Cape Colony, the Transvaal Republic, etc., etc.

—The 'Genealogy of the Families of Payne and Gore' is the latest publication of the Prince Society of Boston. It has been compiled by Mr. William H. Whitmore, printed at his own expense, and presented by him to the Society. The record is mainly a transcript of that prepared for family purposes by the descendants of Tobias Payne, including his autobiography; but Mr. Whitmore has from his abundant knowledge added very valuable notes and a partial genealogy of the Gore family, which, in the person of Gov. Christopher Gore, intermarried with the Payne. A heliotype from a painting of this eminent Massachusetts statesman is prefixed to the elegantly-printed volume. Not a few other Boston families of distinction are also inosculated with the Paynes, so that Mr. Whitmore's labors are sure of at least local appreciation. The Prince Society, however, is not local in its membership, though its stronghold is New England, and Massachusetts particularly. This is its sixth publication, and as the Society was founded in 1858 it has certainly been deliberate in its issues. The following list shows that this deliberation has gone hand in hand with sound judgment in selection: (1) Wood's 'New England Prospect,' reprinted from the London edition of 1634, with a preface by Mr. Charles Deane, 1865; (2) 'The Hutchinson Papers,' in two volumes, edited upon the edition of 1769 by Mr. Whitmore and Mr. W. S. Appleton, 1865; (3) John Dunton's 'Letters from New England,' 1686, edited from the original MS. in the Bodleian Library, by Mr. Whitmore, 1867; (4) 'The Andros Tracts,' reprinted from the original editions and MSS., with a memoir by Mr. Whitmore, in three volumes—Vol. I., 1868; Vol. II., 1869; Vol. III., 1874; (5) 'Sir William Alexander and American Colonization,' edited with a memoir by the Rev. Edmund F. Slafter, 1873. A circular of March 30 announces that as many fresh works are in preparation, and that the Council intend to issue at least one volume annually. 'John Wheelwright,' edited by Charles H. Bell, is already in press; the others treat of Capt. John Mason, Sir Ferdinando Gorges, Champlain's Voyages to New France, and Sir Humphrey Gilbert.

—As the Prince Society is the earliest American book club, and indeed the only surviving one if the Bradford and Narraganset Clubs do not form an exception, our readers may be glad to have some account of its constitution. It derives its name from the Rev. Thomas Prince, a native of Sandwich, Mass. (born May 15, 1687, O. S.), who was forty years pastor of the Old South Church in Boston (1718–1758). He collected and left to the church a precious collection of books relating to New England history, which is now deposited by itself in the Boston Public Library. He was also an annalist of New England events from the year 1682, and delivered a great number of sermons on memorable occasions, which are now much prized for the information contained in them. His birthday (May 25) is the time of holding the annual meeting of the Prince Society. The first rule of this association is that it "shall be administered on the mutual principle, and solely in the interest of American history," and its activity is restricted to the publication of one volume a year. Editorial and official work is without compensation, and the price of each volume is fixed at a hundredth part of the cost of the edition. No other assessments are levied on members, and no expense for publishing is incurred without specified contracts on vote of the Council. The selection is among "rare works, in print or manuscript, relating to America." Membership is obtained by a majority vote of the Council, on recommendation of a member. With the economical management indicated by these provisions, it is not surprising to find the Society not merely out of debt, but in pocket by a sum sufficient to meet current printers' bills without calling on members for pay in advance. It prints only what it considers valuable, it divides the expense equally among the associates, it keeps true to its aims; and so long as it can command the disinterested service which it has had from the beginning, there seems to be no reason why it should not prosper indefinitely. Of course a few men take most of the burden on themselves. The names of some have been already mentioned; others, like the late S. G. Drake, Mr. John Ward Dean, Mr. J. Wingate Thornton, and Mr. W. B. Trask, are well known for their devotion to the objects of the Society.

—Many of our readers may be aware that the "Industrial League" of Philadelphia a year or two since sent a circular letter to the colleges of the country, wishing to know what text-books of political economy were used in instruction. We have just received a second circular, in which we are informed that the answers to the first disclosed much dissatisfaction with the text-books in use, and expressed a desire for one "which should fairly discuss the opposing doctrines of protection and free trade," and that Professor Thompson's work (reviewed in our Number 515) "seeks" to accomplish this desire. We are glad to see that the conscience even of this League does not permit it to assert that the work it recommends really does fulfil this desire; and if he had said that it only "seeks" to treat of political economy at all, we fancy its president might have slept more soundly the night after penning his circular. The fact is that all the more important parts of that science are passed over without any adequate consideration, and that many vital ones are not even referred to. The three great divisions of political economy are production, exchange, and distribution. To show how completely the first is ignored, we have only to remark that there is nothing about the growth and function of capital in production at all. The law of supply and demand, the causes of the different rates of remuneration in different employments, the effects of monopoly rights upon price, and the enumeration of the various elements which enter into the price of products, are all of prime importance, yet we cannot find that they are even alluded to. Protection is the burden of the book, and, in the view of the Philadelphia economist, the best way of proving protection to be necessary is to enumerate all the evils which have befallen the human race, and inform the student that they are the result of foreign trade. From an educational point of view, there is a more serious objection to the recommendation of the Industrial League than anything the book teaches or does not teach. At the present time there is nothing more important in the education of the young than teaching them to think clearly and accurately on topics of public interest, and we can hardly conceive of anything more destructive to all clearness of thought than the attempt to digest mentally such a mass of crude speculation and vague assertion as that contained in the work recommended by the League.

—In an incidental allusion the other day to Alexander Campbell, we carelessly spoke of him as the "founder of the 'Christian' denomination." The following correction which has been sent us appears to be worth printing for the general information :

"There are two minor denominations in the United States that are often confounded by those who are not intimately acquainted with them—the 'Christians' and the 'Disciples of Christ.' Alexander Campbell was the founder of the latter, which arose about the year 1828. The Christians arose about the beginning of this century. The local churches of the Disciples very often take the name *Christian*—as 'First Christian,' 'Central Christian,' etc. Also some of their denominational corporations take the same name—as 'Christian Missionary Society.' Hence, for instance, as one of this body, when questioned, might truthfully answer that he belonged to the Central Christian Church, there is often confusion of names, and the denomination is called by the name of a local society. The Disciples are often nicknamed 'Campbellites,' but call themselves 'Reformers' and 'Disciples of Christ' (individual churches often calling themselves *Christian*), though Campbell considered the name *Christian* 'appropriated.' They are inclined in sympathy to the Baptist denomination, from which their founder came forth, having been a Presbyterian before. The Christians are often nicknamed by pronouncing the *i* in the first syllable long, but are never called Campbellites, and never respond to the name Disciples or Reformers. The Christians established Antioch College, of which Horace Mann was President during the latter part of his life, and their sympathy is rather with the Channing wing of the Unitarian body and with Congregationalists. They have no friendship whatever for Alexander Campbell. Indeed, in this case the *odium theologicum* is somewhat intense, the habits of thought of the two bodies not being harmonious."

—A movement is on foot in England to build a memorial theatre to Shakspere in his native town. The immediate occasion of it was the destruction of the old theatre at Stratford-on-Avon by its purchaser, Mr. J. O. Halliwell Phillipps, for the purpose of restoring the site to New Place. The proposed building is to be erected by subscription, and to be made without and within as ornamental as possible, and completely equipped for dramatic representations. A site has been already given for it, and from the grounds about it, which will be laid out as gardens, beautiful views will be obtainable of the river and the church. The capacity of the theatre will be proportioned to the population of the town, but with an arrangement permitting a considerable enlargement of the auditorium on occasion. In connection with it there will be a library and a gallery for pictures and statuary of Shaksperian subjects, of which a number have been promised already. Donors of £100 and upwards will be governors and managers of the property. The subscriptions already amount to some $15,000, ranging from £100 to one guinea. No sum, however small, will be refused, and all English-speaking peoples are invited to share in the memorial. The total amount required is not stated. Contributions may be sent to the Shakspere Memorial Fund at the Old Bank, Stratford-on-Avon, and communications for further particulars should be addressed to the local secretary, Mr. Charles Lowndes. Any surplus over the necessary outlay, and the income from ordinary rental of the theatre, will be applied to the celebration of the poet's birthday and to the promotion of legitimate acting, by means of prizes, and ultimately a training-school or college.

—The London *Times* of June 21 contains an interesting letter from a correspondent in Rome concerning the *Mafia* in Sicily. His information in regard to this secret association is derived from the reports of the prefects of Palermo, Catania, Messina, and other cities, laid before the Italian Chamber by the Minister of the Interior. The *Mafia* is a comparatively new thing, having had its origin apparently in the confusions of 1860. It has reached such a point of influence as to be no longer a mere scandal, but actually to threaten the continuance of civil order and responsible government in a large part of the island, and to compel the Ministry to appeal to the Chamber for a grant of special and exceptional powers to enable them to deal effectively with an institution so threatening to public prosperity and individual security. The prefects agree as to the immense power of the association, the extent of its operations, the solidarity of its members, and the extreme difficulty of ascertaining the precise machinery by which the system is worked, and of tracing home its crimes to their perpetrators. In fact, the *Mafia* is a vast *Ring*, composed of the most unscrupulous and ignorant members of society. The Prefect of Caltanisetta says :

"The *Mafia* may be defined as a speculation made by one upon the cowardice of another with the intention of despoiling him of his substance under threats of death, or to compel him by similar threats to perform whatever action or commission may turn to the profit of the speculators. The first origin of this evil is the abhorrence of work or labor of any kind, and the consequent avidity to obtain the means of living without them. The *Mafioso*, therefore, endeavors by intimidation and fraud to strip his neighbor in order to supply himself. He is influenced by the spirit of imposition and domineering united to that of rapacity and idleness. The *Mafia* is divided into high and low. The low—*bassa Mafia*—is rough and shameless ; any blackguard who feels himself endowed with a little extra courage can go in to be a *Mafioso*. He threatens to kill this person and that, and thus is obeyed and served with the greatest humility ; nor can his victims deny him anything till they are reduced to poverty. The high—*alta Mafia*—makes an ostentation of polished manners, but is at the same time in accord with the bravos and *Mafiosi* of the lower class, by means of whom he carries out his system of intimidation or the execution of his vengeance ; whether to steal with impunity the cattle from the estates surrounding his own, to obtain possession for a miserable price of a piece of land or a property he may covet, or to marry a richly-portioned girl into his family. So much for the country ; in the city or village he works in the same manner to obtain power, to push into some municipal office with the object of robbing the communal treasury, or of turning the means of the commune to his own private account, or even to get rid of some relation whose heir he is. He seeks, as far as he can, to corrupt the magistrates and other functionaries, to deceive them, twist them round his fingers ; and by bestowing his protection he strives to enrich himself and obtain influence and importance."

—The Pope, it appears, has not given up his notion of making a *beato* if not a saint out of Columbus. The *Unità Cattolica* says that the beatification of Columbus was favorably received by a majority of the bishops at the Vatican Council, but "the invasion of Rome having rendered a reunion of the bishops impossible," the cause remains for a time suspended. We have already noticed (*Nation*, Vol. XX., p. 174) the Comte de Lorgues's life of Columbus, and his tract in favor of beatification. He finds a mysterious link between the discoverer of the New World and His Holiness in the fact that Pius IX. is the only pope who ever saw America (in 1823, when he visited Chili). There are two or three St. Columbas, and there seems no good reason why there should not be at least one St. Columbus. He would find not a few companions in discovery and voyaging among the brotherhood, but the old-fashioned saints used to make their voyages with less expense of reason and less cost of patience and of will.

—The past year has been prolific in works relating to Italian history. We have already noticed the admirable monographs on Lucrezia Borgia and Lorenzo de' Medici by Gregorovius and Von Reumont ; but these are excelled in interest and extent by Guio Capponi's splendid history of the Florentine Republic, 'Storia della Republica di Firenza' (two vols. large 8vo ; Florence). There is something singularly appropriate in the history of a state by one whose ancestors rendered it such noble services as did Guio Capponi's, and this work crowns very fittingly a long life of honorable activity in the state and in the world of letters. The author's object was not, he says, to write a learned history of his city, but a popular work—that is, popular in the sense in which the older Florentine histories are popular. He has nevertheless examined minutely the most important authorities, and availed himself of the results of the most recent investigation. His own family archives have contributed much valuable matter, and he has had at his disposal a large amount of inedited material, which enables him to throw new light upon the occurrences of the period from the middle of the XIVth to the end of the XVth centuries. For the early history of the city he follows in the main the chronicles of Malespini and Dino Campagni, and gives in an appendix his reasons for believing them genuine (for the opposite theory see the *Nation*, No. 490). Interspersed through the work are chapters giving, at the close of important periods, a résumé of the state of letters and arts, beginning with Dante and his contemporary writers and artists and ending with the sciences, letters, and arts under the republican government of the Medici. The history ends, of course, with the fall of the commonwealth in 1532 ; but the final chapter contains an admirable sketch of the fate of the city under the Grand Dukes and down to the present day. The style in which it is written is clear and elegant, and for this, as well as for its impartiality and spirit of freedom, it has received abroad the highest praise. We may add that there are already two excellent original English histories of Florence. One of these, Napier's 'Florentine History' (London, 1846–47, six vols.), is too extended for the ordinary reader ; the other, by T. A. Trollope (London, 1865, four vols.), is, in spite of some blemishes of style, an excellent work, not so popular in this country as it should be. It is noteworthy for its outspoken denunciation of Lorenzo de' Medici. One may still be permitted to hope soon to see a complete translation or a careful abridgment of Capponi.

—The amount of protection which authors are nowadays receiving is among the signs of the times. As a refuge against the reviewers, they have a special organ in Germany ; in England they have begun to cut loose from the publishers in the matter of copyright ; and in Spain they have concluded to dispense with publishers altogether, and to forego all risk at the same time. The *Sociedad Bibliografica Peninsular*, of Barcelona, is an association which, as we learn from *Polybiblion*, is designed to assist authors in putting forth their works without resorting to publishers, and without expense of any kind, and without prejudice to literary property. How the society is

originally composed we are not informed, but any author becomes a member of it whose work it accepts for publication. The book is then got out at the society's charge, and 50 per cent. (of the profits apparently) goes to the author and 50 per cent. to the society to meet the cost of its administration, etc. After the third edition the book becomes the author's sole property. Moreover, every member is entitled to a discount of 50 per cent. on all the society's publications. The delicate point is obviously the acceptance of works offered, since this implies rejection; and Spanish authors will be exceptions to the irritable tribe if the adverse decisions of the Council of the *Sociedad Bibliografica* do not provoke denunciation of the enterprise as a close corporation. Nothing more natural, in that case, than to see started a new organization on the principle of the *Antikritiker*, for the purpose of publishing exactly the works rejected by this mutual-admiration clique, whose censorship denotes either ignorance of true merit or personal jealousy, etc., etc. At this stage, however, the author will have to put his hand in his pocket, and it will by-and-by occur to him that he could always secure publication by paying for it, and that on the whole his chances with a hundred more or less uncritical publishers for getting the cost of manufacture assumed are better than with a more or less critical directory of fellow-authors and rival littérateurs.

## BLACKWELL'S 'SEXES IN NATURE.'*

A SINCERE desire for the amelioration of women—for a greater advancement in the same direction in which the progress of civilization has already carried them—ought to have inspired a very different line of argument from what Mrs. Blackwell has seen fit to follow in the principal essay of her book, that "On Sex and Evolution." The practical good sense and skill in accomplishing desirable ends by appropriate means, which is naturally a true feminine superiority, would have dictated a different course. Like too many of the more prominent feminine leaders of the movement, our author seems to aspire to rival, not men in general, but that small faction among them who are called philosophers, and, by showing how a woman may even cope with these, to demonstrate superiority to all the rest. But men of the Anglo-Saxon race are not in the habit of acknowledging the superiority of philosophers. Even Mr. Herbert Spencer, with whom Mrs. Blackwell ventures to dispute on some points, though apparently in her view the type of this kind of superiority, and though the first genuine universologist and omniscientist which the race has at all honored for more than two centuries, has not hit upon lines of argument likely very soon to subdue the masculine prejudices of this race.

Proofs of superiority or inferiority or equality, as general theses, from profound principles and the nature of things, make small impression on the unsubtle Anglo-Saxon mind. Such minds are apt to challenge a question of this sort, to apply the Socratic *elenchus*, and demand first of all what the question really means; as by asking, in respect to the assertion of the abstract attributes of superiority, equality, or inferiority, about *what* these attributes are maintained? Superior in *what* is the male or the female? Or equal in what are they? To attempt after a French or German philosopher's fashion to establish the main unqualified thesis, and then freely deduce from it any desirable consequence, has not yet become the philosophical habit of the unimaginative, slow-minded Anglo-Saxon in respect to any question of science or politics. If Mrs. Blackwell had contented herself with simply challenging the meaningless thesis of masculine superiority as an absolute one, trying to find out what kind was claimed, and why or in what respects superiority is maintained, she would have shown the quality which most of all distinguishes the sound feminine mind of her race. But, unfortunately, she has allowed that the general thesis of masculine superiority has a meaning, and she has attempted to oppose it by what appears to us the equally meaningless thesis of the natural equality of the sexes.

Mr. Darwin, as a naturalist, has enquired in his treatise on 'Selection in Relation to Sex' (without the least conscious approach to any political or sociological sentiment on the subject) into the origin of the most conspicuous differences between closely allied species or races, on the theory of a common descent; namely, those through which it appears, as a very general rule, that the males of closely allied races differ more than the females (differences which are, therefore, to the naturalist the more noticeable and important characters for classification). In doing this, he has, it seems, though it must have been unwittingly, given testimony against the essential equality of the sexes, by "fixing attention, as he does, upon masculine characters only" (p. 59). In thus noticing secondary sexual differences, he seems to Mrs. Blackwell to maintain that there is "no equilibrium of sex." And she adds that "the two leading philosophers of evolution [Darwin and Spencer], each after his own method of investigation, being intent upon explaining the wider equilibrium between organic nature and its external conditions, it becomes fairly credible that they may have failed to give satisfactory attention to the lesser equilibria, of sex, of each individual organism, and of every organic cell." It appears to us very unjust, not only to Mr. Spencer's originality but to his independence, to credit Darwin with any share in the explanations of "equilibria," since the latter has only undertaken with the inferior intelligence of a naturalist to account for diversities in organic nature, without undertaking at all to weigh them in the scales of absolute science. To do this approximately—for she claims no more—with reference to sex, has been left to the deep insight of our author.

We have studied with care Mrs. Blackwell's "Tabular View of Equations in Organic Nature" (p. 55), and we confess ourselves completely baffled by its mathematics. Under insects, fishes, cetacea, birds, herbivora, carnivora, and man, she has set down certain characters for comparison, putting *pluses* and *minuses* against them for both sexes, according as in each character the one sex exceeds or falls short of the other. Thus, for insects, we have comparison of the sexes in "structure" (a rather vague character), "size, color, activity, products, sexual love, and parental love." To these, in the class of fishes, "nurture" is added. And further, "strength" is substituted for color in the order of the cetacea. And still further, in the class of birds, "color" is restored in the place of "strength," and "ornaments" and "pugnacity" are added. Similar lists are given for higher divisions of animals, including man, who has a long list of nineteen characters by which fairly to compare the sexes. The author thinks that by thus "holding the feminine character up beside the others in a balanced view the equilibrium is restored" which Mr. Darwin's partial view of the matter has disturbed!

In drawing up this "table of comparative equations, the *mean* of characters in each class is taken as zero." We are much puzzled to understand what is meant by a "mean of characters," when these are not to be compared in quantity. How much size does Mrs Blackwell suppose to be equal to a given amount of color? Or is it the importance of these to an animal's existence that is thus measured; and does she mean that the characters are so chosen that they are of equal importance to the welfare of the race? Perhaps, however, the solution is (and this may account for the inequality of the number of *plus* and *minus* signs, notwithstanding her final estimate of "sex = sex" throughout nature) that the signs affixed to characters, together with the author's estimate of the comparative importance of them, will foot-up zero. This, however, does not appear from the tables themselves, and must be an estimate by one or the other of the two mental powers which the author sets down in her list for man and counts among feminine superiorities, namely, "direct insight of facts" or "direct insight of relations"; for it is certainly beyond the power of ordinary masculine mathematics.

Such a mode of approaching the practical questions of the coeducation of the sexes and the political and professional qualifications and legal rights of women, is, we venture to believe, rather aside from the usual feminine methods of thought. The soundest intellects, whether feminine or masculine, are not apt to be caught by such meaningless propositions as that of equality between things not at all comparable in quantity, either by themselves or in common influences and effects. That "the male is superior" among the higher animals has, however, a real meaning, independently of the importance of characters in the classifications of natural history, in the common understanding of this elliptical phrase—a meaning which does not refer to any such grounds of comparison as those presented in this book, except where the author has incidentally referred to the quality of "pugnacity" in her lists of characters for birds and mammals. This quality also belongs to certain male fishes and to reptilian males. That the author should have omitted it also from the list of characters for man is remarkable, considering how combative the masculine man is, not only for a cause, but from the love of battle; in how many directions an active competitive disposition urges him; and how his very superiority in reasoning power, which our author allows, is of the nature of belligerency, since arguments are the weapons of the mind. Superiority in the sense of imperiousness, consciousness of the power of victory—a superiority incessantly sought, if not attained, in that *active rivalry* which is a better name than "pugnacity" for this generic masculine quality—is what we believe to be generally referred to in speaking of the male as the superior. It is not a superiority in the number nor in the importance to life of the qualities that distinguish him, nor a superiority in unconscious endowments of nature—which only science could estimate—but only in those issues of conscious activities which kindle masculine ambitions and *active* rivalries most readily, and urge the male to battle and to the ultimate arbitrament of the

* 'The Sexes throughout Nature. By Antoinette Brown Blackwell.' New York: G. P. Putnam's Sons. 1875.

"Laws of Battle," on the basis of which all his more refined and civilized rights and superiorities (like the suffrage) really rest. This, which is the greatest mental difference between the human sexes, is probably not so great, however, between the averages of the two in civilized races as is the range of mental difference in either sex. It nevertheless gives a marked tone in connection with the differences of education and occupation, so that men generally gain with greater readiness through this urgent internal impulse what are commonly but wrongly regarded as natural endowments, the power of abstract reasoning, and that sentiment of justice (through a keener observation of the conditions of effective competition) which are allowed by our author to be among possible masculine superiorities (p. 140). Masculine justice is, however, in itself only the sentiment of fair competitive dealing, and distinguishes the active rivalry of the male from that quarrelsomeness which has by some thinkers been mistaken for it, and which the name "pugnacity" does not exclude. The superiority of conscious victory, for which the male is at least the most ardent candidate, determines to so great a degree the competitive exercises and studies of youths that it would be a great loss to them, however beneficial coeducation may be to the other sex, if its use as an incentive to study were abandoned. The boy declines by a true masculine instinct to compete with the girl, half conscious that he labors under a disadvantage for present display, as he instinctively converts his exercises and acquisitions into a firmer command of powers which are to serve for subsequent trials and more important struggles.

No doubt a sympathetic, mutually-aiding aspiration for excellence is a more refined motive, and, though much less effective, is gradually becoming in the progress of civilization a substitute for the motives of active rivalry which are more distinctive of sex. Many most important interests and pursuits have lost in this progress their association with the overshadowing category of sex, the former extent of which even to inanimate objects is indicated by the grammatical genders of the languages which barbarians have transmitted to us. To further this progress, the best thinkers have contended for the *irrelevancy* of sex to much that is still traditionally associated with it, and for the rights and duties of adult human *individuals* independently of sex. The absurd metaphysical, unqualified thesis of the equality of the sexes, for which this book contends, is, even with the Spencerian calculus of evolution, a barren argument, quite beyond the comprehension of the masculine arithmetic of justice. Our author adds to the passage we have quoted above on "equilibria" of sex, organism, and cell, that "if these are not each moving points of simpler adjustments within wider and wider systems of more complex adjustments, then I fail utterly to comprehend the first principle of organization." We fail to comprehend it even if these "equilibria" *are* what is thus defined. Such a discussion of a practical question has to us the appearance of a wretched affectation of profundity, rather than of a real interest in the advancement of women.

## RECENT POETRY.*

IT appears from a notice at the close of the 'Undivine Comedy' that Mrs. Cook "did not live to oversee the issuing of the work" on which she had bestowed disinterested labor and unusual pains. Her translations bear the mark of her interest in the peculiar literature of Poland, and of considerable literary skill in rendering into English compositions remote not alone in form, but also in spirit, from the usual modes of English thought. If we are to believe the testimony of the author's compatriots who have written of his works, and whose essays Mrs. Walker translated to serve as the introduction to his poems, his writings exercised, and still exercise, a remarkable influence upon his people. In this respect they are interesting. They serve as a measure, however imperfect, of the intellectual culture and moral ideals of the Poles. But we suspect that something too much is ascribed to them in attributing to them great effect in determining the course of Polish action and in maintaining the ardent emotions which have underlain the Polish struggles for independence. However this may be, the impression left upon the reader of the translation of the 'Undivine Comedy' is not so much of the healthy power of mature and cultured genius as of the morbid energy of faculties untrained by actual experience of events, and of an intelligence that mistook spasm for passion, mysticism for profundity, and aspiration for rational effort. If such works as those of Count Krasinsky have really exercised much influence in Poland, it is but a proof the more of the retrograde condition of the people in civilization and of the prevalence of semi-barbaric modes of feeling and of thought. The volume may be commended to all who would acquire some acquaintance with the stage of mental development at which the Poles have arrived.

Mr. Morris's poems would, if they appeared for the first time to-day, seem anachronistic, and would not give strong evidence of a new and genuine poetical gift. In other words, Mr. Morris has had the success or the ill-success, as it may be, of, if not founding a school, at least giving motive and impulse to a number of followers. There is a certain literary interest in now reading these poems under the light thrown on them by Mr. Morris's later and better-known productions; and those readers who have found delight in the 'Earthly Paradise' may be pleased to note the marked progress of the poet, and yet to observe how fairly his later excellence was foretokened in his youthful performances. That Mr. Morris deserves a place among the English poets will hardly be contested, and whatever abatements the admirers of his special gifts allow in deference to the conservative critic, they will not find themselves compelled to admit that any English poet since Spenser has had a truer genius for romantic narration, or that any story-teller has interwoven in his narrative with less injury to its firm texture the subtle threads of modern sentiment and individual emotion. In this first volume of his poems Mr. Morris shows himself an artist in a double sense not less than in his maturer works; and indeed it is plain that in his earlier work the painter is contending with the poet for the mastery of his genius. Every page is a picture, often one of which the meaning is unnecessarily obscure (a trait of boyishness), and not only a picture in light and shade, but in color as well. Opening at random, we find on three successive pages a "golden twilight," a "gold lady," a "golden moon," "golden hair," a "golden hall," and "gilded courtiers," and on the same pages we have "poppies red," and "pure green grass," and a "crimson banner," and a "crimson thing," and "green leaves," and "yellow hair." Here is the exuberance of youth, which Mr. Morris has learned to chasten. In these earlier poems we find, as in the poet's late work, the sense of the perplexity and sadness of life, of the utter dismalness of death, of the misery of confused passion, and of the perfect glory and joy of complete, unquestioning, and passionate love. If, in the mediæval garb in which the feeling embodied in these early poems somewhat stiffly clothed itself, a little of affectation and apparent insincerity should seem to betray itself, we have only to recall Mr. Morris's more recent work to understand that this appearance was due not to the lack of real feeling, but rather to his artistic inexperience of the real moods of life and his ignorance of his own genius.

Why "H. H.," who once seemed to have a natural gift for the expression of personal sentiment, should have thought it worth while to versify the affecting story which had been told so well and so recently in prose by Mrs. Leonowens, is not accounted for by any peculiar merit in her verse. She has succeeded, indeed, in taking the story out of the region of terrible reality and setting it in a cloudland of sentimentality from which tragedy is banished.

The verses in the pretty little volume called the 'Fountain Inn' are very innocent, school-girlish productions, and, if the writer or her friends take pleasure in seeing them in print, we have not the least inclination to diminish it.

'Point-Lace and Diamonds' is a daintily-printed volume of *vers de société*. There is some sparkle in these rhymes, but it is the effervescence of a sweet champagne; it smacks of the late supper, and warns of a headache the next morning. The "society" of which these verses are the outcome is not that which poets frequent. The volume does not charm the reader with the suggestions it affords of the style of the maidens and lovers of New York; but it is too light to serve as a text for moralizing.

Another volume of verse of more serious quality is called 'Miscellaneous Poems.' It bears no author's name on the title-page, but the poems are plainly the work of a woman. They are rather the expression of a sensitive than of a highly poetic temperament, and seem better fitted to give pleasure to the author's intimate friends, interested in her personal experiences of sentiment and emotion, than to claim attention from the indifferent public. The tone of the verses is pure and refined, and they give evidence of strong religious feeling.

*Constantinople.* From the French of Théophile Gautier. By Robert Howe Gould, M.A. (New York: Henry Holt & Co. 1875.)—We had occasion, some months ago, on the appearance of the translation of Théophile Gautier's 'Russia,' to express our opinion as to the wisdom of depriving this extraordinary descriptive genius of the benefit of his own tongue. Gautier is above all a man of style, and one has no right to divest him of his own style without giving him another in exchange. The 'Winter in Russia' seemed to us carefully and not unskilfully translated, but the gentleman who has undertaken to do the present work into English has had a very imperfect idea of his responsibilities. To translate Gautier in the off-hand fashion in which you would transfer from one language to another the gist of a newspaper paragraph strikes us as a literary misdemeanor of the first magnitude, and yet of no less an offence has Mr. Robert Howe Gould, M.A., been guilty. 'Constantinople' is, next after the 'Voyage en Espagne,' its author's masterpiece, and to translate it with perfect verbal felicity would not have been easy. But to translate it with care, zeal, and respect was the least to be required of one who should put his hand to the task. Mr. Gould should, in the first place, have notified his readers that what he was giving them was an abbreviated and mutilated edition of the original. Omission in translation is rarely absolutely unjustifiable; but some intimation should always be given of the extent to which the privilege has been used. Mr. Gould uses it freely and constantly—indeed, we may say that whenever a passage is at all difficult to render he leaves it out. Many passages, it is true, were better left out than rendered as baldly and flatly as Mr. Gould renders them. His infelicities swarm even in the opening pages of the book. The great point with Gautier was to use at any hazard what he calls the *mot propre*—to make an image. When he speaks of the country round Marseilles as "ces beaux rochers couleur de liége et de pain grillé"—the "color of cork and of toast"—Mr. Gould insipidly renders it "rocks of rich brown." This is indeed not only insipid, but false, inasmuch as it was obviously the idea of dry and arid brown that the author wished to convey. When he says that at Malta "il fait véritablement clair"—"it is really light"—the best that Mr. Gould can do is to say the "atmosphere is really clear." When the author uses so special and picturesque a phrase as the sea being "gaufré de moires par la brise," Mr. Gould translates vulgarly, "broken into ripples." Mr. Gould always gives the vague epithet instead of the special one. "Un bloc de rochers fauves, fendillés de sécheresse, calcinés de chaleur," is a vivid picture: "a mass of rocks, tawny, consumed by drought, burned by heat," is relatively none. Why shuffle away the admirably expressive term *fendillé*—split into chinks, cracked, chapped? Why in the next page interpolate bodily a threadbare line from Byron which does not exist in the original? In the chapter on the Golden Horn there is an admirable passage about certain old houses—"ces bonnes vieilles murailles empâtées, égratignées, lépreuses, chancies, moisies, affritées, que la truelle de Decamps maçonne avec tant de bonheur dans ses tableaux d'Orient, et qui donnent un si haut ragoût aux masures." This is Gautier at his best, but as to render the passage requires some little ingenuity, the translator quietly drops it out. A still finer passage, a description of a dervish, is worth quoting, with Mr. Gould's version of it: "Je n'oublierai jamais ce masque court, camard, élargi, qui semblait l'être écrasé sous la pression d'une main puissante, comme ces grotesques de caoutchouc qu'on fait changer d'expression en appuyant le pouce dessus; de grosses lèvres bleuâtres, épaisses comme celles d'un nègre; des yeux de crapaud, ronds, fixes, saillants; un nez sans cartilage, une barbe courte, crêpe et frisée, un teint de cuir fauve, glacé de tons rances et plus culotté que ton qu'un Espagnolet. . . ." What Mr. Gould offers us instead of this is: "His whole aspect and the mould of his features were among the most remarkable, as well as the most hideous, that I have ever beheld." Even for a single word the translator will not brighten his wit a little. If a casket of jewels is scattered "dans un désordre chatoyant," for Mr. Gould it is merely a "picturesque disorder." We have encountered those inexcusable shortcomings in a very rapid examination of the volume. It is evident that a vast number more may be found. The work, in short, has been translated by a person totally destitute of appreciation of his author, and in whose hands its essential merit, its vividness, its incisiveness, its gaiety, have evaporated. No one reads Gautier for information; we read him for the vivacity of his phrase, for his imagery. If you suppress this, you deliberately suffocate him. It is to be hoped that if it is intended to offer a translation of the 'Voyage en Espagne,' the services of some other literary artist than Mr. Gould will be obtained. A good translation might be made by a person who would give care, and taste, and imagination to it; but to subject the work to the process which has spoiled this unfortunate 'Constantinople' would be simply cruel.

*Storms:* their Nature, Classification, and Laws, with the Means of Predicting them by their Embodiments in the Clouds. By William Blasius. (Philadelphia: Porter & Coates. 1875.)—We do not recollect when we have seen a book of so much pretension as this one which contained such a heterogeneous conglomerate of valuable and valueless. Many facts are described with more lucid simplicity than ever before, and there are not wanting important criticisms upon received methods and assumptions of weather observers, which would make us recommend the book, if it did not also abound in shallow special pleading, exhibiting ignorance of the laws of physics. The analysis of the tornado in West Cambridge, Mass., in 1851, to which the first chapter and the appendices are mainly devoted, gives the clearest arrangement of the phenomena which we have read, though the author's assumed explanation of the cause could, if it were worth while, easily be shown to be impossible. Electricity is entirely ignored as a factor in this and other storms, in spite of proofs (which are included in Mr. Blasius's citations) that it was the chief agent. He even ridicules such agency. "Nature requires no convective discharge of electricity; no complication of *unknown* forces to produce the phenomena of a tornado"—whereas, instead of being unknown, the effect of a magnet upon iron-filings is a perfect parallel to the movements occurring in the tornado described. He uses the old terms polar and equatorial in speaking of horizontal currents, where he merely means cold and warm; and theorizes just as if a wind could blow 1,000 miles to destroy a thermic gradient of only 5°, which it could do provided there were no such thing as friction, an obstacle which he conveniently ignores. He assumes that these two so-called polar and equatorial currents are in everlasting collision, just as if a weakness were a force, for an ascending warm current is a weakness, crowded aside by the denser current, and possessing no motive-power of its own apart from that very crowding, with which therefore it cannot collide as if it were independent of it. This untenable hypothesis, he says, in his second line, "it is the object of this volume to *promulgate*"—a frank confession that he is not an investigator but a partisan. He carries his partisanship so far as to assert that Hildebrandsson, when stating that storms in Sweden travelled from the north, mistook north for south or else made isolated observations (!); whereas, according to the clear principles laid down by Clement Ley, storms in Sweden ought to travel from the north.

In treating of vertical currents Mr. Blasius reasons more sensibly, but he entirely fails to conceive that an "equatorial" current when raised to a high elevation would *instantly* lose its heat as soon as its clouds were gone. The only good feature of the hypothetical portions of the book is its steady recognition of slanting currents, but its attempt to supplant the rotary theory is a failure. That theory needs to be limited to the more central portion of areas of low pressure, for experience shows that the air blows toward, rather than around, their outer portions. And Ballot's law needs to be confined to areas of low pressure, for the wind diverges in all directions from areas of high pressure (if these be narrowly bounded). The author attempts to increase the nomenclature of clouds by adding a new name—conus. We never saw half-a-dozen clouds shaped like a cone, and we object to the introducing of any more non-descriptive names. Not to censure without proposing something better, we would suggest that the simplest nomenclature would be one based upon the shapes of clouds as determined by electricity. Thus, clouds without electricity are *flat* (stratus). As electricity enters into moisture the vapor begins to assume a rounder form (cumulo-stratus); when fully charged with electricity a cloud is *globular* in form; if the electricity be discharged leaving some of the vapor behind, this vapor begins to scatter, losing its compact form and looking woolly. These *fleecy* clouds are commonly called cumulus, though the name scud is quite as good, and the name cumulus might better be reserved for the globular electric clouds.

The worthless character of the reasonings in the book as a whole can best be shown by a few illustrations. On p. 21 Mr. Blasius assumes that the collision of a S.W. and a N.W. current would produce a *calm* at their equilibrium (instead of a W. wind). On p. 115 he assumes that at this calm place the air would be "compressed," while everywhere else he speaks of this conflict as the source of low pressure and ascension. On p. 151 he speaks of the trade-winds as "encircling the whole globe," while elsewhere he had allowed that over extensive tracts of both sea and land they did not blow. On p. 138 he assumes that in the southern hemisphere storms will travel from E. to W.; has he ever looked at any records south of lat. 25° S.? On p. 67 occur some remarkable mistakes in the latitude of the zones. On p. 44, in quoting from a French letter, he translates "est" *west*. On p. 22 he exposes his juvenile ignorance of the laws of chance by assuring us that "I repaired during the same autumn and the succeeding year to

Prospect Hill" (the scene of the tornado analyzed) "as often as I saw indications in the clouds of the approach of another tornado."

The following criticism upon the Government system is not without pertinence:

"The Signal Service observations fail to manifest the peculiarities of storms, because they are made only three or four times in the course of 24 hours. The region of low barometer . . . . frequently does not remain in the same position for five minutes at a time, and it is impossible to observe its changes of position and the great contrasts north and south of it . . . . by only three or four daily observations, or even eight, as was agreed by the late Meteorological Congress at Vienna. . . . It is like a zoölogist who, desiring to study different kinds of fishes so large as to require separate observations of their parts, goes to the stream at seven o'clock in the morning and takes notes of the head of the first fish that passes him. He then goes away, and returning at noon punctually notes the tail of a fish swimming off, which is all he sees; in the evening he comes again, and notes the middle of fish number one, which this time is swimming past in the opposite direction. Putting together the three parts he has noted, he constructs a fish; but what kind? Yet this is the method pursued in meteorology, and we can expect to arrive at no better results . . . . by averaging observations made at fixed hours without reference to the changing character of the phenomena observed."

*William Sharp*, Engraver. With a descriptive catalogue of his works. By W. S. Baker. (Philadelphia: Gebbie & Barrie. 1875. Sm. 8vo, pp. 121.)—This little volume contains a fairly well written and intelligent memoir of Sharp, and what seems to be a comprehensive and thorough catalogue of his works. A heliotype copy of his engraving of his own portrait is prefixed to it. We cannot but wish that Mr. Baker had done such honor to the old engraver as to employ one of our engravers to reproduce this portrait on the diminished scale required, instead of allowing the inartistic process of sun-engraving to give us a reproduction that would have excited Sharp's bitter indignation. Sharp was a true artist, and at his best an admirable engraver. His work in portraiture in the maturity of his power may stand comparison with the best, not only in fineness and firmness of technical execution, but in the subtle rendering of character through exquisite draughtmanship, and in thorough appreciation of the limits of his art and its relations to nature and to painting. His engraving of Reynolds's portrait of John Hunter is in its way as good as the original, and is likely long to outlast it. To all collectors of good engravings of the English school this catalogue will be indispensable. We wish that Mr. Baker might give us equally careful monographs of other noted engravers.

*NEW YORK, THURSDAY, JULY 22, 1875.*

## The Week.

PROFESSOR MARSH has published the evidence on which his charges against Mr. Saville, the Indian agent at Red Cloud, rest. In the first place, he says that from what he saw of the agent on the spot, he knows him to be incompetent, weak, and vacillating, and unfit for the place; that he had defrauded the Indians by withholding from them provisions charged against the Government, as, for example, on November 8, 1874, when, according to his accounts, there were issued to 12,351 Indians 271,248 pounds of beef, but in reality there were none issued at all; that J. D. Bevier, Indian Inspector, on October 21, 1874, exposed and laid before the Interior Department a fraudulent contract of Saville with his father-in-law, A. R. Appleton; that the number of 12,351 Indians returned by Saville on November 8 was false, as he (Professor Marsh) found by personal examination; that according to an affidavit of one Louis Richard or Reshaw (whose character, he says, is vouched for by General Bradley), the issue of blankets on November 12, 1874, was fraudulent as to quantity and bad in quality; that the beef contract was in the hands of one Bosler, notorious for frauds in former contracts, and for this reason "excluded by the published regulations from any participation in future contracts." Besides this, he gives a certificate of General Bradley, Captain Mix, and Lieutenant Hay as to the "wretched" quality of the rations and the under size and puny condition of beef examined on the 11th of November, 1874, and a certificate of Captain Burt of the Ninth Infantry, dated June 12 of this year, to the following effect:

"I certify that I was present last fall at Red Cloud Agency when Professor O. C. Marsh was there; that we together went to the corral to see an issue of cattle to the Indians; that the cattle we saw at that time were Texas cattle in miserable condition, some of them so weak the Indians could not goad them out of a walk. The cattle were as a rule small in size."

This is only a small part of the evidence, which relates also to pork, flour, sugar, coffee, and tobacco. Professor Marsh addresses his pamphlet to the President, and declines laying it before the Interior Department alone—1st, because he has no confidence whatever in the sincerity of either Mr. Delano or Mr. Smith, they having "long been aware of the abuses," and made no real attempt to reform them; 2d, because he has been convinced in his interviews with these officials that their main object is to prevent publicity, and suppress the facts; 3d, because the evidence in his possession reflects unfavorably on both Secretary Delano and Commissioner Smith. This their best friends will not deny. Under these circumstances, following the practice usual in such cases at Washington, Messrs. Delano and Smith have proceeded to appoint a court to investigate themselves, and the latter has issued a copy of instructions for the court's guidance, the gist of which is that Mr. Marsh is a rather hasty philanthropist, whose charges are vague and indefinite, but, nevertheless, ought to be looked into. This commission is now organized, and Professor Marsh is going on with his work. He has undertaken a very thankless task, having against him the whole force of the Indian "machine," with all the money involved in the Indian contract system, and on his side only a strong sense of duty. A venal press, however, is to be counted on his side, and we very much fear that it will take a great deal of evidence to break the force of the statements made by Professor Marsh and backed by four officers of the army. We must beg to call the attention of several of our correspondents, who wrote to us some time ago remonstrating against any attacks on Mr. Smith, to his present position. He may be a good and pious man, and Prof. Marsh may be mistaken in saying that he makes fraudulent contracts, keeps bad men in office, and tells lies; but his friends ought not to leave him alone now. Some of their certificates to his goodness would be of more value to him now than at any previous time in his life. In his letter to the investigating commission, Mr. Smith states a truth which, in these days, it is always important to bear in mind. He tells the commission that they "will undoubtedly meet with persons of strong partisan feelings enlisted both for and against the administration of the present agent"; and, "as they proceed," they "will become fully aware of the misrepresentations which such partisanship naturally produces," and also of "the extreme difficulty of discovering the truth amid the conflicting statements and allegations." This is a strong position, and looks as if Mr. Smith had learned advisers.

The Cotton-States Congress has managed to add itself to the tolerably long list of public and semi-public bodies who do not know exactly what they wish done with the currency. An inflation resolution was adopted by the Congress on Wednesday, but on Thursday was reconsidered and put over for another year. Besides this, the Congress adopted a resolution demanding national aid for Southern railroads, and another advising the formation of State agricultural bureaus. There is very little inflation news besides this, except that Senator Thurman has been explaining his position as a hard-money man in supporting the Ohio Democratic platform. This explanation is the old story: the inflation plank in Ohio is a "local" affair, and has nothing to do with national politics, and, therefore, as Mr. Thurman thinks that the contractionists can carry the National Convention, he does not care how Ohio goes on this question, and feels bound to support the ticket and consign the Radicals to eternal ruin. The Cincinnati *Commercial* thinks that so much disgust has been inspired by the performances of the Convention that the Republicans will carry the State.

The crops have come into prominent notice during the week, and there has been a large advance in the price of breadstuffs. It is known that there will be more than an average product of cereals in this country, and further that a large part of last year's product has been held back because of the low prices which have until recently prevailed. With this state of facts, there was but one thing which could cause a sustained advance, and that was an extraordinary foreign demand. This has already come, and its continuance is probable. In every part of Europe the weather for the past three weeks has been unfavorable to the degree of threatening disaster. It is known that positive disaster has befallen a large part of France, and that other parts of it have been visited with such heavy rains as to have beaten down beyond recovery the grain, which was in the latest stage of maturity. A large part of the wheat bought here in the past two weeks has been for French account and use. North Germany and England have also suffered from heavy rains. But the chief injury has fallen on the Black Sea provinces of Russia, which more than any section compete in the grain markets with the United States. Excessive heat and swarms of locusts have, according to the latest advices, nearly if not quite ruined the spring and winter wheat. Extreme heat has also injured the wheat crop of Southern Hungary. Of course, speculators have not been slow to take advantage of this condition of affairs, and prices in this country have undoubtedly been carried up higher and faster than they would have been had the market been left to respond only to natural influences. As might have been expected, Chicago speculators have run ahead of all others, and the rise in prices there has been from three to five cents a bushel

for wheat more than here. As to cotton—a much more important staple so far as the foreign trade is concerned—the reports continue very promising, and "authorities" do not hesitate to predict a crop of 4,500,000 bales. These predictions may and probably will be modified, but if the crop is no more than 4,000,000 bales it will be good enough, particularly so far as the South is concerned, for that section will probably raise this year more grain than it will consume—something which it has never done before.

---

The importance of good crops may be magnified, but the danger of late has been that it would be underrated, on the ground that because we have had fairly good crops since the panic, and there has not been that recovery in the business condition of the country which was expected, it therefore makes very little difference whether the crops are large or small. Everything which the earth produces, whether it grows or is dug out, is an addition to the wealth of the country; the bartering or exchanging of this wealth may be impeded, but sooner or later its possession and accruing advantages cannot fail to be felt. For a great part of the time since the panic, those who possessed goods or property have not known that those who wished to buy would or could pay, and this want of confidence, which has from time to time been increased by suspensions in unexpected quarters, has had more to do with the dulness which has prevailed than has generally been believed. Besides, the medium by which exchanges are made has been suspected, and will always be so until it is convertible at will into gold. This last drawback is, however, the only one which has not been diminishing in force each day since the culmination of the panic. All others bid fair to obstruct recovery less than in preceding seasons; so that there is good reason for expecting much improvement in the trade of the autumn on which we are now entering. The rise in grain has quickened freights, and the railroads report a larger business, although the trunk lines are not expected to show much gain until after the close of navigation. There has been a rise in railroad securities at the Stock Exchange, buyers having discriminated in favor of roads which will first feel the impetus of the new business. During the week there has been a further decline in gold, because of the extreme ease of the London money market, which is beginning to be felt here, through the increased demand for American securities. The unusually heavy exports of grain have also had their due effect. The specie export for the week was $1,962,221, making the total for the year $57,122,832. The syndicate are selling new fives in Europe more rapidly than ever before, and during the week Mr. Bristow has accordingly been able to call in $10,000,000 more of the five-twenty six per cents.

---

The jury in the suit against Niles G. Parker, ex-Treasurer of South Carolina, have rendered a verdict for the State in the sum of $75,000. This is just a third of the amount alleged to have been abstracted from the treasury by Parker, but, as the evidence was mainly circumstantial and very complicated, the jury thought it safest to go no further than they could see; and one witness, Ladd, a former clerk under Parker, having testified that the latter had shown him from his private safe $150,000 of coupons (worth fifty cents on the dollar), and had consulted him about funding them secretly, they were able with a good conscience to agree that the State had been robbed of $75,000. Parker was so confident of acquittal that he offered no evidence in his own defence. He probably relied a good deal on the composition of the jury, which consisted of seven blacks and five whites, described as being, with one or two exceptions, "as ignorant a set of men as could well be picked out," and his conviction must certainly be regarded as accidental. He had procured the disappearance of the two most important witnesses that could be produced against him—namely, Ladd, and one Owens who had funded the stolen coupons as his agent. Ladd, however, was caught and made to tell what he knew, and fortunately he was able to bring into court a letter of Parker's, dated June 2, 1874, in which the ex-Treasurer showed himself anxious to fund his coupons without exposing himself, and ended with the admonition—"You need not keep this letter, but destroy it." Ladd also testified that Parker had admitted to him having received $450,000 of coupons in the settlement with Kimpton, which had been divided as follows: Gov. Scott, $50,000; Neagle, $50,000; Kimpton and himself, $150,000 each. The remaining $50,000 had been "set aside" for Attorney-General Chamberlain. While nobody doubts that the $450,000 came into Parker's hands, we have only his word that he had confederates in this particular act of plunder. The parties implicated have denied all knowledge of the coupon transaction, and it is much more likely that Parker put the whole amount to his own use and profit; at all events, he rejected his opportunity to prove the contrary, though, if he desires it, he may have another chance in the criminal proceedings which are impending. The nature of the fraud in which he has been detected cannot be explained briefly, but what he did was to keep uncancelled the paid conversion-bonds coupons returned to him by the New York agent, transfer them to his own pocket, and put in their place as vouchers coupons which had matured on bonds while still in possession of the State—for example, when hypothecated as collateral for loans to bolster up the credit of the State.

---

The attack made by Mr. O'Conor and Judge Davis on the Court of Appeals can hardly be treated with levity, for the charge made against the Court is substantially a charge of fraud. Mr. O'Conor says that the Court, in its opinion in Tweed's case, relied upon an argument of his own which they had before expressly overruled. We do not propose at the present time to go into the merits of the decision, but there are some facts bearing upon the reputation of the Court which it may be as well to recall. When, some few years ago, the old Court of Appeals was broken up and the new one formed, a strong movement developed itself to reform the judiciary by abandoning the elective system. The friends of the elective system carried the day, notwithstanding the frightful warning given by the examples of Barnard, Cardozo, and McCunn, and an examination of the vote showed that the rural parts of the State were really those which had prevented the change, the country population having apparently come to the conclusion that the system "worked well," and that their own judges were good enough for all practical purposes. Now (we regret very much to say it, but the evidence on which the statement rests is public property, and accessible to everybody) there are some peculiar figures relating to the election of one or two of the judges of the present Court who were chosen in Tweed's time, which it is difficult to explain on any other theory than that they are fraudulent. But this is not all, for a very wily, shrewd, and cautious politician, who would hardly have ventured so far had he not good grounds for it, has declared in print the explanation of the figures to be, that one judge was actually "counted in" as the result of a combination between the Ring in the city and the Canal politicians.

---

The Chief-Justice, too, is a noted politician, who is generally "up" for some office or other, sometimes the governorship and sometimes the Presidency, and whose name of course becomes the foot-ball of any newspaper that wishes to kick it about. Three years ago he was covered with ridicule because of his alliance with the Greeley movement; and within six months he has appeared in the newspapers abusing one of the counsel engaged in these very Ring suits, and undertaking to explain that certain newspaper attacks on himself were inspired by this lawyer, whose motives the Chief-Justice also analyzed with minute care and opprobrious epithets. We do not at all impugn the honesty of the Chief-Justice; but the known facts of his position, and his strong consequent political appetite, cause him to be added to the list of suspected judges. What is the result? The Court

decides a series of rather complicated cases in favor of a man who was a few years ago the source of that political power to which some of the judges owe their seats. The chief counsel in the Ring cases publishes a manifesto, in which he says almost in so many words that the Court is corrupt, and reminds the judges that by impeachment even guilty courts may be got rid of. The publication of this letter—a letter such as few men in the world would have dared write—necessarily recalls to the mind of everybody such facts as to the history of the Court as those which we have given. These are not conclusive, but they are damaging. Reformers will admit that this is a lamentable result of that purification of the bench which took place eleven years ago. But there is nothing unnatural or surprising in it. It is what every one who saw the reform stop short with the destruction of Barnard, Cardozo, and McCunn, and fail in its attempts upon the system which produced them, must have foreseen would follow. The country statesmen who have kept the elective system alive will, we trust, not overlook the mire into which the Court of Appeals has got itself, and will, when in a communicative mood, let their city brethren know whether they on the whole think that the interests of justice and decency are advanced by the system which produces such results.

---

The question which has been agitating Massachusetts for some time with regard to the execution of the "boy-fiend" Pomeroy has had new light thrown upon it during the past week. The theory of the opponents of the execution has been that the boy was an exception to all rules, that his low intelligence prevented his having any knowledge of the atrocity of his own crimes, and therefore it would serve no good end to hang him. Therefore, let us save him, educate him, and make him a good and worthy citizen. Pomeroy has, however, now given abundant proof that his intelligence or cunning is not by any means of a low order, by publishing a long statement, in the Beecher-Tilton manner, going over the "case" from the beginning, and proving by various means that whoever did the mutilating and murdering, he had nothing to do with it. This statement is an artful and cleverly-constructed document, and shows that Pomeroy, of whose guilt there is not a shadow of doubt, would be rather a difficult subject to save and educate. There are a good many criminals in the world whom there is no particular object in saving, and the philanthropists who are trying to do away with capital punishment ought not to forget that the general sense of danger in the community, arising from the feeling that crimes go unpunished, leads in the long run to a determination on the part of the better classes of society to have blood for blood; and this in turn leads to much greater inhumanity and injustice than a well-regulated gallows.

---

The College races and the remarkable shooting at Wimbledon have given the past week rather an athletic than an intellectual character. It must be said, however, that a great part of the exultation over both events is due to moral causes. When we go back to the time of the contest between Heenan and Sayers, and think of the disgraceful scenes to which it led, and then consider the bad blood caused by the Oxford and Harvard race, the rifle-shooting becomes remarkable not merely as a proof of great skill, but as a proof of increased ability on the part of all branches of the Anglo-Saxon race to conduct sports fairly and decently. We may say the same of the Saratoga race, where for three days there were sports of all kinds between a great number of colleges, conducted, some of them, in a new and complicated way, yet conducted, as we have always boasted we conduct our sports, with the honest determination that the best man shall win. It has been for some years now, in this country at least, an open question whether athletic sports would be carried on and improved and perfected, or whether they would fall a prey to the general love of money and be "captured" by the horde of swindlers and "professionals" who live on them. It seems pretty clear that some of the best of them will be saved from this fate.

---

What the exact nature of the new government of the Samoan Islands is, and whether we ought to "hail" an addition to the area of freedom, or mourn over another land upon which the blight of tyranny has fallen, we do not know. The powers of Mr. Steinberger have not been published, but inasmuch as they seem to have included the election of a chief-magistrate of some sort for four years—nothing is said as to the number of terms to which he is entitled—and the selection of himself as premier for life, they must have been extensive. Whence he derived them is unknown too; but the accounts of him that come from the Pacific coast, where he is said to have spent with a lavish hand "the income he derived through some undiscovered channel from the United States Treasury," are not altogether favorable. He had a Government sloop-of-war with him, we believe, and will no doubt soon set the Samoans progressing at a tremendous rate. As everything in connection with these islands is now interesting, we may recall the fact, which seems to have been overlooked, that they have a religious interest attaching to them, as was pointed out by Captain Wakeman in 1872, when urging upon the Government the necessity of a treaty. The native women, Captain Wakeman then declared, "stand out in all their beatific nudity and loveliness, the emblem of the great Master's handiwork in his happiest mood, a combination of beauty, grace, and innocence which no Christian can look upon without the deepest sentiments of love and admiration, both toward the Creator and the created." At that time, it was understood that a treaty had been negotiated between the Samoan chiefs and the United States by the manager of an Australian line of steamers, one of the clauses of which was: "We do acknowledge the absolute authority of the United States of America with regard to all matters whatever, and bind ourselves to adopt the common laws of America"—perhaps the most thoroughgoing proof of a sincere desire for reform ever given by a simple, savage race.

---

The foreign news of the week has been unimportant. The floods on the Garonne have been followed by serious but less disastrous overflows in Wales and England. In the shooting at Wimbledon, individual members of the American Team have fully maintained their prestige for marksmanship and have carried off several prizes. On the Continent, the chief political event is the passage of the Public Powers Bill by the French Assembly, the votes for it being 530. This occurred on Friday, and a vote looking to an adjournment this week till November was carried by a small majority. The debate which followed the annulling of the election of M. Bourgoing in the Department of the Nièvre was very heated. M. Rouher denied the Assembly's right to annul an election on mere documentary evidence, and endeavored in vain to persuade it to break the law and to order a new election. He maintained the right of the Bonapartists to cherish hopes of gaining possession of the Government, as the Legitimists and Orleanists were doing, and of defending the character of their late sovereign, as these factions had done after previous revolutions. This brought down upon him some passionate denunciations (in which Gambetta was conspicuous) as an abettor in the *coup d'état;* but he was firmly met by Ministers Buffet and Dufaure. Buffet said the Government would guard itself against the attacks of revolutionists and Bonapartists, and would keep a special eye on the former, as being, in its opinion, the more dangerous of the two. M. Dufaure said it would not take its eye off the Bonapartists either. Gambetta thereupon attempted to make some capital out of the difference of views between the two ministers, and ended by charging the administration with the support of the Bonapartists. M. Buffet affirmed the rightfulness of its policy in retaining in office loyal functionaries who had served under the Empire, and the debate closed with the Bonapartists in good humor, and Gambetta with an uncomfortable sense of having overshot the mark, while the Government had lost neither strength nor dignity.

## CLASS MORALS AND GOVERNMENT MORALS.

THE demand of the Southern Commercial Convention for Government railroads across the Appalachian Mountains shows that the Cotton States are experiencing somewhat the same difficulty in finding out what ails them that the Western States have been experiencing, and the remedy they propose for their troubles has somewhat the same origin. In criticising the Western desire for fresh issues of greenbacks and for the provision of transportation by the United States Treasury, we are apt to forget the great difference between the political traditions of the East and the West. In the original thirteen States these traditions run back to a period, not very remote, when the State furnished all the government there was, and when the General Government was not in existence. They recall, too, very vividly the fact that the General Government was a creation of the States, in a time of great difficulty and danger, and that they watched over its beginnings with much patience and self-restraint and anxiety. The habit of expecting help or encouragement from it has therefore never taken root on the Eastern seaboard. Even the war has not sufficed to create it. The Federal power has never had hitherto, and has not now, the air of a providence on which the people ought to rely for extrication from their difficulties. Mr. Boutwell tried hard at the last to seduce the commercial world into this way of looking at the Congress and the Administration by his mode of using the public funds, but he did not succeed. He stimulated speculation, and perhaps now and then saved a speculator from ruin, but he did not create a habit of mind. On the whole, and considering the temptations of the last fifteen years, the healthy condition of the Eastern mind is rather remarkable. Neither of the two great political delusions of our own day—the desirableness of inflating the currency and of having railroads built at the Government expense—has really taken much hold of the people in this part of the world.

The traditions of the Western States with regard to the General Government are of a very different character. As far back as the records of the oldest of them goes, the United States was not only in existence, but occupied towards them the position of a ruler and patron. It supplied the earliest protection of their people against the Indians, and the earliest police and administration of justice. It supplied the very territory out of which the State was made, and the earliest public improvements, and the earliest means of regular communication with the civilized world. It is not wonderful, then, if a strong belief in its capacity and resources, and in its paternal character, should have lingered in the political traditions of the new States, and should stay there in spite of the growth of State pride and of much preaching of State rights. Nothing is more natural, when one comes to analyze the matter, than that the Western farmer, who finds that he has settled too far from the market, should begin to cry, and ask the United States to scare away the naughty speculators, and make him a nice new road of his own, on which he could have his corn and hogs carried for as little as he pleased; or that, when he finds that he is short of money, he should call on Uncle Sam to print him some nice new greenbacks, which the wicked foreigners could not or would not take away from him.

One of the greatest benefits likely to be derived from the New York Canal Investigation—indeed, we think *the* greatest—will lie in the lesson it will afford of the danger of Government attempts in a country like this to play the part of a providence. There was, doubtless, a great deal to be said for the construction of the canals at the public expense at a period when the accumulations of private capital were unequal to a task of such magnitude; in fact, the result has shown that it was a piece of sound policy. But it has shown also that the attempt to administer them as a commercial enterprise through State machinery was a great political mistake. The corruption they have bred is now so deeply rooted, and has so thoroughly permeated our society, that we believe the gentlemen engaged in the enquiry on Governor Tilden's Commission are puzzled about a remedy. Some of the abuses have acquired so much strength, and have so blunted the moral sense of the population along the banks of the canals, as to have acquired in their eyes the character of vested interests, of which it would now be unjust to deprive them. In countries in which there is a bureaucracy, with its own discipline, traditions, and standards of honor, like the civil service in Prussia, for instance, and like the regular army among us, it is often possible for the state to carry on great enterprises more honestly and economically than private individuals or corporations could do it; that is to say, by taking plenty of time and using peculiar means and appliances, and under favorable circumstances, you may sometimes create a body of men for the service of the state with morals rather above the average morals of the community at large. But we have no such body except the officers of the regular army, and we have almost made it a matter of policy not to create one. In fact, we have gone further. By offering a smaller quantity of the great social prizes—money and security—as a reward for exertion in the public service than the same kind and amount of labor would bring outside of it, we have lowered the standard of honesty and capacity in that service below that of the community at large, and have thus made it likely that Government work will be done worse than the work of corporations and individuals; that, for instance, Government canals or railroads will be worse administered than similar enterprises carried on by private citizens.

This fact alone, with which everybody is familiar, ought to render the clamor for Government transportation very ridiculous, particularly when it comes from persons who are disgusted with the inefficiency and dishonesty of the present administration of railroad property. There is no reason whatever for supposing that Government railroads or canals would be better than private ones; there are many reasons for supposing that they would be worse. And in judging the present much-abused railroad men, it ought to be remembered, but seldom is, that, as a general rule, not only the government of a country, but the conduct of its great industrial enterprises which are dependent on the general public for support, will represent with more or less accuracy the condition of the popular morals and manners. We pointed out some months ago, in commenting on the suggestion of Mr. C. F. Adams, jr., that the bad manners of railroad officials had doubtless much to do with the popular hostility to the railroads, that the manners of the railroad officers were those of the community in which they lived. They were uncivil in their demeanor because their neighbors and friends were so. In like manner, it may be said with perfect confidence that the morals of the railroad manager are about on a par with those of the Honest Farmer who denounces them so fiercely. If he speculates, jobs, deceives, lies, and repudiates, and considers his own interest more than that of the public, it is because the Farmer would do exactly the same thing in his place, and does do similar things in his own small sphere. It is very rare indeed for officials to stay dishonest under a thoroughly pure and healthy public opinion. No railroad managers could long run a corrupt line through an innocent, unselfish, and God-fearing people. Whenever we hear of the tricks and dodges of which the Farmer is a victim at the hands of the wicked directors and stockholders, we always feel sure that the Farmer himself is by no means above reproach, and that he, too, is probably doing as much in the same field as his more limited opportunities will allow. We doubt, for instance, if the whole history of railroading in this country contains anything more indefensible than the repudiation of public debts which the good Farmer has conceived and successfully carried out in various States. This Southern convention which calls for Government railroads actually recommends a swindle in the same breath, by calling on the Government to repudiate its solemn pledge to the public creditors that the customs duties should be collected in coin and the interest on the public debt paid in the same currency.

The fact is, it is useless and foolish to try to single out any one class of the community as deserving of special reprobation. "We are," as they say over in Brooklyn, "all members one of another." Every large class possesses about the average honesty. If Satan

were going about in search of railroad operators, the Farmer would be very injudicious indeed if he too did not keep out of sight. Whenever "waterers of stock" are called up for judgment, the knees of repudiators of State and county bonds, and those of dishonest agricultural legislators, will undoubtedly shake violently. One of the advantages or disadvantages of the general equality of conditions is that morality, like water, tends to find its level. Whatever stock of it we may have tends to diffuse itself equally over the whole social plane. Nobody can very long keep stored up a much larger supply than his friends and acquaintances, and the importance of remembering this with regard to Government officials cannot be overrated. The notion that the Departments at Washington have moral machinery at their command capable of producing purer and more edifying transportation than Vanderbilt and Scott, is a melancholy hallucination.

## SPAIN AND FRANCE.

A COMMISSION is busy at work drawing up a new constitution for Spain, and it is said that as soon as it is ready the Cortes will be convened and another attempt made at regular government. As the situation of the country has in no respect improved since the accession of Alfonso, and as we see no reason for believing that the new constitution will last any longer than those which have preceded it, there is not much use in discussing its provisions. They will doubtless be adhered to as long as the executive at Madrid finds it convenient to do so, but no longer; and how long that will be it would be hard to say. There has been no material change in the military situation at the north. The Carlists have, on the whole, had the best of the late encounters, and they have, by some means, managed to become possessed of a little artillery, which they use with considerable effect, though they are now said, for the twentieth time, to be hard pressed. The war on neither side is carried on with any pretence of strategy. Neither Alfonsists nor Carlists appear to have a plan of operations. The collisions between the opposing forces seem to be either the result of accident or of pure love of fighting for its own sake. In fact, the conflict resembles the wars of the old Spaniards with the Moors rather than a modern military enterprise, with distinct aims, and a fair prospect of a near termination. The Carlists now and then suffer reverses, but they are never severe enough, and are never followed up closely enough, to dishearten or ruin them, and then they keep the field at much less cost and with much better morale than their opponents. The men are volunteers, who are fighting on their own soil, and who really believe in Don Carlos and in his cause as that of God, while the royal troops are conscripts from various parts of Spain, who take little or no interest in the struggle, and, like most Spaniards of the south, are a little doubtful about everything. So that, although the war may terminate at any moment, there is no apparent reason why it should not go on for five years.

The political combinations and contrivances at Madrid have no real connection with the movements of feeling or opinion through the country at large, and are therefore not worth examination, except as the devices of a parcel of schemers and adventurers who are very short of money, and would like in some way to make their future more sure and at the same time fill the treasury. In fact, it is very doubtful whether all Spanish constitutions are not now drawn up and adopted simply with the view of imposing on foreign money-lenders or raising the price of the national securities. The facility with which the imaginations of creditors may be favorably impressed is now well known to all the impecunious states, and there is a whole series of expedients to which they resort with the view of spreading the impression that they are going to turn over a new leaf. Sometimes they offer to "fund their coupons," which is considered tantamount to saying that the regrettable defaults which have hitherto taken place are now to cease; at others, they found a national bank which is to take charge of the Government accounts, which is considered tantamount to saying that "order will now be infused into the finances"; at others, they put in a new minister, and give out that he is a very different man from his predecessor and will be guilty of none of the old tricks; and at others, again, they offer to pledge something as collateral the value of which depends wholly on their good faith, such as the customs duties. In Spain, the adoption of a new constitution has been found, on the whole, more effective than anything else for imposing on foreigners. If it provides a limited monarchy, with a house of peers, it fills the English bondholder with hope and admiration; if it sets up a republic, it leads the people in the United States to fancy that a better day has at last dawned on the Old World.

Nothing that has occurred in Spain thus far, however, does anything to lessen the probability that a final settlement of her troubles is still far off. The disease from which she is suffering is the same as that from which France is suffering, though in a much less aggravated form, viz., the absence of institutions, or, in other words, of political habits embodied in laws—for laws which are not the expression of political habits do not form institutions; a fact which the people who think states can be saved by new constitutions constantly forget. Habits, however, only grow under the influence of time and of a certain fixity of circumstances. If something exists in a country long enough for people to get used to it and fond of it, or begin to feel the need of it, it contributes to a greater or less extent to the establishment of a regular government, and contributes more than all the debates of all the conventions that ever met. All our own constitutions, Federal and State, owe their strength and durability, not to any originality or deep thinking on the part of the framers, but to the fact that they simply give legal shape to certain customs and ideas already rooted in the soil. There never would have been, for instance, and would not now be, any virtue or value in the habeas corpus, if a horror of detention without trial, or on an arbitrary warrant, had not from time out of memory had firm hold of the Anglo-Saxon mind. What has saved France from anarchy during her repeated revolutions, and, one may say, saved her from the fate of Spain, is that her administrative machinery survived the overthrow of the monarchy, and has become a social necessity. The people will not do without the gendarme, and the prefect, and a disciplined army, but, having these, they care little about the changes of régime in Paris; and the problem over which French politicians have been laboring for the last fifty years, is the establishment of some form of government that will last long enough for the people to become attached to it—that is to say, that will last long enough to become a national custom and to make its overthrow felt as a national calamity.

The Spanish problem is substantially the same, but France has certain advantages in trying to solve it of which Spain knows nothing. One is an army which respects itself, which has great traditions, and which would be mortified by protracted disorder or civil war on French soil, and which considers itself the guardian of the national honor, and eschews politics so far as to obey all orders emanating from the *de-facto* government; another is a well-disciplined civil service, which in like manner feels all impulses from the central source of authority, and does actually execute the laws, by levying the taxes, arresting criminals, and enforcing the conscription. Consequently, revolution in Paris does not involve social disorganization in the provinces. Spain has none of these things, and the political regeneration of the country is, therefore, a much more serious matter, and one with which the form of the Government has little to do. It is safe to say that *any* Government which could now be set up at Madrid, and which could make itself rigidly obeyed for twenty or thirty years, would be a good one, and this is the test we must apply when asking the question whether the Alfonsist monarchy is likely to succeed. What it calls itself, or what it promises, or what it puts into the constitution, is a comparatively unimportant matter, as our eloquent friend Señor Castelar now knows to his cost. If Alfonso is able to stay on the throne, and able to issue even ukases which every man from the Pyrenees to Gibraltar will obey, and will feel sure that every other man will have to obey, he will be as good a

Government as Spain need desire; for a ukase which everybody heeds is, as a mere means of civilization, worth twenty volumes of parliamentary statutes which but few heed.

When we ask ourselves the question, however, whether he is likely to do this, we find ourselves almost as much puzzled as if called upon to predict the length of his life. He is still too young to be judged with any approach to accuracy, and the influences which determine the fate of any Spanish government are too varied to enable anybody to do more than guess as to the duration or character of his reign. There is no public opinion in Spain to be sounded, either in Madrid or in the provinces; and if there were, it would have little to say about the course of things in the capital as long as the army remains what it is. A revolution may any day be wrought by a single regiment, and a government may stay on the throne in spite of the grossest misconduct and corruption or incompetency. In other words, there are no competent judges of Spanish politics. Nobody knows Spain well enough to say what is likely to happen. All that the most competent observer can say is what the writers of travels in Spain and of reminiscences of Spanish life constantly do say—that the Spaniards have very good manners and many fine traits of character, that the women are often handsome, and that public affairs are in a very bad way. The rôle in Christendom played by the country at present is that of a solemn warning not only against priestcraft and absolutism, but against the separation between the customs of a country and its legislation. Law has force and government has solidity only in so far as they rest on the average man's sense of fitness, and on his confidence that legislation is but an exponent of the generally received ideas, and will be generally obeyed as such. If this had been believed without actual experiment, we should have been spared, during the last century, an enormous amount of human misery as well as of windy rhetoric and misdirected zeal.

## THE UNIVERSITY RACE.

SARATOGA, July 15, 1875.

ON the evening of Tuesday there were not wanting men of experience in Saratoga who were quite confident the race would never come off. There were many reasons for this opinion. In the first place, there was the wind, which was certain to get up; and, in the second place, there were the "lanes," a system invented for this occasion, preposterous in itself, and sure to lead to accidents. *A priori*, the argument about the "lanes" seemed convincing. Imagine a course three miles long and a quarter of a mile wide studded with some three hundred little buoys, marked by flags of every color of the rainbow, and a good many colors that no rainbow could reveal, and some of which were very difficult to distinguish at a distance. Imagine, in the second place, thirteen boats placed on this course, a hundred feet apart, rowing at the top of their speed, and each one guided by a particular line of colored flags, to be singled out by the bow-oar from a dense mass of colors growing more and more confused and numerous with each eighth of a mile. How natural it would be for bow to get a diagonal line instead of a straight one, and find himself pulling into a "lane" not his own too late to stop. These arguments appeared to me convincing until I heard those on the other side, which were that the Freshmen crews had been over the ground that very day and found no trouble in keeping to their lanes. To this it might be replied, somewhat inconsequently, that as they were only Freshmen it did not make much difference what they had done. But the beauty of arguments about a race is that they are inexhaustible; and they are almost as good, too, after the race is over as before, inasmuch as if they are justified by the event they may be triumphantly repeated, and, if they are falsified, this is almost always found to be due to some exceptional circumstances which leave the principle untouched. That there would be no race—that there would be the finest race ever seen—that the "lane" system was a great American invention, and that it was a Saratoga swindle—that the Saratoga Rowing Association was another name for John Morrissey, and that John Morrissey has nothing whatever to do with the Saratoga Rowing Association—that Yale would be the best boat on the lake, and that Yale would be beaten all to pieces by Harvard—firmly persuaded of these things we, twenty-five thousand or so knowing fellows that we are, go to bed.

In the morning, the first thing to be done is to get a vehicle of some kind to be taken to the lake, four miles away; and to the credit of Morrissey or the Saratoga Rowing Association or the civic authorities, there was no sort of trouble about this. For $3 it was perfectly easy to get a carriage holding three besides the driver, with a pair of very good horses, and I heard of nothing above $12 being paid for any description of four-seated conveyance. Last year people were made to pay as much as $40 for these four miles. Arrived at the lake, the first thing is to make an examination of the Press Stand, which is almost directly opposite the line of buoys that mark the end of the third mile.

In a race like that rowed yesterday (which, in some important particulars, was unlike any boat-race ever rowed in England or America) the finish is necessarily the great point of interest. On the old plan of a mile and a half out and a mile and a half back again, this was not so. There were three moments of excruciating interest—the start, the finish, and the turn. The grand stand was opposite both the start and the finish, while, the turning-stake being only a mile and a half away, there were apt to be soon after the turn pretty clear indications, except in a very close race, as to the leading boat. Under the system pursued at Saratoga, the grand stand being opposite the finish, the extremely interesting and pretty spectacle of the start is lost, and the turn at the middle of the course is left out. The raising of a flag conveys to the public the fact that the boats are off, and after that the only means of getting the position of the boats is by signalling. An ingenious contrivance to effect this was put up on the Press Stand. It consisted of two rows of numbers, one representing the measured distances, the half-mile, the mile, and so on, the other the numbers of the boats as they were placed in line in the start, Cornell's number, for instance, being 2, Harvard's 12, and so on. These numbers are each painted on one side of a white square, and at the beginning of the race these squares are down, *i. e.*, show only their blank sides. Each one of them has, however, a string attached, by which a man stationed below can pull it up and make the other side show. This he is to do at each half-mile. Supposing that, when the boats have gone over half a mile of the course, the figure ½ shows itself on a white square, and at the same time, on the other row, the figure 10, followed by the figures 12 and 2, appears, this would indicate that at the half-mile Yale was ahead, followed by Harvard and again by Cornell—an arrangement which, the day before the race, would have seemed to most of those at Saratoga eminently natural. If at the mile the squares (which had, of course, meanwhile been dropped) were pulled so as to show the figures 12, 10, 2, this would have indicated that Harvard had passed Yale and was now the leading boat. The course had been so completely buoyed at intervals of an eighth of an mile that there seemed no reason why we should not have in these squares a perfect transcript of the race as it was actually going on. But for some reason or other it did not work perfectly, and the spectator did not get more than a vague impression that Cornell was beating the race. At the finish I doubt if three men on the Press Stand could have told which was the second boat. This, to be sure, was in some measure due to the remarkable evenness of the race, the leading boats being separated only by very short intervals.

We pass half-an-hour in wandering up and down in front of our twenty-five thousand friends. It is already time for the boats to start, but there is a little ripple on the water which looks badly, and as the hour between eleven and twelve wears on, the temper of the crowd becomes despondent. At twelve we go back to the Press Stand. There is evidently some cause for delay at the other end of the course. The flag-man who is to signal the start is fumbling about the ropes very nervously. A gigantic, broad-shouldered, and very dangerous-looking man, who does not look much like a journalist, or a referee, or a judge, or, for that matter, like a professor of religion, is seated on a board at the edge of the lake, giving very hoarse advice to the man with the flag. An imitator of Boyton is paddling about in the water smoking a cigar, enclosed in an apparatus the thought of getting into which would, one would think, almost paralyze the instinct of self-preservation. The sun begins to grow very hot, and the crowd rather dissatisfied.

Suddenly, the nervous man with the flag becomes more nervous still, and begins to pull at it violently, one or two inexperienced representatives of the press begin to make unnecessary and probably unintelligible notes, the dangerous-looking man with the hoarse voice marks the time. A thrill runs through the crowd. They have started at exactly 11.55, and everybody knows that in about seventeen minutes they will be here. The boats of course are nowhere to be seen, and everybody's eyes are turned up to the white squares. It gives a curious sensation, quite unlike that of an old-fashioned start, to find yourselves looking up in the air at these mysterious signals, now so blank and unintelligent, but which seem to have in their own keeping the fate of the race. It is like watching the turn of a card or the revolution of a wheel in a game of chance. There are no boats,

there are no men, nothing but the wide expanse of water, the shining sunlight, and these pitiless squares, with twenty thousand people staring at them. The half-mile is passed, and No. 2 is ahead. If I placed much reliance on the signalling which took place after this, I could give you a very fine specimen of picturesque description, in which, by a little artful touch here and there, the numbers become metamorphosed into boats with living, breathing men—men with hearts, etc., etc. ; but I forbear, chiefly because the signalling was now and then "wild," the numbers rather confusing and difficult to recollect, and the information given by them scanty. To know that Cornell is ahead of Harvard, for instance, is not worth much, unless you know how far ahead, and how the crews are pulling.

Suddenly, almost before you know it, the distant sunlight is alive with boats, a line of twelve, all abreast, growing larger and plainer every moment. While you are still guessing whether the signals are to be relied on, you become suddenly aware that the boats have actually entered the last eighth of a mile, and while you are trying to make out the color of the first, half of them are across the line, and a tremendous volume of sound is rising on every side to welcome the victors. The race is over. We know all about it. The time of Cornell given us by our faithful time-keeper is 16.46¾, the second boat is Harvard, and the third Yale. To be sure this is all wrong ; for the judges made the time 16.53¼, and the second boat was Columbia, and the third Harvard. The race was, so far as the leading boats were concerned, so close as to make it almost impossible at first to get accurate information. Morrissey gave me the time as 16.46¾, which he thought was right, if he got the start right. The discrepancy between his time and the judges' may be accounted for by a mistake made by "George," who helped his chief with the time, but whom I had no opportunity of "interviewing." The time made in the race shows the steady improvement which each year makes in college rowing. One does not need to go back more than a few years to recall the day when anything under nineteen was considered good time, and when anything under eighteen was undreamt of. This, to be sure, was in the day of turning stakes ; but, allowing the traditional thirty seconds for the turn, there is still a margin to be accounted for only by improvement in rowing and improvement in boats. The wind, of course, on such a lake as that of Saratoga may make a great difference, and what wind there was on Wednesday was directly behind the boats. Probably no such time could have been made with the wind ahead or on the beam.

The day before the race the crews of Harvard and Yale had an important consultation, and agreed to recommend their colleges to withdraw from the present organization and return to the old races between Harvard and Yale. These crews have no power except to advise, but their advice must carry great weight with both colleges, and there are some reasons which, not only to them but the public, may seem to make it desirable. There is no connection between the race of this year and the change ; for the matter was determined on Tuesday, for the express purpose of avoiding any misconception. The two colleges, or rather these two crews, have come to the conclusion that owing to the great distance, the difficulty as to quarters, the danger of accidents—a wind, so long as it blows, utterly preventing any race—Saratoga is an objectionable place ; besides which, the admission of a large number of crews swamps the older colleges. This is undoubtedly true. A course a quarter of a mile in width, with thirteen boats, is on so gigantic a scale that the interest, instead of increasing, is rather diminished. The mind is not fixed upon two boats, but wanders over the thirteen in an aimless way. The races that have taken place of late years have been rather surprises than a trial of skill between two pretty evenly matched antagonists whose boating history is well known to every one present. When Columbia beat last year, it was a surprise. Cornell's victory this year was a surprise, not so great to be sure as that of the "Aggies" two or three years ago, but something like it. Then it is impossible to see the race. The finish itself is rather a spectacle than a clearly understood finish. And if you have thirteen boats, why should you not have twenty-five, and the race of the future be a centrifugal race, the boats starting from the center of a circle having a radius of three miles and pulling to the circumference ?

Then besides this, is Saratoga a proper place for the youth of the country to assemble *en masse* at ? Action and reaction are always equal, and therefore it may be very natural that as European Governments have just decided upon closing their Homburgs, we should just be opening ours. But is it necessary that we should send all our children and younger brothers to our Homburg to get their first glimpse of life across a faro-table ? Gambling at Saratoga is just as much a part of the life of the place as drinking the waters. Morrissey's establishment is called a "club," and a club it is, except that the membership is indeterminate, and the play lower as a general thing than in some other clubs. Here in the evening come the male population of Saratoga (parties, I am told, are made up for the ladies in the morning) and stake their money on the red or white. A policeman guards the door ; grey-bearded, venerable men, who are obviously deacons at other times, though here they act as croupiers, rake up the "chips" ; there is a restaurant where you pay for what you buy ; there are our young friends of seventeen and eighteen gambling away their little sums of money. The whole thing is as respectable as possible, and yet, is it a good place for a race? To this question the partisan of Saratoga would reply that it is. You cannot, he would say, break up betting at races, nor preliminary gambling, unless you break up races themselves, and the question is whether the necessary surroundings of a race shall be respectable or not. Formerly, at the old races between Harvard and Yale, there was a regular riot afterwards ; on one well-known occasion a procession was formed in the town of Worcester, which went through the town breaking all the glass windows with billiard-cues. Was there anything like this at Saratoga ? It must be confessed there was not. Never has there been seen a more orderly, quiet, well-behaved set of men than the collegians of this year. Not a single disgraceful thing has been done ; not a single accusation of fraud has been made ; not a claim of foul ; no bad language, no rioting, no disorder. Not only this, but every one of the first six crews is contented, for they all made excellent time, and each one of them that did not beat is satisfied that its defeat, though of course primarily due to having come in after other boats had got over the line, was really ultimately caused by an unforeseen accident, never likely to occur again. Let us moralize at some other time, and admit that the first "lane" race in America was a wonderful success.

## COMPULSORY EDUCATION IN ENGLAND.

London, June 19, 1875.

SOME ten years ago a friend of mine, who was at that time employed as an assistant commissioner to some education commission, consulted me upon the question of compulsory education. We were uneducated at that time in the matter of interference by law with individual freedom. During the decade that has passed since then we have become accustomed to the newer dispensation, and we can listen with equanimity, if not with enthusiasm, to any scheme, however wild, in the direction of interference. Interference by means of an army of inspectors or some such agency is the radical panacea for most social or political disorders. My friend, however, was one of those brave men who lived before Agamemnon, and he was opposed to any proposal which would involve direct interference by law between parent and child. From what he had gathered in his enquiries throughout the rural districts, he considered that compulsory education was impracticable in England ; that there was no real demand for it from any quarter except from the schoolmasters who wished to fill their schools, and from the political doctrinaires who wished to carry out their crotchets ; and that, even if it were honestly demanded, he did not see how any machinery for enforcing it could be devised. He was a man of intelligence and liberal sentiments, and he convinced me that the question was full of serious difficulties. I advised him, however, not to dogmatize in his report upon the subject, but to balance the arguments for and against compulsion, and to leave the decision of the question to the commissioners, his superiors. He followed my advice, and the commissioners adopted a similar respectful policy. They shirked the question, and left the decision to Parliament ; and Parliament, when it passed the Education Act of 1869, shirked the question also, and threw the responsibility of deciding upon every parish and every borough in the country. By that Act, the most illogical of all principles—that, namely, of "Permissive Compulsion"—was established. School-boards were permitted to be set up in any parish or borough where they were required, and these school-boards, when they were set up, were permitted to pass by-laws under which compulsory education might be enforced. Thus two distinct processes were put in train, but as both of them were permissive, there has been no inconsiderable difficulty and some inconsistency in carrying them out to completion. Parish A may have been fortunate, or the reverse, in having one or two energetic Dissenters living within its precincts, who saw the means of inflicting an indirect blow upon the Church through its schools, and these gentlemen may have gone about and roused enough enthusiasm in the parish to secure a school-board ; and this school-board may have been sufficiently enlightened, or the reverse, to pass a series of by-laws to enforce attendance at school within the jurisdiction of the school-board. Parish B, on the other hand, separated from Parish A by a hedge or a ditch, or possibly not separated by any tangible or visible boundary, may have been unencumbered by a single Dissenter. A series of vigorous vicars may have—to use the stereotyped language of the rural

clergy of the Church of England when speaking of their brother Christians who do not conform—"broken the neck of Dissent" and "stamped the Nonconformists out." Parish B, therefore, has no school-board, and, having no school-board, and perhaps no school, it has no by-laws to enforce attendance at school. You have, therefore, this anomalous state of things in rural England: on one side of a hedge you have a district in which every child must go to school on the penalty to his parents of a fine or imprisonment; on the other side of the hedge no child in the district is required to enter a school-door. And, so far as the law is concerned, every child living in that district may be employed from one year's end to the other earning money for his parents in the adjoining parish on the other side of the hedge where children of his own age are prohibited from earning a penny until they can read, write, and count. I do not say whether the parishioners of A or those of B are likely to turn out the most useful members of society in the long run. That is not the question. Hodge, the agricultural laborer, living on twelve or fifteen shillings a week, is not a being who looks to the long run. He wants food for himself and his wife and the younger children, and he does not see the justice of being compelled to withdraw his elder children from field-work in order to send them to school, while Prodgers, in the adjoining parish, being free to do what he likes with his own, sends the young Prodgers to do the work and earn the money that the young Hodges are compelled to give up.

The extent to which this anomalous state of matters prevails can be seen only by referring to statistics. There are in England and Wales 225 municipal boroughs, and school-boards have been set up in 114, or about 50 per cent., of these boroughs. There are also 14,082 civil parishes, and school-boards have been set up in 1,479, or about 10 per cent., of these civil parishes. In 85 per cent. of the boroughs in which school-boards have been set up, by-laws enforcing attendance at school have been passed, and in 21 per cent. only of the civil parishes which have established school-boards have by-laws been passed. It thus appears that one parish in every ten has emancipated itself from Church schools, but only one in five of those so emancipated has thought it worth while to pass compulsory laws.

From these figures, it would appear that my educational friend was not far wrong when he made up his mind that the principle of compulsory attendance at school did not meet with much acceptance in the rural districts. But, on the other hand, it must be borne in mind that the rural districts in England are still under the thraldom of the clergy of the Established Church, and that any attempt to enforce the provisions of the Education Act so as to interfere with the clerical supremacy over the schools frequented by the humbler classes, has been determinedly opposed. It must also be kept in view that parishes and boroughs are, after all, but arbitrary units of population, taken in deference to ancient traditions and associations and for convenience. If the *population* under school-boards and under by-laws be massed irrespective of the division into parishes and boroughs, the statistics are more favorable to compulsion. The total population of England and Wales is nearly twenty-three millions, and of this no less than eleven millions, or fifty per cent., are under school-boards, and nearly nine millions are under by-laws. So that, considering the short time that the Education Act has been in operation, the promoters of it may feel fairly satisfied in having already persuaded nearly one-half of the population of the country to accept the illogical principles on which the compulsory provisions are based.

But the anomalies pointed at in the earlier part of this letter as existing in the rural districts, are too glaring not to attract attention. They can be remedied in only one of two ways; compulsory attendance at school must either be made universal or it must be given up. Mr. Dixon, the Radical member for Birmingham, and Chairman of the Birmingham Education League, has introduced a bill for the purpose of making it universal, and the bill was discussed and thrown out last week. His proposal was logical, but it was handicapped heavily by the only means which he suggests for applying the system universally,-viz., the compulsory extension of school-boards. Just at present local rates are regarded by farmers —and by land-owners, too, for that matter—as the invention of the evil one. They see their burdens increasing year by year from this agency, and they do not see how to escape from them. Local rates have twined themselves round the unhappy occupier, and he cannot shake himself free of them. A wail comes up periodically from every corner of England, uttered by the rate-ridden occupier in the very anguish of despair. Any sort of local board suggests to his mind new rates and new burdens; and a school-board more than any other kind of local board is an abhorrence to him. A school-board takes money out of one of his pockets by saddling him with a school-rate to keep up the schools, and it takes money out of the other pocket by depriving him of child-labor and compelling him to employ a man to do what a child used to do before these educational notions came into vogue. So long, therefore, as the British farmer or the British squire is in his present mood, there is no chance of universal compulsion being carried out by means of universal school-boards. It is no use pointing to Scotland, where school-boards and compulsion are both universal, and where the system is said to work smoothly and cheaply both in town and country. The English farmer knows little of Scotland, and what he does know he does not like. If Mr. Dixon cannot suggest any other means of extending compulsory education, he may as well leave it alone. With the clergy and the farmers banded together against him, and the Tories in power, he has no more chance of passing his bill than Sir Wilfrid Lawson has of passing his Permissive Bill or Dr. Kenealy of getting the fat convict of Wapping out of prison. Neither is there any chance of the doctrinaires giving up their hold upon the fragment of compulsion that they have secured in the rural districts, and the real, substantial slice of it they have secured in the boroughs. We must go on submitting to these anomalies as we do to many others in our queer, disjointed, and illogical social institutions. Hodge must go on seeing the bread taken out of his mouth by Prodgers's children, while his boys and girls are getting their heads stuffed with reading, writing, and arithmetic. Poor Hodge does not see anything but hardship in it. But he has submitted to hardship all his life, and this is only the old thing in a new shape. Let us hope that he may live to see his sons earning their £150 or £200 a year in a bank in the county town, and his daughters settled, as certificated teachers or telegraph clerks, on an annual income greater than the aggregate amount which their father earned in half-a-dozen years; and possibly at the same time the young Prodgers will be as the old Prodgers, earning wages at 12s. or 15s. a week in field labor, and crying out against the tyranny of compulsory education.

## NEW UNIVERSITIES IN FRANCE.

PARIS, July 2, 1875.

PUBLIC instruction is divided into three parts in France, viz., primary, secondary, and the higher. The primary education is given in municipal schools, the secondary education in municipal or state colleges, and the higher instruction in the various faculties of the university. There is only one great University—a state university—though the faculties exist in more than one place. The Minister of Public Instruction is officially termed the Grand Master of the University. This organization bears the marks of the great centralization achieved by the French Revolution and by the Emperor Napoleon. The Revolution took the work of education from the hands of the Catholic clergy, and the university in all its branches preserved a completely lay character. It was not till long after the Revolution that the clergy claimed the right to open colleges; the struggle was conducted with more vigor than success by Lacordaire, by Montalembert, and others, under the reign of Louis Philippe; they called themselves the champions of the liberty of teaching; they were condemned before a court of justice for having opened a school without the authorization of the Grand Master of the University. It was a striking spectacle to see a peer of France and a Dominican monk defend themselves in the name of liberty against an administration which called itself liberal. The movement in favor of free teaching was hardly perceptible at first, but under the currents of politics ran the invisible currents of the religious life. The Revolution of 1848 did more than anything for the cause which Montalembert had vainly defended; all the conservative instincts of the country became alarmed, and Napoleon III. easily obtained the influence of the Catholic clergy when he promised M. de Falloux that he would leave the field of education open for all. During the Second Empire, the University and the Catholic clergy divided between themselves the work of secondary education; a number of colleges were opened by priests. The Jesuits have now in Paris, in the rue des Postes, an enormous establishment, specially devoted to the candidates for the two great military schools, the Polytechnic and St. Cyr. They have very able teachers, and they now send every year a number of young men, educated under their influence, into the ranks of the army. Bishop Dupanloup has a very large college near Orléans; I could cite many others.

Secondary education had practically become free; but what we call the higher instruction still remained a monopoly of the University. It was so in a double sense; there are no other faculties of law, of medicine, of science, of letters than those which are directly controlled by the University, and these faculties alone can confer the degrees which are necessary in France for the exercise of all the so-called liberal professions. The National Assembly has just framed a law which allows the establishment of new universities, with faculties of law, of medicine, or letters and sciences. The Bishop of Orléans was the principal orator who advocated the rights of the

church to dispense the higher instruction ; but the law was not distinctly made for the benefit of the church; and, though the teaching of the State University may be considered on the whole as very liberal, it is supposed that the Positivists, the scientific philosophers, will try to establish a university of their own in Paris. The Catholics intend to make at first a great university at Angers, on the plan of the Catholic university of Louvain in Belgium. One cannot help being struck with the increasing resemblance between French and Belgian affairs ; the Belgians have their free university of Brussels, which is very liberal in tone, and their Catholic university of Louvain, which is Ultramontane. We shall probably soon have our free university of Paris and our Catholic university of Angers.

It is, however, no small affair to organize a great university, with all its faculties ; such an enterprise requires not only a great outlay of capital in building, grounds, laboratories, collections, and libraries, but it requires a strong, solid staff of teachers, ready to compete with the teachers of the state. The Catholics will be ready to give much money for such a purpose, but the Catholic clergy will perhaps at first have some difficulty in finding in its own ranks a sufficient number of professors of law, of medicine, of science. It is wonderful, however, in what a short time the clergy has risen from the profound ignorance in which it was kept—I mean, of course, in certain matters which were out of its traditional culture. I will take architecture, for instance : there was a time when all our churches were spoiled as much as they could be by ignorant priests ; now there are lecturers on architecture in all the seminaries, and some priests have become authorities on various styles of Gothic or Roman art. Father Secchi is a great astronomer ; Father Moigno, now a chaplain at Saint Denis, is well acquainted with science. But a university needs more than a few distinguished men; it must have a whole phalanx. The Freethinkers, the Positivists, will have to contend with other difficulties in their own university ; there is so much freedom allowed in the teaching of the State University that there is hardly room for an advanced university. There are sensational lectures at the Collége de France, at the École de Médecine, where the young men of the Latin Quarter can vociferate and show their colors.

The number of high professorships now already existing is already very large. I find in the *Annuaire* of Public Instruction, published in 1874, the following number for Paris alone : Faculty of theology, 7 professorships ; of law, 24 ; of medicine, 33 ; of sciences, 18 ; of letters, 13 ; College of France, 36 ; School of Pharmacy, 9 ; Museum of Natural History, 17 ; School of Oriental Languages, 14 ; School of Hautes Études, 17 ; École de Chartes, 7 ; High Normal School, 26 ; School of Archæology attached to the National Library, 1 ; professorships at the School of Fine Arts which have not a technical character, 4. Total, 226, reckoning only those which are of free access and which have no technical object. There are, besides, numerous professorships at the Polytechnic School, at the Conservatoire des Arts et Métiers, at the School of Mines, at the School of the Ponts et Chaussées. I have not counted on my list the two free schools, the School of Political Sciences and the School of Religious Studies. Paris, as you will see, is not ill provided with the means of giving high instruction.

Let us now look at the provinces. I have classified the centres of high culture by the number of their professorships ; my list will give you a sort of intellectual geography of France. Nancy has faculties of law, medicine, science, and letters, and a school of pharmacy—in all, 47 professorships. Bordeaux, with faculties of theology, of law, of letters, and a school of medicine, has 41 ; Montpellier, with its faculties of medicine, of sciences, of letters, and its school of pharmacy, 38 ; Toulouse, 36 ; Aix and Marseilles together, 35 ; Lille and Douai together, 32 ; Lyons, 29 ; Rennes, 29 ; Grenoble, 28 ; Caen, 28 ; Poitiers, 28 ; Dijon, 27 ; Rouen, 23 ; Clermont-Ferrand, 20 ; Besançon, 19 ; Nantes, 19 ; Angers, 19 ; Tours, 10 ; Algiers, 8 ; Arras, 8 ; Limoges, 8 ; Chambéry, 7 ; Montauban, 7. This makes in all, in 25 different towns, 71 establishments, faculties, or schools of medicine, and 546 professorships. It must be added that only four cities have complete universities where all the faculties are found together, viz., Nancy, Bordeaux, Montpellier, and Toulouse. These four cities alone can be compared to the German universities. It is clear, therefore, that the province is not so well provided with the means of high culture as the capital ; and in this field, as in many others, the process of centralization has been injurious to the country. It is all the more so because Paris is not a very desirable centre of education in many respects. Its pleasures are too absorbing, and living is too dear in it for many young men.

If addition is made of all the high professorships in Paris and in the provinces, we find the total to be 772 ; in the 21 universities of the present German Empire we find as many as 1,700. The proportion shows clearly that much remains to be done in France in order to provide the highest class of education ; and we cannot, therefore, join in the cry which has been made against the so-called Ultramontane law of the Chamber. Since the state has concentrated the means of higher education in five cities only, it will be well if the church or private associations institute complete universities in other places. It is not a little absurd, for instance, that in a place like Lyons there should be no faculty of letters, no public lectures on history, on literature, etc. Most of our divided faculties in the provincial towns have a mere vegetative existence. I long ago came to the conclusion that all the faculties ought to be concentrated together as they are in the smaller German universities. This concentration attracts a large population of students, it creates healthy rivalries, it facilitates the formation of larger libraries. When a city has only one or two faculties, they become a mere luxury ; the professors soon find themselves without an audience. Our present seventy-one provincial establishments might with great advantage be reduced to about fifteen ; these fifteen would become alive, while the seventy-one are dormant ; but it is always difficult to deprive a provincial town even of what it has ceased to use for a long time. The all-powerful state could do so, however, by withdrawing its subventions, as the small cities could not keep faculties at their own expense. On the whole, the new law ought to be approved by those who desire that high instruction should be spread all over the country, and that Paris should not have, with four other cities, its monopoly. It will satisfy also those who believe that there is too much routine in the teaching of the French State University. I am not afraid of the intrusion of error in matters of science ; the truth will defend itself. A professor of geology in a *soutane* cannot alter the series of formations or change the name of fossils. There is something pleasant in diversity ; the facts are always the same (as Madame de Staël said : "Rien n'est bête comme un fait"), but they may be interpreted in various ways. It is well that they should be, and that men be forced to choose. France may receive a new development from the free rivalry of various universities ; the great practical difficulty lies only in the right of giving degrees, as these degrees are necessary for all the liberal professions. Under the present system, the degrees are conferred by the professors of the university ; if every new university is allowed to give degrees, these degrees will be only worth what the university is worth, and the public will not be able to judge between a doctor of Angers and a doctor of Toulouse. The Assembly has provided that the examination for the degrees shall be passed before a mixed commission, composed half of professors of the State University and half of professors of the free university at which the student wishes to graduate. But this arrangement may be rejected at the third reading of the law, for it has only been read twice as yet, and there is a terrific opposition against the system which would take away from the state the exclusive right of conferring degrees.

## Notes.

THE Smithsonian Institution and the Indian Bureau are engaged in forming for the Centennial a collection exhibiting the past and present history of the aboriginal races of this continent. To this end, they solicit donations of prehistoric relics as well as of modern objects bearing upon ethnology or manners and customs, including skulls, skeletons, photographic portraits, etc., etc. The ultimate destination of these contributions will be the National Museum, unless in exceptional cases, when the Institution may be glad to borrow what owners are not ready to part with. Transportation will be paid for on receipt in Washington. For detailed instructions, application should be made to Prof. Henry.——A biography of General Thomas and a history of the Army of the Cumberland are in preparation by Chaplain Van Horne, of the regular army.——William W. Wheildon's 'New History of the Battle of Bunker Hill' has reached a second edition. It is cleverly arranged, and furnishes a good deal of information not embraced in the other histories we have already noticed. The map is the same as that which accompanied Pulsifer's. The partisans of Prescott and of Putnam respectively should be satisfied with Mr. Wheildon's adjustment of their rival claims ; no one man commanded at Bunker Hill, but it may be regarded as a double fight under the two commanders just mentioned. Mr. Wheildon has in press 'Beacon Hill : the Beacon and the Monument.' ——The Boston Common Council have voted to take the necessary steps to complete, so far as practicable, the record of births, marriages, and deaths in that city prior to 1849, and have confirmed the mayor's judicious appointment of Messrs. W. H. Whitmore and Wm. S. Appleton to serve without pay as Record Commissioners for five years ——John Wiley & Son add to their series of reprints of Ruskin's works the selections made from his 'Modern Painters' by his friend "the younger lady of the Thwaite, Coniston," under the title of 'Frondes Agrestes.' In the foot-notes, which are new, the author plays the part of the Greek chorus towards his former

opinions.—'De Parodiis eis quibus exprimitur a comicis Graecis iudicium seu censura disseruit Theophilus Sihler' is the title of a Leipsic doctor's dissertation, which shows everywhere diligence, research, and thorough reading, and is not without interest. But there are many things in the Latinity which must shock the taste of the *amplissimus philosophorum ordo*, and the printing of the Greek extracts is to the last degree slovenly and wild.

—The unusual features of *Harper's* for August are a short poem, "Sunrise in Venice," by Joaquin Miller, and Mr. Longfellow's "Morituri Salutamus," which everybody has read in the magazine or, by courtesy, in the newspapers. Of the first four illustrated prose articles, it is enough to mention their titles, and to say that the illustrations are the best part of them. They treat of the origin of the express business ("An American Enterprise"); the "Ancient Pueblos of New Mexico and Arizona"—a well-written paper; "Caricatures of Women" (by Mr. Parton); and "Moosehead Lake," by Rev. J. H. Ward. Professor Rau's readers may congratulate themselves that his admirably clear and learned series of articles on the "Stone Age in Europe" is not yet terminated; the public at large, we hope, may count on the privilege of owning them hereafter in book-form. Extremely valuable for reference is the centennial paper (the tenth) of this number, on the "Growth and Distribution of Population," by Gen. Francis A. Walker. The progress of each of the thirteen States from its first settlement is given in detail according to the best authorities, and from 1790 the census returns are variously made use of to exhibit the extension of settlement, the increasing proportion of city to total population (from a thirtieth, 1790, to a fifth, 1870), the centre of gravity of population, the arithmetical process of the national growth, the development of the postal service, the constituents of our population, etc., etc. The particulars of the last-century immigration are very interesting, and many of them we have found not familiar to us. The inter-State migration is illustrated by two shaded maps, which have not, so far as we know, been published elsewhere, showing the territory which New Yorkers and South Carolinians respectively had by natural selection gone out to occupy when overtaken by the census of 1870. As regards the old question of native and foreign fecundity in the United States, Prof. Walker expresses himself very decidedly: "There is not the shadow of a statistical reason for attributing to the native American population, prior to the War of Secession, a deficiency in reproductive vigor compared with any people that ever lived upon the face of the earth."

—During the past few years the sums of money raised by the alumni of various colleges in the country for their general objects, by means of small subscriptions, have been quite large. Yale has, we believe, collected a larger sum than any other, while the Harvard fund would have been as large had it not been for an independent subscription made necessary by the Boston fire, which also had to come out of the pockets of the graduates. The original intention of the Harvard fund was the collection of a sum of $500,000 from all the graduates, $10,000 on an average being the sum expected from some fifty classes. This amount was to be raised in ten years, and the trustees of the fund were to receive the payments made by the collectors in the various classes, and whenever these amounted to $50,000, turn them over to the college. $100,000 has been paid to the college, and we understand that the trustees are now in receipt of a considerable sum towards the second hundred thousand. The statistics of the money collected from the classes show great differences in the total amounts credited to each, but whether these differences come from a difference in wealth or zeal does not of course appear. The great merit of funds of this sort is that they give an opportunity to modest people, who dislike connecting their names with their good works, to promote the cause of sound education without a needless flourish of trumpets, and without being put to the necessity of finding some previously unheard-of object for which to make a separate and generally insufficient foundation.

—That the American genius is too inventive will be allowed, we suppose, by any one who has given any attention to the subject. A curious illustration of this is furnished in a paper read before the Medico-Legal Society of New York by Dr. Frank H. Hamilton, which has been printed in the St. Louis *Medical and Surgical Journal* for July, and separately. It appears that the surgeon, of all medical practitioners, is peculiarly liable to prosecution for malpractice, and that during the period from 1833 to 1861, or thereabouts, so frequent were these prosecutions in New York, and also in the Eastern and Western States, that "many eminent surgeons felt compelled in self-protection to abandon the practice of surgery." Latterly, the danger to the profession has again revived, and Dr. Hamilton was recently addressed by a brother physician with reference to "some kind of a contract which he had been informed was used by the professor when taking charge of important surgical cases. In the midst of an ignorant community," he wrote, "he had learned the folly of being perfectly unprotected while carrying on quite an extensive surgical practice, and asked for a copy of such paper or contract." This was only a sample of many letters which had been received by Dr. Hamilton. The branch of surgery most exposed to prosecution was that of fractures and dislocations, in which American surgeons have a high reputation abroad, as, from the mechanical nature of these operations, was to be expected. But herein seems to have lain their peril; for they relied too much on their improved appliances, and promised better results to their patients than they were able to achieve, the line between the possible and impossible not having been drawn by carefully collected statistics until Dr. Hamilton himself began the task in 1849. In the meantime, a change has been going on in the treatment of fractures, and there has been a partial return to old and discarded methods, and the surgeon who now employs the forms of apparatus or dressing in vogue twenty-five years ago does so at the risk of being held responsible for an error of judgment in resorting to an obsolete practice. On the other hand, to adopt the new methods implies a guarantee of the inventor's claim in regard to their efficiency, and a failure to make good this claim will be attributed, not to the preposterousness of it, but to the surgeon's want of skill. So, between the over-sanguine inventor and the public which is quite ready to admit his pretensions, having the American mania for "improvements," the surgeon is certainly ill at ease. Nothing will save him, concludes Dr. Hamilton, "but the Truth, and in such a form that it can be made available by the profession, the public, the lawyer, and the courts."

—The comparatively small amount of attention bestowed by our press on the death of Professor J. E. Cairnes we are afraid is due to the curious absence of his name from the popular biographical dictionaries. This again is due, we fear, to the retirement imposed on him by ill health during the twenty best years of his life. He was during nearly the whole of that period a martyr to rheumatism in its worst form, and, we presume, to it he finally succumbed. He was an Irishman, and a graduate of Trinity College, and gave very early proofs of ability in the field which he afterwards cultivated so successfully. He held the Whately Professorship of Political Economy about 1857—but we cannot vouch for our dates—and was Professor of Jurisprudence and Political Economy in Queen's College, Galway, when our war broke out. The only thing he had then published was a small volume based on his lectures, entitled 'The Logical Method of Political Economy.' On the outbreak of the war he made what we think it is fair to call the first conspicuous attempt to set the British public right as to the nature of the struggle, by a lecture delivered before the Dublin Young Men's Christian Association, in 1862, at which the Lord-Lieutenant, the Irish Solicitor-General, and other distinguished men were present, on "The American Revolution." College lectures, delivered subsequently, in elucidation of the way in which the course of political history is affected by economic agencies, led to the publication of his book on 'The Slave Power,' which at the time attracted so much attention, and which was so much prized here as almost the only contribution of any weight to the American side of the controversy which appeared in England during the war. It is not possible to appreciate the book at its real value now, when so many things have been made plain which, to the English mind at least, at that period were dark or obscure; but it was and is the ablest essay on the origin of the struggle, and on the constitution and tendencies of slave society, which has appeared on the other side of the Atlantic, and the successive editions of it which were published had perhaps more influence than anything else in turning the tide of English opinion. The decline in his health compelled Professor Cairnes's retirement from his chair and from Galway, and he fixed his residence in the neighborhood of London, where he remained until his death, and was appointed Emeritus Professor of Political Economy in the London University, and, we believe, delivered occasional lectures. But his work thenceforward consisted mainly in contributions to the leading reviews, on economical questions of the day. A collection of these in a volume, entitled 'Essays in Political Economy, Theoretical and Applied,' was published two years ago, and has been noticed in these columns. It was followed last year by his work on 'Some Leading Principles of Political Economy,' which is his principal contribution to the literature of his subject, and which we have also reviewed. No economical writer in England has, since Mill, commanded so much of public attention and respect, and when one reads what he accomplished while struggling with a cruel disease, one cannot but mourn deeply over the restrictions thus imposed on him, and the early termination of a career which, even with these disadvantages, was exceptionally brilliant. He was a disciple of Mill, but had enjoyed a more steadying education, and was thus saved from some of the later eccentricities of that philosopher, though he shared his expectation of great

political regeneration through female suffrage. It is unpardonable—considering the amount of rubbish the work contains—almost ludicrously unpardonable, to find his name omitted from the latest edition of 'Men of the Time.' And we are sorry to add that no mention is made of him in the New American Encyclopædia.

—Mr. George Birdwood points out in the *Athenæum* of July 3 some of the botanical anachronisms which he had observed in the paintings at the Academy Exhibition. The first example that he cites is the worst: "In 'Anne Page and Slender' Mr. Cope introduces, all of a row, the *Tulipa Gesneriana*, not known in England before 1577; the Red Geranium, introduced in 1710; the Camellia, in 1739, and the Chinese Primrose, in 1820." Mr. Bedford's posing his "Hermione" between a lemon and an orange tree reminds the critic that neither was known to the Greeks and Romans, or perhaps was ever seen by Shakspere himself. "The first orange was planted, it is said, in England (in Beddington Park) in 1595, and it was a century later before it came to be generally grown in England. The lemon was not introduced until 1648." Even Mr. Alma-Tadema's learning does not save him from Mr. Birdwood's chronological yard-stick, though the latter may misinterpret the flowers which he calls "some species of Allium" and "a crocus (?)," and which, he says, would not be found flowering at the same time. "In flower pictures artists habitually group together flowers which never flower together, and habitually introduce plants of the New World into pictures of the ancient life of the Old World"—for example, the aloe, cactus, and maize, which Europe owes to the discovery of America. Accuracy in these particulars is, as Mr. Birdwood suggests, worth aiming at by artists and novelists. We append the sources of information which he enumerates. A review of Merivale's essay ('Historical Studies,' London, 1865) may be found in Vol. III. of the *Nation*, p. 490:

"Loudon's 'Encyclopædia of Plants' gives the date of the introduction of every exotic plant into England. Gerard's 'Herbal' is a complete encyclopædia of the plants known in England in the seventeenth century; and in Pearson's 'Historical Maps of England' there is invaluable information regarding the ancient fuels and woods and landscape of England. Daubeny's 'Plants of the Ancients' gives a complete list of the trees and shrubs indigenous to Italy and Greece. The great work of Schouw may well have been overlooked by English artists, but they must be familiar with the late Mr. Herman Merivale's delightful 'Essay on the Landscape of the Ancients'—a good example of the charm which a true scholar can impart to the exact correctness of a scientific treatise."

—Christian II. of Denmark is a prince who has come down in history with a reputation as unequivocal as that of Richard III. or Tiberius. We might, to be sure, have expected to see him vindicated by modern criticism, but were not quite prepared for the form which the vindication has taken. Miss Otlé, author of a history of Scandinavia, recently published, reviews in the *Academy* (May 15) the unfinished history of the Northern Kingdoms from 1497 to 1536 by the late C. F. Allen, we believe the most eminent of the Danish historians. This author, she says, "has found a royal hero after his own heart in Christian II., who, forsaking the traditions of his family, the prejudices of his rank, and the tendencies of his early religious training, endeavored summarily to trample aristocracy into the dust, to raise democracy to be the mainstay of royalty, and to annihilate the entire system of the Romish hierarchy." The critic goes on to censure the onesidedness with which the historian extenuates the cruelties and perfidies of which the king was guilty in his efforts for reforms in themselves desirable; for it was to the unlimited sway of the nobility, confirmed under the early kings of the House of Oldenburg, that the subsequent decay of Denmark was due. It is interesting to compare Herr Allen's view of Christian II. with that of Michelet, to which we recently drew attention, and which seems to reconcile the statements above made with the familiar fact that Christian is known as a champion of Catholicism. It seems to have been a pure matter of policy. "This man," says Michelet, "who on one occasion hunted a bishop with dogs, now associated his court with that of the Catholic religion"; his was, he adds, "a magic name, which always rallied the Catholics and the peasantry."

## PATTISON'S CASAUBON.*

MR. PATTISON'S work could not be described in the set phrase of the day as "the life and times of Casaubon." It is what it purports to be, a biography, and because Mr. Pattison has the rare self-restraint to confine himself to the functions of a biographer, he has produced a book which is a model of biography, and for that reason a most instructive contribution to the true understanding of history. A "life and times" is, even in the hands of so meritorious an author as Mr. Motley, certain to become either a biography encumbered with irrelevant matter, or a history cramped, curtailed, and distorted in the endeavor to force the events of a period into the limits of an individual life. Biography, though it cannot be history, has an important relation to historical study. It supplements and tests the work of the historian. A biographer's object is, if he understands his part, to narrate, illustrate, and explain the life of an individual. But the minuteness, the individuality, the reality of biography at once tests and gives meaning, substance, and truth to the generalities of history, for a general proposition must, if it be worth anything, be true of the particulars which it includes, and historical generalizations can be neither put to the proof nor understood unless they are tried and explained by the lives of individual men and women. To estimate the exact worth of Mr. Pattison's minute research, or to weigh the precise merit of his criticisms on Casaubon's scholarship, requires a knowledge equal to Mr. Pattison's own, to which few persons have any claim. The general character of the work and its historical interest, however, may be appreciated by any educated person who studies it with care.

The primary fact which is apparent on the most cursory survey of the book is that Mr. Pattison has held it to be the first duty of a biographer to discover, as far as may be, and narrate in the plainest language the facts of his hero's life. This duty he has performed with an amount of laborious conscientiousness which would have been fully appreciated by Casaubon himself, but is not likely to obtain its due praise from a generation who delight in sentimental reflections and bold generalizations, but have no sympathy with the love of accuracy, which is at bottom the love of truth. The first page of the work affords an example of Mr. Pattison's quality. It contains two notes. The first examines thoroughly the question whether Casaubon's mother was named "Mergine" or "Meugine" or "Mengine." The second exposes the mistake of writers who have thought that Casaubon's father came from Dauphiné, whereas his native province was Gascony. If any reader thinks lightly of such accuracy, he will soon discover from the book itself examples of the importance of minute truthfulness of statement. Casaubon was professor of Greek at the Academy of Geneva. It was the "latest and not the least valuable of Calvin's institutions," and it has been described by later writers as a school of general education with students numbering more than a thousand daily. Mr. Pattison investigates the real character of the place, and especially the ground on which the allegation that a thousand students attended lectures rests. He shows conclusively that there is no reason for believing in this numerous attendance; that the institution was really "an elementary school, and a seminary for ministers"; this, he adds, was what was wanted, and this was what Calvin supplied. "A grand academy of letters or science, such as historians find in his scheme, was as little in Calvin's thoughts as the steamboats which now ply on the Lake Leman." By careful investigation of minute detail, Mr. Pattison thus dissipates a misconception which, by turning a high school supported with difficulty into a university, has misrepresented the condition both of Geneva and of Protestantism at the end of the sixteenth century, and hence has concealed from view the real character of the desperate and heroic struggles by which Geneva preserved herself and the cause of Protestantism. In this case, an investigation of minutiæ leads at once to general conclusions of interest.

Any reader of Mr. Pattison's work, however, must be prepared for the fact that it consists, to a great extent, of details which will weary those who cannot interest themselves in the picture of a scholar's life and in its bearing on a crisis in the world's history. The account of Casaubon's literary labors, of his difficulty in obtaining books, of his constant want of means, of his unceasing struggle to obtain the time necessary for his work—the lists of the books he wrote and of the works he projected, the entries in a diary which seems to have been a daily register of work done, will seem dull to persons unable to sympathize with a man whose life was a long martyrdom to his desire for erudition; but all these details are necessary to the picture of a scholar's life, and are still more necessary for the comprehension of Casaubon's character. Mr. Pattison shows peculiar subtlety in the analysis of the great scholar's mind, and in the skill with which, indulging in comparatively few reflections, he lets Casaubon, as it were, speak for himself. Casaubon's acts, his words, his writings, and his diary set the man himself before the reader. The peculiarity of his nature lies in the combination of some of the greatest qualities—enthusiasm for knowledge, love of truth, fervent religious feeling—with a certain pettiness and "doubleness" of mind and will which prevents him from taking rank among the highest class either of men or of scholars. He lacked, if we understand Mr. Pattison rightly, the originality of genius. His love of knowledge took the form of a passion for erudition, and his life was dis-

* 'Isaac Casaubon. 1559–1614. By Mark Pattison, Rector of Lincoln College, Oxford.' London: Longmans.

tracted by an uncertainty of purpose which kept him wavering between the rival claims of scholarship and theology.

The explanation of Casaubon's religious position is one of the most valuable, as well as one of the most curious, portions of the work. A man of simple habits and a singular incapacity for managing his worldly affairs, filled with religious sentiment which expresses itself in the pages of his private diary, he yet was suspected, not only by Catholics, but by his fellow-Protestants, of an intention to apostatize for the sake of gain. His career showed that he was prepared to make every sacrifice to the dictates of his conscience. His position at the court of Henry IV., where so-called "conversions" were the fashion, was not the only circumstance which excited suspicion. Mr. Pattison shows that Casaubon at one time was inclined towards Catholicism. His knowledge made him doubt much of the received Protestant doctrines. His sympathies made him lean towards the teaching of the early church. His moral feelings bound him to Protestantism, whilst his interest pointed to the advantages of conversion. The tragedy of the situation lay in this: that the great scholar seemed to the outer world to be weighing conscience against interest, whilst in truth he was balancing opposed views which he did not know how to reconcile. He was what would now be termed an Anglican. Neither Calvinism nor Romanism satisfied his peculiar turn of mind. When fortune brought him to England, he found in the Anglican compromise exactly the view suitable for a man of a morbid conscience unable thoroughly to acquiesce in the clear convictions of Continental Protestants.

The difficulties of Casaubon's religious situation arose at bottom from the perplexities of his own mind, but they were singularly aggravated by the circumstances of the time; and the sketch of his relation to the French Court gives a marvellous insight into the state both of politics and of religion. Few persons will read the account of Casaubon's residence at Paris without feeling that they have obtained a far more definite view than they before possessed of the state of religion in France during the reign of Henry IV. The "Catholic reaction," the power of the Jesuits, the decline of French Protestantism, are known in a general way to all readers of history; but these general terms acquire a new significance when the influences of the time are seen as they affected the career and thoughts of an individual man who must have been the representative of thousands unknown to history. The indescribable meanness of Henry IV. in urging for political purposes conversions which he knew to be mere acts of hypocrisy, his disgraceful desertion of the cause which he was bound to protect, the contrivances by which, as in the case of De Mornay, he caused a disgrace of his own most faithful followers, must make even admirers feel that the ablest of French monarchs was after all but a sorry hero. It is impossible also not to perceive that French Protestantism was morally ruined before the Revocation of the Edict of Nantes gave it a death-blow. Moral persecution had nearly achieved the overthrow which physical persecution finished. A perusal of the life of Casaubon excites wonder not that France should have met with many calamities, but that the nation should have survived the moral and intellectual degradation of which the defeat of Protestantism was the outward sign and cause.

Casaubon found refuge in England from the troubles of his existence at Paris, and here again his private life elucidates an historical period. No research will ever discover facts which can free James I. from the contempt which his most undoubted acts and the best ascertained traits of his character show to be his due. His relation, however, to Casaubon exhibits both the king and his court in their most favorable aspect, and explains the respect felt not for James's character, but for his talents, by men whose judgment cannot be set aside. In the same way, the relation of Casaubon to Oxford gives a vivid impression of the good no less than of the weak side of the university. This is a topic which Mr. Pattison handles with the adroitness of one thoroughly at home in his subject, and also with a grave irony and humor which is likely to be lost on those who are not tolerably acquainted with Oxford of the nineteenth century. A story is told of a young Jew who taught Casaubon Hebrew, and excited the interest of heads of houses both by his talents and leaning toward Christianity. His intended conversion, the excitement caused thereby among all the dignitaries of the university, the pedantic delays of the professor of divinity, the escape of the convert just before his intended baptism, the rage of his patrons, and his illegal arrest by the proctors, are all recorded, and should be read in Mr. Pattison's pages. What is not recorded, but may also be read there by those who can see between the lines, is that a little imagination can easily picture the comedy of Jacob Barnet being re-enacted in the year 1875. The Oxford of the seventeenth century is still in many respects alive, and could at any rate provide actors to fill all the parts in a farce like that of which Casaubon's teacher was the hero.

Nor is it by any means only in showing the likeness between the England of James I. and the England of Victoria that Casaubon's life has an historical interest. It explains one of the features of the seventeenth century which always perplexes modern students. Even Mr. Motley cannot fully understand why James I. should have written theological disquisitions instead of diplomatic despatches, or why all Holland should have gone mad, as it seems to the historian, over abstruse and uninteresting religious dogmas. Casaubon's career brings home the fact that theology was the interest of the day. It may be regretted that the English Court wasted the learning of the greatest scholar of the time in theological polemics, but it must be admitted that Casaubon himself had always hankered after theology. He shared the passion of his age; and the biography which brings out his individual feeling and character enables readers to understand the feeling and opinion of his time.

## TENNYSON'S QUEEN MARY.*

TO the readers of Tennyson this drama will be a surprise, and to many of them, at first, a disappointment; but the more judicious will find in it a new proof of the force and variety of that genius which gives to its author his easy and unchallenged supremacy over other contemporary English poets, and sets him in the rank of those few who, from Chaucer down to our time, have been best inspired in giving expression to the sentiment of the English people. It is foolish to compare this play with the historic plays of Shakspere. Shakspere stands alone in the joint domain of nature and of art. Tennyson is neither his rival nor his imitator. The motive and intention of the modern poet, no less than the spirit of his imagination, are radically different from those of the elder dramatist. Even the form and execution of his work show few traces of the influence of any Shaksperian model, and his individuality is as marked in this drama as in any previous poem.

And yet his genius displays itself here in such novel form, so unlike those which it has hitherto employed, that a certain disappointment may, as we have said, not unnaturally be experienced on first reading. This drama has little of the melody and sweetness which distinguish the lyric and idyllic compositions of the poet. It exhibits little of that subtlety of sentiment and refinement of diction in which the apt and exquisite expression seemed of even birth with the feeling itself, and formed such part of it that the two, like body and spirit, became one and inseparable. Nor does the drama directly display the personal passion of the poet. It makes no direct revelation of his personal character. It contains few passages of splendor of poetic eloquence, and still fewer traits of that highest inspiration in which the poet, surrendering himself to his genius, becomes the willing and responsive instrument of the divine Muse, and sings

"The undisturbèd song of pure concent."

Indeed, it is not as a poem that this play offers itself to us. It would be to misconceive the writer's intention to suppose his aim to have been to construct a play that should depend for its effect mainly on its poetic quality or on its adaptation to the stage. Poet and playwright he is in truth, but for the sake of teaching and inspiring, not of amusing. Poet, indeed, but Englishman much more; and playwright, that he may be preacher and may appeal with the voice of their own history to the conscience and the heart of his people. Tennyson is, however, far too excellent an artist and far too intelligent a moralist to confuse the demands of art and of morals. His art is not subjected to his moral intention. It only chooses, for the sake of a moral end, a different but not less artistic form and method from those which it has hitherto preferred. The art is not diminished, distorted, or enfeebled, and the drama is as true to the principles of dramatic art as if no moral zeal gave fervor to its lines and meaning to its scenes. The play is not the worse that it is inspired with patriotic emotion. The verse is but the more masculine that within the outer meaning of its words lies an inner kernel of significance.

It is plain that Tennyson has chosen his subject not merely because of its fitness for dramatic presentation, but because he felt that the lessons to be drawn from Queen Mary's reign needed to be pressed home upon the England of to-day. The subordination of English interests to the behests of Rome, the temper of the Roman Church, the quality of character fostered and developed by its teaching, the logical consequence of this teaching in the destruction of liberties and in fostering intolerance and persecution, were shown in Mary's brief reign of five years as in no other period of English

* 'Queen Mary. A Drama by Alfred Tennyson.' [Author's edition from advance sheets.] Boston: James R. Osgood & Company. 1875. 16mo, pp. 284.

history. In reading the signs of our times, it would not be surprising if Tennyson read with alarm signs of a renewal of Roman influence in English affairs, and of a revival of the authority of the Roman Church among the higher as well as the lower classes of the people. The conditions of culture and of opinion throughout Europe are such that the claims of the Roman Church, asserted as they have lately been with astonishing audacity, and pushed far enough to test the most elastic credulity, are admitted, with more or less intellectual reserve, by increasing numbers of men of weight in opinion and affairs. The Roman Church represents with a consistency to which no other church can lay claim the principle of authority in matters not merely of faith but of policy. The red-shirts of Paris, the sceptical philosophers of Germany, the modern school of scientific thinkers in England, the feeble and confused sects of Protestantism, are allies in driving a large set of men toward the gates, if not within the walls and defences of Rome. The love of mental repose and support, the desire to rest with absolute reliance upon a definite authority, are traits in many natures obviously inherited from a remote period. Few men can comfortably rely upon themselves; and the case now is such that a logically-minded man must either be content to fall back upon the reserves of his own intelligence or to haul down its flag and surrender his soul and life to the guidance, direction, and authority of the Roman Church. What this surrender and subjection mean is what Tennyson desires to bring home to the minds and to the hearts of his readers. He has no controversial purpose, but he has conceived of the reign of Mary Tudor as the time in which the principles and practices of the "grim wolf" of Rome were most plainly displayed in England, and with terrible suffering and degradation and loss of honor to the land. The history of these years reads itself to him into the drama, into the tragedy that he has written out—a tragedy with a whole people as its protagonist, and with the vast, vague, dreadful figure of the Scarlet Woman embodied in the miserable Mary for its heroine.

One familiar with the history of the period will note that Tennyson has kept close to the actual fact, and has introduced hardly an incident or a figure without warrant from the record. He has written a true historic drama, not forcing the occurrences or the personages out of their real relation to meet any supposed exigency of dramatic effect, but letting all unite as in the course of nature to bring about the fated close. There is no mounting of dramatic interest from act to act; no attempt on the poet's part by any inventions of fancy or display of pathetic sentiment to awaken our concern in the characters or fortunes of his historic personages. So strictly does Tennyson keep himself to the lines marked for him by the actual historic occurrences that he does not indulge himself in subtile analysis and development of character, and is not led away from his direct aim by any temptation to discover and represent the complex mutual influence of one nature on another, or to penetrate the secret of the plots and counterplots of the time. The play is simply a vividly imaginative reproduction of scenes and characters already known to us, and the setting of them in such light as may disclose the true meaning of events and the real import and effect of the intentions and deeds of the chief actors in the civil and ecclesiastical affairs of the time. This is the great merit of the work.

There is little need to point out its subordinate merits and minor beauties. Tennyson has never written more full and masculine verse than in portions of this drama, and never condensed vigorous thought into compacter form. The virile blood of the men of Mary's time seems to have flowed in his veins as he was writing. His verse at times, in its hard strength, seems to lack finish, and his turn of phrase to be chosen for force rather than for elegance. But these are marks of the feeling with which he wrote, evidences of the passion which underlies even this essentially objective poem. From what we have already said, it is plain that no one should turn to these pages for thorough and elaborate studies of character. Queen Mary is treated more fully, and in a sense more sympathetically, than any of the other *dramatis personæ*, but even in her case, as in the study of a character in real life, much is left to conjecture. There is a hint in the delineation of Pole of possible developments of finer motives and deeper emotions than are distinctly revealed. But, in truth, there is perhaps no higher praise of such a work than to say of it that it leaves on us an impression as if we had been with real persons, and not figments of the imagination, and that the best and strongest among them make us curious about them, and baffle our desire to gain assurance of motive and of aim, as we are made curious and are baffled in real life.

---

*We and Our Neighbors:* Records of an Unfashionable Street. By Harriet Beecher Stowe. (New York: J. B. Ford & Co. 1875.)—It would be rather awkward to attempt to tell what Mrs. Stowe's novel is about. There is a young woman married to an editor of "three papers—a monthly magazine for the grown folk, another for the children, and a weekly paper." This well-occupied personage, in a moment of easily conceivable bewilderment, invites an Englishman to dinner on washing-day, and this is how his wife, who is introduced to us as a model of the womanly graces, informs her cook of the circumstance (the lady, by the way, was one of the Van Arsdels, conspicuous among the first families of New York): "Mr. Henderson has invited an English gentleman to dinner, and a whole parcel of folks with him. . . . It's just sweet of you to take things so patiently, when I know you are feeling so bad, but the way it comes about is this." Mr. Henderson's dinner is one of the principal events of the book, and Mrs. Stowe's second manner, as we may call it, comes out strongly in the description of it. It proved a greater success than was to have been hoped—thanks to the accommodating disposition of the British guest. "Mr. Selby proved one of that delightful class of English travellers who travel in America to see and enter into its peculiar and individual life, and not to show up its points of difference from old-world social standards. He seemed to take the sense of a little family dinner, got up on short notice, in which the stereotyped doctrine of courses was steadfastly ignored, where there was no soup or fish, and only a good substantial course of meat and vegetables, with a slight dessert of fruit and confectionery. . . . A real high-class English gentleman," under these circumstances, the author goes on to remark (not oppressed, that is, by a sense of repletion), ". . . makes himself frisky and gamesome to a degree that would astonish the solemn divinities of insular decorum." In this exhilaration "soon Eva and he were all over the house, while she eloquently explained to him the working of the furnace, the position of the water-pipes, and the various comforts and conveniences which they had introduced into their little territories." They—who? The water-pipes? The phrase is ambiguous, but it is to be supposed that this real high-class English gentleman understood everything; for—"'I've got a little box of my own out at Kentish Town,' Mr. Selby said, in a return burst of confidence, 'and I shall tell my wife about some of your contrivances.'" It should be added in fairness that the conversation was not all in this dangerously familiar key, for we are presently informed that Eva "introduced the humanitarian questions of the day."

There are a great many other people, of whose identity we have no very confident impression, inasmuch as they never do anything but talk—and that chiefly about plumbing, carpet-laying, and other cognate topics. We cannot perhaps give chapter and verse for the discussion of these particular points, but the reader remains in an atmosphere of dense back-stairs detail which makes him feel as if he were reading an interminable file of tradesmen's bills. There is in particular a Mrs. Wouvermans, an aunt of the Eva just commemorated, who pervades the volume like a keeper of an intelligence office, or a female canvasser for sewing-machines. This lady, we know, is intended to be very unpleasant, but would it not have been possible to vary a little, for the relief of the reader, the form of her importunity? She also belongs to one of the first families of New York, and this is a specimen of her conversational English. She is talking about the Ritualists and their processions: "I'd process 'em out in quick time. If I were he [the Bishop] I'd have all that sort of trumpery cleaned out at once." But none of Mrs. Stowe's ladies and gentlemen open their mouths without uttering some amazing vulgarism, and if we were to believe her report of the matter, the language used by good society in New York is a singular amalgam of the rural Yankee dialect (so happily reproduced by Mrs. Stowe in some of her tales), the jargon of the Southern negroes, and the style of the paragraphs in the *Home Journal* about such-and-such a lady's "German." "Never mind, I'll get track of them," says the exemplary Eva, alluding to the ghosts which her husband jestingly assures her she will find in the house of certain opposite neighbors; "and if there's a ghost's chamber I'll be into it!" Hereupon (she has never called at the house in question before) she throws over her head "a little morsel of white fleecy worsted, darts across the street, and kisses her hand to her husband on the door-step." What would those personages whom she somewhere calls "the ambitious lady leaders of our time" say to that?

---

*Representative Names* in the History of English Literature. By H. H. Morgan. (Boston: Ginn Brothers. 1875. 8vo, pp. 47.)—In his preface, which is dated from St. Louis, Mr. Morgan states that "the wants of a busy age require some inexpensive book which shall furnish general information, together with a firm grasp of the movement in each field of effort." If this sentence be a little vague, it is perhaps due to its peculiar metaphorical turn. His object has been to afford brief answers "to the various rational questions which might be asked about an author as an author,"

"The time of any author has been indicated by giving the date of his birth and death, together with the era in which he would be classed." In the case of American writers, however, the eras are not used, for a reason which we confess our inability to understand, namely, that "contemporaneity is of small consequence." We had supposed that whether of consequence or not, contemporaneity might be determined by the dates of birth and death, which are given. Mr. Morgan, disregarding what he esteems as the "almost valueless distinction of prose and verse," divides literary works under nine "forms" and classes authors under seven "phases." "The characterization consists," says Mr. Morgan, "of criticisms which fairly represent the strength and weakness of the author, and these criticisms have as far as possible been taken from critics whose opinion is known by all to be beyond dispute." This assertion is supported by frequent citations in the body of the work from such critics as George Gilfillan, H. T. Tuckerman, Rufus Griswold, S. A. Allibone, G. S. Hillard, E. P. Whipple, W. Phillips, W. C. Wilkinson, and others whose opinion is undoubtedly not less "known by all to be beyond dispute."

The list of English names contains most of the chief writers; but in a catalogue that includes William H. Russell we might have expected to find Jeremy Taylor, and room might certainly have been made for Fuller, Isaac Walton, Burton, Smollett, Crabbe, Mill, and a few more. Mr. Morgan sometimes excites the surprise of his readers by his classification of the authors; for instance, we find Browning classed as a metaphysician, and are told that his "poetry is distinguished by the essential characteristics of the great masters of 'classical music.'" Cowley also appears as a metaphysician, and we are told that he is the "best of the Concetti," whatever this may mean. Mr. Morgan says that Tom Hood is the "first of English humorists *in order of time*, as well as in point of merit"; that Chesterfield "is still the best authority on manners"; that Dryden "gave us the first specimen of prose style and the first versified personal satire"; that Dr. Johnson "gave us the first English dictionary"; and he makes so many more statements of a similar kind that it seems clear that he uses "first" in an unusual manner, probably because he conceives priority in English literature to be of no more consequence than contemporaneity among American authors. In dealing with the Americans, Mr. Morgan classes Hawthorne as a metaphysician, while he puts Richard Hildreth, Theodore Parker, Jared Sparks, and Daniel Webster among the sentimentalists.

The book is dedicated to and seeks "the approval of those who by their acquaintance with literature are rendered competent to express a rational opinion." We will not presume to claim a place among this select body, but our rational opinion is that this is a very amusing production.

*Fungi: Their Nature and Uses.* By M. C. Cooke, M.A., LL.D. Edited by the Rev. M. J. Berkeley, M.A., F.L.S. [The International Scientific Series.] (New York: D. Appleton & Co. 1875. Pp. 299.)—The subject of this volume is not a bad one for the International Series, but the treatment strikes us as indifferent. It might advantageously have been made either more popular or more scientific, or both. It is abundantly technical, yet without much explanation of terms; it touches, but only touches, upon a great variety of topics, some of them recondite or of small concern to the beginner. The earlier pages plunge into the Schwendener algo-fungal lichen controversy, but give to the uninitiated mind no very clear idea of the question at issue, and no adequate statement of the investigations by which it has recently been supported. Nylander's epithet, "the *turbid* hypothesis of Schwendener," is approvingly quoted; but the turbidity we should complain of arises not so much from the hypothesis as from the way the question is agitated. But, after all, this volume is replete with interesting matter, is well illustrated, and is likely to serve a useful purpose, although it may not add to the renown of a "scientific series" in which Tyndall and Bagehot lead the way, and to which *our own* Professor Cooke contributes a model volume. Although the veteran Mr. Berkeley's name appears upon the title-page as editor, his preface states that the principal part he took in it "was to recommend Mr. Cooke to the publishers," and to suggest "such additions as seemed needful, subjoining occasionally a few notes."

HENRY HOLT & CO.'S SCHOOL-BOOKS

include, among others, Freeman's Historical Course, the Class-room Taine, Siglar's English Exercises, the Ord. Series of Classics, Whitney's German Course, Otto's French and German Courses, etc. Reference is made to the faculties of all leading institutions. Catalogues sent on application. Address

HENRY HOLT & CO.,
25 Bond Street, New York.

"When not to be obtained at the Bookstores and News Stands, send the price direct to the publishers, who will forward postpaid to any address"

THE NEW NOVELS:

*Open! Sesame!*

By Florence Marryat, author of 'Love's Conflict,' 'Veronique,' 'Woman Against Woman,' etc. 1 vol. 8vo, new style, paper, 75 cents.

*A Woman's Ransom.*

By F. W. Robinson, author of 'Slaves of the Ring,' 'Little Kate Kirby,' 'For Her Sake,' etc. 1 vol. 8vo, new style, paper, 75 cents.

ESTES & LAURIAT,
Old No. 143 Washington Street, New No. 301, Opposite Old South, Boston.

*David G. Francis,*
DEALER IN NEW AND OLD BOOKS,
17 ASTOR PLACE AND 140 EIGHTH STREET,
NEW YORK.

Priced Catalogues issued from time to time and sent to any address. Foreign Books imported to order promptly.

MANUAL OF INTRODUCTORY Chemical Practice. By Professors Caldwell and Breneman of Cornell University. Ready in August. For sample sheet, etc., apply now to FINCH & APGAR, Ithaca, N. Y.

Fifth Thousand.

*"A book worth much more than a mere mention. . . . Reading her novels, you are profoundly thankful that the great public who will read fiction of some sort, whether or no, should have anything so thoroughly healthful and noble in tone as the tales of Jean Ingelow for their delectation. 'Off the Skelligs' was a delightful book, and we are glad to find that 'Fated to be Free' introduces us afresh to some of the characters in the former novel. . . . To read 'Fated to be Free' is to be introduced into the society of people who live nobly, who put duty before inclination, and honor before desire, to whom the Bible is something more than a dead letter."*

—*L. C. M., in the Tribune.*

*Fated to be Free.*

PRICE $1 75.

Sold everywhere, mailed, post-paid, by the publishers,
ROBERTS BROTHERS, BOSTON.

W. P. NIMMO'S BOOKS.

Messrs. Cassell, Petter & Galpin announce with great pleasure that they are appointed sole Agents in the United States for the above important Catalogue of Publications.

Mr. Nimmo's Standard Series and Poets have so long been noted as the cheapest and best books ever issued that it is not necessary to say more than to intimate that stock and catalogues are to be had from Cassell & Co., 596 Broadway, New York. Our own new catalogue will be ready shortly. Application for copies requested.

BUSINESS ESTABLISHED IN 1835.

BOERICKE & TAFEL,
*Homœopathic Pharmacy,*
145 GRAND ST., NEW YORK,

Keep constantly on hand a complete stock of reliable Homœopathic Medicines and books on domestic practice. Goods sent to all parts of the country, by mail or express.

Send stamp for descriptive catalogue and price current. Address as above.

*A LIFE OF SAINT TERESA,* *having rare claims to Protestant notice, just issued by Macmillan & Co., is discussed by "The Reader" on page 64.*

# The Nation.

*NEW YORK, THURSDAY, JULY 29, 1875.*

## The Week.

THE rise in breadstuffs culminated during the week, but not until it had contributed to the decline in the price of gold to 111¾. Speculators were responsible for enough of the rise to alarm prudent people, and altogether the reaction is regarded as salutary. To suppose, however, that the entire movement was speculative, and the work of Chicago speculators, is to admit that Chicago controls not only the foreign markets, but also is able to control the elements—to say when it shall rain, and how much. Even should one-half the recent advance in breadstuffs be lost, the country will be richer by many millions than it would have been. At one time, so heavy were the exports of grain, and such was the abundance of bills of exchange resulting therefrom, that it looked as if enough exchange would be made to supply the demand until cotton bills appeared, and that it would be necessary to ship no more gold coin. On this supposition the gold premium melted away each day, until on Friday the price was 111¾. What also contributed to this decline was the fact that the Syndicate were offerers and sellers of sterling exchange, they having been able to sell new fives in Europe more rapidly than they could buy the called five-twenty six per cents to pay into the Treasury for the new fives. As a result, they transferred to the Treasury the proceeds held in Europe of the sales of new fives. The bad feature of this business is that, when the five-twenty six per cents which are called come from Europe—as they must later in the season—they will have to be paid for in whatever we can export most cheaply—it may be grain, cotton, securities, or gold. Later in the week, the weather reports from Europe were more favorable, and breadstuffs declined in the English markets enough to check exports from here, and the price of gold here recovered about two "points," on the possible necessity of more gold shipments from New York.

---

At this point came the unexpected announcement that the domestic and foreign banking-house of Duncan, Sherman & Co. had suspended. Their doors were closed at 11.30 o'clock Tuesday, and gold advanced immediately to 116⅞, falling back to 113⅝. Those entitled to speak for the house say that their liabilities amount to between $5,000,000 and $6,000,000, and that their assets will fall far short of the smaller of these sums. The house has been in existence since 1850, and was well grounded and successfully managed until of late years, when it became more closely identified than was for its good with such railroad enterprises as the Atlantic and Great Western, the Erie, and kindred roads. It was also supposed to have locked up its means to an imprudent extent in Southern securities, and to have engaged in cotton operations beyond the strict limit which prudent banking establishes. However this may be, Mr. William Butler Duncan, the head of the house, and with a character beyond reproach, recently, so his friends say, caused a close examination of the assets of his firm, and found that they in no way corresponded with its liabilities. He then made an effort to procure new capital sufficient to give him a dollar in hand for every dollar which could be demanded of him, having determined to carry on the business only on this condition, and not to resort to the method, so common with houses in such circumstances, of straining his credit by "kiting." Having failed to get this new capital, he ordered the suspension.

---

Tammany Hall has decided to reorganize three of its districts, the third, the eleventh, and the fifteenth, the leaders in which are "Jimmy" Hayes, John Morrissey, and ex-Judge Ledwith. The charges against these gentlemen are that they have been stirring up disaffection among the workingmen, getting up a bogus workingman's meeting, and in general not merely failing to promote harmony in the camp, but sowing the seeds of disloyalty. John Morrissey, it seems, contributed fifty dollars to the workingman's meeting in a clandestine way, sending it by a third person, who represented the benefactor of the movement to be "a lady on the Eastern Boulevard." Morrissey, however, and his associates in disgrace have assumed a defiant attitude, and the former has telegraphed to some of the newspapers from Saratoga that he challenges the Honorable John Kelly to meet him in the Tammany arena, and prove which is the better man—morally and politically, that is, and not, as the *Herald* maliciously suggests, physically and pugilistically. The councils of Tammany are so secret, and its movements are so mysterious, that it is difficult to know whether the discipline now administered is the result of a determination on the part of the "Swallow-Tails" to get rid of the "Short-Hairs"—in which case, as it would be war to the knife, Morrissey and his friends must perforce hire a hall and organize a new party—or whether it is one of those feuds which can be made up without any permanent loss of good feeling. It looks more like the former, though Tammany has not by any means deserted the workingman, and is not supporting General Porter in his reduction of wages.

---

The Legislative enquiry into the conduct of the Emigration Commission, like nearly all the other enquiries instituted of late, has come on something in the nature of corruption. There is a tax called "head-money" levied on the steamship companies, which was, we believe, $2 50, and is now $1 50 for each passenger landing in the country, and is devoted to the supply of very useful protection and assistance to the newly arrived emigrants. In 1871, the steamship companies, as well as the Commissioners of Emigration, came to the conclusion that the tax had better be reduced, and it was, of course, for the pecuniary advantage of the companies that it should be reduced. The first thing that happened after this decision had been reached was the appearance of one Nolan at the steamship offices with a numerously signed petition in favor of the reduction, and offering his services as an able and influential agent to "put the thing through" at Albany. The combined companies accordingly employed him, and agreed with a certain appropriateness to pay him by "head-money"—that is, he was to receive a quarter of a dollar for each emigrant who should arrive by the steamships during the six months next ensuing, and he did actually pocket about $30,000. Now, it so happens that Nolan is a partner of General Patrick H. Jones, and it so happens that General Jones was the Postmaster who had to be made United States Marshal when General Sharpe, the then Marshal, had to be made Surveyor, when the civil-service "rules" had to be suspended at the New York Custom-House on that celebrated occasion in 1873 when Mr. Curtis resigned. It appears also that several thousand dollars were paid in 1874–5 to Mr. Abram Wakeman, another old postmaster, we believe General Jones's predecessor, who used it to prevent a legislative increase of "head-money." Indeed, whatever was done to "head-money," whether it was raised or lowered, some fine old politicians gained by the process. It is now said that this money was paid uselessly; that the lobbyists did not earn it, and did not influence the required legislation; but this is always said when money is traced to their pockets, and certainly it is almost impossible to disprove it. But then, what persons who seek legislation almost invariably find is this, that though paying money out to lobbyists may not get them what they seek, refusal to pay it is almost invariably found to be followed by failure to get what they seek. Now, the refusal and failure may not, humanly speaking, have any connection except a chronological one, but the average American citizen is apt to believe

that they stand to each other in the relation of cause and effect, and therefore pays his money. The "licentious and unbridled press" are, we need hardly say, now dragging the private affairs of Nolan, Jones, and Wakeman before the public for the satisfaction of a morbid curiosity, raising once more the question, how can we expect eminent citizens to go into public life when their characters are assailed in this ruthless way?

---

The bankers, following the example of most other trades and professions, have been holding a convention at Saratoga, and we suppose some good has resulted from it, though what good does not clearly appear from the report of the proceedings. They resolved that "every good citizen ought to hasten the day" when the Government will redeem its promises in coin; that the taxes on national banks ought to be reduced; that stamps ought not to be required on checks; and that anybody who wants to exchange coupon for registered bonds ought to be allowed to do so. It cannot be said that these resolutions have the weight which might fairly be looked for in the suggestions of a body of this character. The best-known bankers in the country do not appear to have taken part in the proceedings, though there were rumors that the wealth of the profession was largely represented in it. It is a pity, on the whole, that the prevalent love of conventions cannot be turned to better account. Every summer sees a greater number of them; but one reads the reports of their debates with, to say the least, an unsatisfied feeling, and wonders whether the time and money of so many busy men could not have been turned to better account. Members of such bodies ought to bear in mind that it is their duty, above all things, to avoid bringing the ancient and honored custom of public deliberation into contempt or disrepute. Nothing has done more to found and foster the great American institution of "rings" who breed the troublesome race of "managers" than the unwieldiness, and incapacity, and gullibility of conventions, caucuses, and other large assemblies. Anybody who goes into one ought, therefore, to be fully satisfied in his own mind that there is something he greatly desires to say, and somebody he greatly desires to hear, and that he is not likely to furnish an audience to busybodies and bores.

---

Since the act of June 20, 1874, which made arrangements to take $55,000,000 of currency from the Eastern banks and distribute it among those of the West, and thus not only promote justice but raise the West out of the slough of despond, sixty-three new banks have been organized, and have drawn out the sum of $2,061,250 in notes, and banks already in existence have drawn out $5,724,275, making in all $7,785,525. Altogether, fresh notes to the amount of $11,601,892 have been issued within this period named, and $9,627,066 have been surrendered and destroyed, so that the actual addition to the circulation of national-bank notes under the act of January 14, 1875, which was intended to increase the supply of them *ad libitum*, is $1,974,826. It thus appears that the crippled manufacturer, and the languishing farmer, and the idle laborer won't take the medicine prepared for them by Congress. They actually refuse to draw their money and be prosperous. The secret of this lamentable failure lies, we imagine, in the fact that none of the acts providing for an increase of the currency have made proper arrangements for its distribution among the sufferers. As matters stand, if anybody wants his share of the currency, he has to give security at the bank for its repayment; if the bank wants the currency, it has to buy Government bonds and deposit them with the Treasury. Now, in this lies the cause of the failure of the present legislation. The remedy is plain, and there is only one remedy: the Treasury ought to be directed to give currency to all persons applying for it. If this were done, a very large amount of currency would be drawn out at once, certainly not less than $1,000,000,000, the whole country would be speedily full of money, and either the "wheels of industry" or some other wheels would receive a prodigious impetus. Is it not singular that such acute thinkers as Messrs. Morton and Logan should not have perceived this difficulty?

The inflationists have been reinforced during the past week by Mr. Peter Cooper, who has published an amazing pamphlet, showing that both Daniel Webster and Calhoun were believers in paper issues. The *Tribune*, however, has proved very conclusively that Mr. Cooper has been misled into publishing audaciously garbled extracts from their speeches. Even were the extracts genuine, and it could be proved that both Webster and Calhoun were supporters of *assignat* schemes, it would prove to any one familiar with the subject merely that they were on this point deluded and ignorant men. The economic laws of currency are simple deductions from first principles, which have been verified in several centuries of experience, and will remain true to the end of time, no matter what either Webster or Calhoun thought of them. Of course, the weight of such authority with the mass of men, who have no time to look into such questions for themselves, would be very great; but how any one who writes on the subject for the instruction of the public can bring himself to believe that such questions are to be decided by counting the number of deceased politicians on one side and the other, we cannot understand. The number of eminent statesmen deceased, from Moses' time down, who have believed that the sun went round the earth, is far greater than the number of those who have believed the contrary; but what should we think of any one who asked us on that account to believe that they were right?

---

Judging from the circumstances attending the loss of the *Atlantic* and the *Schiller*, the problem of steam navigation is no longer the provision of staunch and well-formed ships, but of captains who are willing to take even the commonest precautions. The *Atlantic*, it was shown in the investigation, ran nearly eight days in a dense fog, and the captain, although he knew at the end of that time that he must be somewhere near the coast, steadfastly refrained from throwing the lead, and went plump on shore on a calm night, and lost nearly the whole of his passengers. The chief officer, we believe it was, being asked why they did not sound, said "they thought it would be of no use," which has the ring of a ghastly joke, because one of the uses of the chart is to give the depth of water and the nature of the bottom at various points off the coast. One would have supposed that a catastrophe so horrible would have inspired caution among commanders of steamers, but it does not seem to have done so. The *Atlantic* was lost in 1873; just two years later the captain of the *Schiller* did exactly what the captain of the *Atlantic* did—ran for some days in thick weather, or in a fog, by dead-reckoning, and, knowing he was close on a dangerous coast, refrained from sounding, and went on the rocks in the usual manner, and lost nearly all his passengers, and was lost himself. The commissioners appointed by the English Board of Trade to enquire into the circumstances attending the wreck, found that the dead-reckoning was incorrect, that the ship had greatly overrun the calculated distance, and that, "had a cast of the lead been taken an hour or half an hour before the vessel struck, it would have shown them their proximity to the danger and the error in their reckoning, and would probably have averted this sad disaster." They find, however, that the captain had totally neglected both the Admiralty directions for approaching the English Channel, which "include a careful use of the lead," and the instructions of the Company, which enjoin on commanders a strict attention to "the usual precautions when making the land." This almost raises the question, comic as it may sound, whether a certain number of male passengers ought not to be legally authorized to require the captain to sound in thick weather and in fog. But the matter is being brought home to owners in a very unpleasant manner in the English courts, the widow and children of a passenger named Kruger, lost in the *Atlantic*, having sued the Company, in the Queen's Bench, for damages incurred by the negligence of its servants in the navigation of the ship. The Company did not attempt to deny the negligence, and the jury assessed the damages at £5,000, or about $25,000 in currency. We trust the effect of this will be salutary. Companies must find some means of making their captains obey instructions.

The plan proposed by Mr. Gladstone, in his recent article in the *Contemporary Review*, for the prevention of the disruption in the Church of England which is foreshadowed by our London correspondent in his letter this week, is but an enlargement of the old receipt for the production of ecclesiastical harmony—"In essentials unity, in non-essentials liberty, and in all things charity"—that is, his remedy is admirable until one comes to apply it, by deciding what are the "essentials" and what the "non-essentials." He urges that the Church of England is worth preserving; that it cannot be preserved without self-restraint and forbearance on the part of the contending factions in it; that the Ritualists and Anti-Ritualists must agree not to attach "doctrinal significance" as now to certain forms and ceremonies. For instance, he demands that when a priest is reading the consecration prayer in the communion service, his facing eastward shall not be held to mean that he believes in the Real Presence. He desires to have rites and ceremonies and dress and posture treated as the mere "clothing" of the Gospel, of small account as long as "the integrity of the Christian dogma is upheld," "its working is traced," and "its adaptation to human thoughts and human welfare exhibited in all the varying experience of the ages." If the Anti-Ritualists agree to take this view of the matter, and to rely for the reform of abuses in the Church "on moral forces, and not on penal proceedings," he thinks all will be well. But then, as our correspondent has pointed out, a worshipper in the remote country districts cannot wait for the working of "moral forces" If his parson takes to ritualizing he cannot get rid of him until he dies, and "the moral forces" may not begin to produce an effect in the diocese until his successor is appointed, and in the meantime the disgusted worshipper has no other church to go to; therefore he longs to call in the police and put an end to what he considers obnoxious innovation at once. It has to be remembered, too, that the only condition on which the Anti-Ritualist can agree not to attach doctrinal significance to forms, is the promise of the Ritualist to do the same thing. He may say to him, "I will agree not to attach doctrinal significance to your position at the communion service if you do not yourself." But if the Ritualist replies that he does not attach doctrinal significance to it, the Anti-Ritualist naturally asks why he takes a position which means nothing and yet annoys the congregation? The fact is, we believe, that the Ritualists do attach much significance to their ceremonial, and that Mr. Gladstone's compromise is therefore not possible.

---

The extraordinary scene reported by the Cable as having occurred in the House of Commons when Mr. Plimsoll heard the announcement that the Government were going to abandon the bill for the complete carrying out of his reform, can hardly be considered symptomatic of any change in the manners and morals of the House. Mr. Plimsoll is an excitable gentleman who has taken up a piece of reform in which he can get but little support from the persons he is trying to benefit—the sailors, while he has arrayed against him a very powerful and influential class, the ship-owners, whom he has greatly exasperated. This alone would have been sufficient to make him nervous, even if he were not so constitutionally. He has, too, fallen into the besetting sin and misfortune of all persons in his position, by making, in his speeches and pamphlets, a good many exaggerated charges, and has had to sustain several suits for libel. So that, since he began his agitation, everything in his surroundings has helped to weaken his self-control and prepare for his late outburst of passion in the House. But that he has not labored in vain is proved by the Board of Trade returns of the results of the exercise of the power bestowed on them by an act which he got passed in 1873, which show that out of 479 vessels charged with "unseaworthiness," they found the charge proved in the case of 464, while the Board has detained 48 for "overloading," and declares that no charge under either head has ever been made to them without some foundation. The public meantime have so unmistakenly taken sides with Mr. Plimsoll on the main question—between himself and the Government, and not between himself and the House—that the Government has given way, and brought in a measure extending the powers of the Board of Trade.

---

The Irish Team have again won the Elcho Shield at Wimbledon by four points over the Englishmen, and three over the Scotchmen, and the conclusion is not unnaturally drawn that as the Americans have beaten the Irish, *they* would *a fortiori* have won it had they competed. The excitement appears to have been very great during the contest, and to promise a period of international rifle-shooting which will be very full of "events." Colonel Gildersleeve proposed on the ground a match at Philadelphia in 1876, and Lord Wharncliffe hoped that the three British Teams would be represented, and they doubtless will be. All this promises an immense rise in the position of skirmishers, deerstalkers, and other marksmen, and a great stimulus to the manufacture of arms of precision. There are in England, too, signs of a revival of popular interest in cock-fighting, which has become very common in the North, and which one old British sportsman, Admiral Rous, has written to the *Times* to defend as an amusement of a remarkably elevating character, and to draw attention to some signs of decline in British morals as a consequence of its abandonment. In fact, nearly all branches of sport, except pugilism, seem to be "looking up." Rowing, walking, running, swimming, cricket, baseball, sight-shooting, horse-racing, and pigeon-shooting are increasingly popular, and now cause an enormous amount of money to "change hands" every year.

---

Only two things seriously occupy the attention of the political world in France—the inundations at the South, and the dissolution of the Assembly. The dissolution is strenuously urged by the Left, who called for an adjournment in August, and then one more meeting in October for the election of the seventy-five senators, but no other business. The Government has made a semi-official announcement that it does not interfere, and does not mean to interfere, in the matter, which lies entirely in the hands of the Assembly. The Committee recommended an adjournment from August 4 to November 6, but the Assembly voted by a heavy majority on Thursday last to adjourn to November 16. The news from the inundated districts presents no new features, though the loss of life is probably greater than was at first supposed. Subscriptions for the relief of the sufferers are coming in from all parts of Europe. M. Rouher has, in a recent debate over a report made by the Prefect of Police on the machinations of the Bonapartists, avowed that while the party he represented would remain faithful to the Republican constitution until it was revised, they, like the Legitimists, confidently expected to see it revised, and considered it only a temporary arrangement. This theory will probably be pushed hard by the two monarchical parties until the new constitution has actually been set to work, and an Assembly and Senate elected under it.

---

The part played by the French press during these momentous discussions has been at once droll and melancholy. In fact, the journalists are mainly occupied in the composition of "Terrific Suras," which appear to have much the same source as those of Mahomet. M. Granier de Cassagnac, the father of the redoubtable Paul of the *Pays*, twenty years a Deputy, a commander of the Legion of Honor, and sixty-eight years old, challenges M. Gambetta for language used towards him in the *République Française*, which Gambetta is supposed to control. The *République* replies that Gambetta is too useful to his country and his paper to fight. Whereupon, M. Granier de Cassagnac replies that he well knows where to find Gambetta when he wants to kick him. At the same time, M. Clemenceau hints in the *République* that he would like to have a set-to with Paul. Then M. Rosati, of the *Presse*, has fought a duel with M. Perivier of the *Figaro*, who was slightly wounded, as attested by the seconds in a solemn "procès-verbal." And M. Debrousse, the editor-in-chief of the *Presse*, offers to fight M. Villemessant. The *Gaulois* announces that five press duels were pending in the second week of this month between distinguished Parisian journalists.

## THE DEMOCRATIC INFLATIONISTS.

THE canvass now pending in Ohio is perhaps the most interesting one which has occurred since the war, not only because the currency and the public debt form the main issues in it, but because the position of the Democrats has been taken up after the currency question has been very fully discussed, and after the absurdity of the inflationist theory of our financial troubles has been demonstrated by actual experience. We now *know*, as most of us did not know before 1873, that abundance of money and low rates of interest are not all that is needed to revive trade and industry. While the Western and Southern philosophers were clamoring, two years ago, for a redistribution of the national-bank circulation, on the ground that it was monopolized by the East, and that their region did not receive its full share of it, it was easy enough for those who knew anything about the laws of currency to tell them that it did not make any difference how Congress distributed the currency, that it would only stay where it was needed—that is, where there was most buying and selling to be done. But they would not believe it any more than a Sioux would believe an astronomer if he told him he could measure the distance to the moon. They have now had actual proof of it in the fact that the West and South have not applied for their share of the currency, having in fact no use for it. If a Western banker were supplied with ever so much currency today, he would carry it to New York to lend, and in New York he can get so little interest for it as not to make lending worth the trouble. And yet, in the face of all this experience, the Western Democrats continue their clamor for plenty of irredeemable paper-money, and Messrs. Allen and Pendleton go about in Ohio making speeches in favor of it which, to many people at the East, sound like the ravings of drunkenness.

Now, why is it that the experience and discussion of the last three years have not produced enough effect to prevent such an agitation as we see going on in Ohio? How is it that the Democrats, after having been originally "hard-money men," have now so great a fondness for irredeemable paper-money, and do not pay the least attention to your citations either of American or foreign experience of paper-money? Why is there no use in arguing with either of these gentlemen? Why does any attempt to argue with them end in simply bandying contradictions? The fact is that the Democratic party, though it has the reputation of having been a "hard-money" party, was always almost as much in favor of Government money as of "hard-money." It disliked paper-money in the earlier years of its existence rather because the banks issued it than because it was paper. Jefferson thundered against the "scrip" of the United States Bank, but he was not opposed to the issue of Government scrip. In fact, the present system of Government issues may be found set out with the utmost distinctness in his correspondence, particularly in the year 1813. Nearly all his denunciations of the banks and their "rag-money" are interspersed with suggestions for an issue of Government paper, "based on" a "specific tax." He proposed the payment of the expenses of the war with England by such an issue, or, in other words, proposed the very scheme which Mr. Chase produced forty-seven years later—barring the legal-tender clause—for paying the expenses of putting down the rebellion. Writing to Mr. Eppes, June 4, 1813, Jefferson shows how the thing is to be done. "Every one knows," he says, "that although not literally, it is nearly true, that every paper dollar emitted banishes a silver one from circulation. A nation, therefore, making its purchases and payments with bills fitted for circulation thrusts an equal amount of coin out of circulation. This is equivalent to borrowing that sum, and yet the lender, receiving payment in a medium as effectual as coin for his purchases and payments, has no claim to interest. And so the nation may continue to issue its bills as far as its wants require and the limits of the circulation will admit. Those limits are understood to extend with us at present to $200,000,000—a greater sum than would be necessary for any war." One has only to put this idea into the hands of "the debtor class," headed by demagogues like Morton and Logan and Allen and Pendleton, to have the Ohio system of finance very speedily evolved from it. Nor did Jefferson's plan die out of the memory of his disciples. In 1837, in the very midst of the distress arising out of the bursting of the bank bubble, and when all true Democrats were clamorous for "hard-money" and against "rag-money," Mr. Silas Wright, the leading party chief, who hated and denounced bank-paper as much as Jackson himself, introduced in the Senate, and carried against the opposition of the Whigs, who advocated a plain, honest loan, the issue of $10,000,000 of Treasury notes, as a medium in which Government dues could be paid, in the absence of redeemable bank-notes, and he did this under the recommendation of the President, Mr. Van Buren, in his message. It was perhaps the best thing to be done in the peculiar circumstances of the case, but it showed that Democratic hostility to paper-money was by no means absolute; that it could be easily reconciled to paper issued from the right quarter—in short, to "the people's paper," as distinguished from the paper of "monopolists" and "speculators."

The idea which is at the bottom of the whole agitation in favor of unlimited issues of greenbacks is as old as the French Revolution, and has come steadily down, in one shape or another, along with the "principle of equality" and the "rights of men." It is now embodied in the political gospel of the Continental Socialists, under the name of "gratuity of credit." The Continental Socialists have, however, pushed the doctrine further than their American imitators, and made it more efficient, because they have not only provided for the issue of irredeemable paper by the Government, but provide the means by which the "poor man" can get hold of it. Anybody who reads the speeches of Allen or Pendleton or Kelley on the wonderful effects of plenty of paper-money in "quickening the wheels of industry," will observe that they never describe the mode in which the paper is to reach the wheels. They tell you of the blessing it would prove to the farmer and mechanic, but they refrain from mentioning how the farmer or mechanic is to get it into his possession. They do not propose that the Government should give it away. Even the illustrious Kelley denies his benignant currency to all who cannot provide themselves with 3.65 bonds. But how is the hardy farmer or the industrious mechanic, who is short of money, to procure bonds, in order to exchange them for currency when business is active, and draw them out again when business is dull, etc., etc.? This lamentable gap in the system the French and Germans have filled up by declaring that when the Government makes its issues of paper, it shall lend them to all well-behaved citizens, through banks established for the purpose all over the country; and not on security either—for the present bankers lend on security, and what is lending on security but monopoly? The object of Government issues is, and clearly ought to be, the supply of money to persons who have no security to offer—or, in other words, to the class which needs money most—and this the European plan attains. Some such idea, though in a very vague shape, undoubtedly lies at the bottom of the Kelley and Allen discourses. The training they have unconsciously received in an acute business community doubtless prevents them from proposing openly that "the people's money" should be lent gratis to all comers, because this would make Americans laugh; but the notion that the Government ought in some manner to see that everybody has as much money as he needs in his business is, nevertheless, running through their minds, and furnishes, or would furnish, the premise the suppression of which makes much of their talk seem so irrational. Kelley has made a lame attempt to meet the difficulty with his 3.65 plan, and Wendell Phillips with his plan of lending on mortgage on real estate at four per cent., but neither of them makes any provision, as we have already remarked, for the poor fellows who have neither bonds nor real estate.

Another thing to be taken into account in trying to explain the steady growth of the inflationist element in the Democratic party is, that it has always been an *à priori* party: its doctrines have never, either in their conception or in their application, been influenced much by either home or foreign experience. That the inflationist element has been steadily gaining ground in its ranks

for some years, there is now no denying. It has been kept down on the Eastern seaboard by the predominance of the commercial interest; but in the West it comes nearer every month to taking entire possession of the party, and laughs at the way in which the Eastern organs fling financial history at its head. The way in which the Cincinnati *Times*, for instance, approaches the question, is far more orthodox than the way in which the *World* approaches it. The Western journalist does what the poets do, and what Democratic publicists have always done, in dealing with important political problems—"he looks into his own heart and writes"; while the *World* quotes the report of the Bullion Committee and the history of the French assignats and other musty records of past ages. In this way the Democrats changed the constitution of this and other States, by making all the officers directly responsible to the people, giving us the elective judges. There is nothing in the annals of the human race, or in any man's experience of human nature, to justify faith in such changes any more than to justify faith in irredeemable greenbacks; but then the Democratic politician did not care for annals, and the human nature he studied he learnt about through Jefferson from that profound observer, Jean Jacques Rousseau. It was Rousseau who first revealed to the world the extraordinary things man was capable of if released from the bonds of usage and tradition, and his pictures made an impression which may be found stamped deeply in the reports of many an American convention. The latest traces of them are undoubtedly to be seen in this Democratic clamor for paper-money. What Mr. Allen and his followers are telling us, or trying to tell us, is that we have been misled by oligarchical traditions into the belief that coin was the only good money, and that a community which had lost it ought to try to recover it; but that we deceive ourselves; that by deep thinking we should discover that paper-money was the true foundation of national happiness, just as Karl Marx would tell us that long familiarity with the practice of giving security for loans, and of paying them back at a fixed date, had blinded us to the national advantages of loans without security, not payable at any date; and that in this system of banking reflection would show a right-minded man that the world would find a key to the terrible problem of poverty. If you cite experience to these philosophers, they tell you that experience is of no value, because their system was not tried under the proper conditions. It has to be put into operation in a Democratic atmosphere and amid Democratic institutions, and then it will work. If it does not work, it is either because you do not go far enough, or because some malignant person behaves badly. Their paper would be good money if selfish men did not refuse it or undervalue it, just as their constitutions would be good constitutions if every man did his duty. You cannot corner them in discussion. No *à priori* politician or financier was ever cornered, because he always takes to himself wings, as people do in dreams, and perches on some distant and sunny height while you are preparing your cords to bind him.

## THE DECISION IN TWEED'S CASE.

WHEN the decision in Tweed's case was first announced, it was received by the public generally, as we stated in these columns, with respect. An examination of the text of the decision, however, in the light of Mr. O'Conor's recent attack, renders some modification of this statement necessary. There are only two points in the case, both of which can be stated in a less technical manner than they were stated by the Court. The first of these is whether proceedings to upset Tweed's sentence could be taken by a writ of habeas corpus; the second, whether the Court of Oyer and Terminer which sentenced him had power to try an indictment embracing several distinct offences, and, in passing sentence, sentence the prisoner separately for each one. As a general thing, all indictments are made up of various counts, in which the same offence is restated in different ways to avoid any possible variance between the charge and the evidence; but in Tweed's case a number of indictments for separate offences had been united in one indictment, so that he was actually found guilty of fifty-five distinct offences. The charges were, neglect of a statutory duty in auditing bills. It is unnecessary to recall all the circumstances, but it will be remembered that the statute under which Tweed was sentenced authorized the imposition of a fine of $250 and imprisonment for one year. The Court below sentenced him separately on a number of counts, making his total term of imprisonment twelve years. The Court of Appeals has now decided that the sentence was wrong in going beyond one year, that the Court exceeded its jurisdiction in passing such a sentence, and that Tweed is entitled to release on habeas corpus. We do not propose to review either of these points—which are both technical, and must of course be settled in the long run by the courts—but merely to call attention to one or two features of the decision which render it interesting.

The assumption, let us say in the first place, made by some of those who have defended the decision, that the tribunal is too "august" to be criticised, is not only wrong but preposterous. It is very true that what the highest court in a State decides to be law is law, and must not be resisted, but obeyed; but no one who has looked into the volumes of the New York reports can be unaware that one of the characteristic features of the law as announced by the judges of this tribunal is that, in vulgar parlance, it is so often six of one and half-a-dozen of the other; unanimity being to all appearances the thing most dreaded by the Court, and a learned diversity of opinion that most desired. What the Court of Appeals announces to be the law is the law; but then the question is, What has the Court of Appeals announced? If we are really prevented from criticising its decisions, we are certainly poorly off. Of course the criticism ought to be carefully made; and we must think that Mr. O'Conor did his case an injury by his manner of putting it. But there is something positively grotesque in the notion that in these days and in this city we are not to criticise a judge. Three of them have been got rid of by means of the most open and unqualified attacks on the part of the press and the legal profession; and we hardly supposed that three years after the impeachment of Barnard we should hear that the "august" nature of a New York elective court placed its judgments beyond and above criticism. Judges who are elected may be re-elected, and how are we to tell whether to cast our vote for Judges Andrews and Folger at the next election, supposing them to be renominated, unless we know whether the decision in the Tweed case was right; and how can we find this out except by general discussion? The good layman cannot be expected, even by those who urge upon him the necessity of going to primaries, to spend his days and nights in a law library, hunting up the law of habeas corpus and cumulative sentences, so that he may know how to cast his ballot. The only way in which he can arrive at a decision is by getting the opinion of the profession on the merits of the jurists who are likely to be recommended to him. The notion that the judges cannot reply is an antiquated delusion. In the first place, their decisions ought to be the most effective reply possible; and in the second place, the Chief-Justice can perfectly well have a newspaper interview and explain his motives. This is what the present Chief-Justice of the Court does every few months, no doubt after consultation with his brethren.

There are two opinions in the case, one given by Judge Allen, and the other by Judge Rapallo. The former of these is long, professional, and adapted to the comprehension of lawyers; the latter is short, and seems to have been written partly for the judge's own satisfaction, and partly to bring the case within the grasp of the editorial mind. His opinion principally dwells upon the terrible consequences which would flow from permitting cumulative sentences. We have read his opinion with care, and endeavored to discover exactly what the "enormous injustice and oppression which might result from the adoption of the rule" are, but in vain. Most people who have merely glanced at the opinion probably suppose that the injustice and oppression consist in adding one sentence to another, and imagine that the Court holds the utmost extent of the punishment for wilful neglect to audit the county accounts to be imprisonment for one year and a fine of $250. But the Court does nothing of the kind, but plainly intimates that if the indictments had been kept separate, Tweed might have been sentenced for twelve separate terms, each

beginning at the termination of the one immediately preceding. The Revised Statutes (2 R. S. 700, § 11) have expressly provided for this, as the Court points out. What, then, is the terrible wrong or injustice in uniting the offences in one indictment? As far as we can make out, it is that the law in this State allows a person indicted for misdemeanors five peremptory challenges, and Tweed was therefore entitled to as many of these challenges as there were offences charged, multiplied by five. The enormity of the oppression caused by the fact that Tweed did not enjoy the right to eleven hundred peremptory challenges (there were two hundred and twenty separate counts), may be inferred from the fact that the allowance itself is purely local and statutory. It does not exist in England at all, and we believe not in Massachusetts. Think, says Mr. Justice Rapallo, of a petty magistrate sentencing a prisoner to a term exceeding the limits of his life—as, for instance, for maltreating one hundred separate sheep! But we have the authority of the Court for saying that there would be no objection to this if the sentences were inflicted separately—a hint, by the way, which may prove of some value to Mr. Bergh. We are thus forced to conclude that the enormous injustice and oppression to which the opinion refers are already part of the law of the State, and that if Tweed had been sentenced on separate indictments he would still be languishing on Blackwell's Island. All lawyers are aware of the danger a court is in when it tries to declare the law from a consideration of the consequences, and not from the cases. Of course the diminution of the right of peremptory challenge is something not to be overlooked; but we cannot bring ourselves to feel about it as we do about the habeas corpus or the bill of rights. The popular impression that the case puts an end to "cumulative sentences" will be seen, from what we have said, to be erroneous. The cumulation of sentences seems to be reaffirmed and approved by it.

To turn now to the main opinion, that of Judge Allen, which contains the quotation from Mr. O'Conor's brief, the first thing that strikes us about it is the jaunty way in which it is written. We have not been able to re-examine all the cases cited; but if the Court has cited them in the same sort of way that it has discussed the Tichborne case, the opinion is certainly a curiosity. The paragraph relating to the Tichborne case is as follows (the English is that of the Court):

"The Tichborne case is claimed to be a direct authority for the conviction and sentences in the case at bar. Tichborne was convicted upon a trial before Lord Chief-Justice Cockburn and his associates of two distinct acts of perjury upon separate counts in an indictment, and sentenced upon each to transportation for the term of seven years, as for disconnected offences; and it is said that the time named is the extreme limit of punishment upon a single conviction for the crime charged. But if it be shown there was a conviction for two offences, which in this State would be felonies, on the same trial, which is not permissible with us, the decision cannot be regarded as authoritative evidence of the law with us. It is enough to say that no question appears to have been made to the judgment, and whether it was authorized by some value we do not know. Be that as it may, the judgment has not received the deliberative sanction of any court in banc, and has not ripened into a precedent even in England. It is at most but evidence of what the common law is as now administered in that country, but no evidence as to what it was on the 19th of April, 1775."

Now, in the first place, "Tichborne" was never convicted of anything at all. A man named Orton was convicted of perjury in personating Tichborne. This may seem a very trivial matter, but it is really such trivial matters as these which reveal the amount of care with which courts examine cases before citing them. In the second place, the case is spoken of as if it were an ordinary trial, and the point as to cumulative sentences was not probably considered. But as a matter of fact, for the express purpose of giving the decision additional solemnity and weight, the case was tried "at bar" before three judges, one of them being the Chief-Justice; and it is reasonable to suppose that if any error had been found in the judgment a most vigorous attempt would have been made to upset it. Again, the statement that this decision is "no evidence as to what the law was on the 19th of April, 1775," is very extraordinary. It is very good evidence, indeed, as to what the law was on the 19th of April, 1775. What the Court meant to say apparently was that a modern English case is of no binding authority in the courts of an American State, which is perfectly true, but the idea is very queerly and unjudicially expressed in the words we have quoted.

We have selected these little flaws as illustrating the legal tone of the opinion. We now come to the main charge brought by Mr. O'Conor—that the Court made a dishonest use of his argument. Summarily stated, the facts are these: Various statutes of this and other States give, in certain cases, the right to what are called "penal actions," or actions in which suit is brought to recover a statutory penalty. The object of these suits is criminal—not the vindication of a private right, but the punishment of the defendant for some act contrary to public policy. Take, for example, extortion on the part of a railroad: the machinery of the suit is civil, but the object is penal. That there is an analogy between these and criminal prosecutions no one denies, and the question has arisen whether the statutory penalty given for every violation of the law must be sued for separately, or whether a number of them can be united in one suit and recovered together. As a general thing, these penalties are merely fines, but they might no doubt include imprisonment, in which case the similarity of these actions to criminal trials would be still closer. Now, in September, 1871, Mr. O'Conor made an argument before the Court of Appeals in one of these penal suits (Johnson *agt.* the Hudson River Railroad Company), against the legality of a joinder of several offences in one indictment or penal action. Johnson, in the Court below, had sued for and recovered 526 different penalties of $50 each. This judgment was reversed by the Court of Appeals on other grounds which made it unnecessary to consider this point; but in Fisher *agt.* the New York Central and Hudson River R. R. Co. (46 N. Y. 659), Judge Grover, in delivering the opinion of the Court, said:

"This makes it unnecessary to determine whether if several penalties are recoverable they can all be recovered in one action, or whether a separate action must be brought for each penalty. I dismiss this part of the case with the simple remark that, irrespective of what was the early common-law rule, or how the question as an original one should be determined upon principle, the rule has been too long considered, settled, and acted upon in this State, that they can all be recovered in one action, to permit any departure from it by this Court."

Chief-Justice Church and Judges Allen and Folger are named as having concurred with Judge Grover. The point is *obiter;* it was clearly not involved in the decision of the case; but four judges went out of their way to state they would not permit any departure from the rule. Judge Rapallo, having been counsel, did not sit. Now, these same four judges cite the brief of Mr. O'Conor as unanswerable authority the other way. Only two matters have been brought forward in their defence—first, the *obiter* character of the opinion; second, the want of analogy between penal actions and indictments. But, as every lawyer knows, there is *obiter* and *obiter*. Where a judge throws out vague hints as to how he might decide some question not before him, neither the judge nor the court are bound; but when a court goes out of its way to announce an inflexible rule in 1871, and in 1875 denies its existence, we may be pardoned for doubting whether its opinions have that weight which those of our Court of last resort ought to have. As to the second point, the analogy between the two kinds of action is expressly laid down by this Court. If the analogy were not sound, it would have been nonsense in the Tweed case to cite Mr. O'Conor's argument from the Johnson case, and declare it unanswerable. On the whole, while we may not agree with Mr. O'Conor as to the dishonesty of the decision, it must be admitted that the opinion might, on the Court's own showing, have just as well been the other way; and if we are to consider with Judge Rapallo the consequences, we very much fear that the effect of this exhibition of judicial inconsistency or recklessness will be quite as bad as any which could come from Tweed's being sent to Blackwell's Island on cumulative rather than separate sentences. To sum up what we have said, the decision in Tweed's case is remarkable, first, because it is declared by the Court to protect the citizen against dangers which it in reality in no way lessens; second, because the Court in it upsets a rule de-

clared by it only four years ago to be in full force; third, because it does this not openly, by citing and overruling its former dictum, but covertly, without mentioning the difficulty at all.

## ENGLAND.

LONDON, July 3, 187 .

THE pendulum of public opinion, which has been oscillating with some regularity between questions affecting the Church and questions affecting the Land, has just taken a great swing Churchwards and seems likely to incline that way for some time to come. And it has been assisted by the present state of political feeling. We are all jaded and dull. The London season is closing, and people are thinking of very little now but of getting out of town and off to Scotland, or to their country-seats, or to the Continent. They are satisfied that the Government is unlikely to do anything especially mischievous or socialistic, and so they leave the Ministerial projects to take their course and to become law or not as the Ministry please. Hence it is that the Agricultural Holdings Bill, of which I wrote some time ago, seems not unlikely to pass into law without any very material change. The leaders of the Liberal party, led away by a will-o'-the-wisp in the shape of a successful election in a Welsh county, were rash enough to believe that the farmers were about to throw off their traditional allegiance to the Tory party, and give their adherence to the miscellaneous hordes which compose the Liberal party. They determined, therefore, most unwisely, as I venture to think—but it is easy to be wise after the event—to fight the most Tory constituency in England with a candidate who proclaimed himself the champion of tenant-right. The result was disastrous. The farmers would not listen to his declarations of hostility against the Ministry or against their Agricultural Holdings Bill, nor to his protestations of friendliness toward themselves. They returned his opponent, a Tory country gentleman and a supporter of the Ministry, by a large majority. The consequence of this election has been that the Agricultural Holdings Bill has been modified in the interests of the landlord; and the opposition to it in the interests of the farmers, which was in a fair way to come to maturity, has died still-born. Unless, therefore, Mr. Trevelyan can excite some feeling in favor of the unenfranchised agricultural laborer next Wednesday when he introduces his bill to assimilate the franchise in counties to that in boroughs, we shall hear very little more of the questions affecting land during the current year. The West Suffolk election has given them their quietus for a season. But, in revenge, the Church questions have risen from their graves, and they are not unlikely to give us a lively time of it for some months.

The day before yesterday, the Public Worship Regulation Act, which created so much excitement during its passage through the House of Commons last session that it had to be tied up for a year, came into operation, and on the same day Mr. Gladstone—who is generally in the thick of it when ecclesiastical storms are threatening or raging—published an article in the *Contemporary Review* with the taking title, "Is the Church of England worth preserving?" urging that the act should, so far as possible, be made a dead letter. The secret history of the act, if it be authentic, is curious. For thirty years and more, the Ritualistic party in the Church, taking advantage of ambiguities in the Rubrics and Liturgy, and of the impotence of the bishops to check their practices, have used every effort to elaborate an ornamental ritual, and, especially in the celebration of the communion, to assimilate the services of the Anglican to those of the Romish Church. So long ago as the end of 1845, when the old Tractarian movement was blossoming into modern Ritualism, it was the occasion of many excited meetings of eager Protestants. In Exeter, a large assemblage in the last days of December of that year passed a resolution denouncing the "known and systematic attempts to bring back the Protestant Church to usages which are associated in the minds of the people with the superstitions and corruptions of Rome." Nothing, however, came of those meetings, and the movement gained strength not only in large towns, where it was comparatively harmless, but even in the remote country places. In 1867, a Ritual Commission was issued, which reported in due time some mild suggestions for settling difficulties, and then for a season the matter dropped. In 1873, an address, signed by 60,000 persons of weight and influence, was laid before the highest dignitaries in the Church, drawing attention to the matter and calling for remedies. But the response to the address contained nothing but soft words and no promise of action. All this time, rumor says that the highest personage in the realm has been sorely troubled and perplexed by the excesses of this Ritualistic party. Frequently has the Bench of Bishops been pressed by no common pressure to introduce some measure to put a stop to these excesses. But during the lifetime of the late Bishop of Winchester, Dr. Wilberforce, this pressure has been delicately ignored, and the measure shelved. Dr. Wilberforce, as you will remember, fell off his horse while riding with Lord Granville in the summer of 1873, and was killed. Some months after this catastrophe, the Ministry of which Mr. Gladstone and Lord Granville were the ruling spirits came to an end, and were succeeded by that of Mr. Disraeli and the Irish Protestant, Lord Cairns. On the 20th of April, a little more than a month after the new Ministry met Parliament for the transaction of business, the Archbishop of Canterbury, with the concurrence of the Bench of Bishops, no longer graced by Dr. Wilberforce, introduced the Public Worship Regulation Bill into the House of Lords. It received the warm support of Lord Cairns, and when it got to the House of Commons Mr. Disraeli took it under his especial protection, and sheltered it with an almost fatherly care from the fierce attacks of Mr. Gladstone. I do not vouch for the truth of this secret history. I give it as it was given to me, stating only that the facts, so far as they are ascertained, seem to bear it out.

The bill, however, is now law, and will shortly be put in operation. It provides, generally, that a churchwarden or any three parishioners of any parish in England or Wales may complain or bring an action against any incumbent for any unlawful alteration he may have made or permitted to be made during the last five years in the fabric of the church, or in its ornaments, or decorations, or furniture; or for the use of any unlawful ornament or vesture within the last twelve months; or for the neglect to use any prescribed ornament or vesture. Action may also be taken against an incumbent who, during the last twelve months, has failed to observe the directions in the Prayer-Book relating to the performance of the services, or who has made any unlawful addition to, alteration of, or omission from any services, rites, or ceremonies. If the complainers and the accused agree, they may have the matter settled by the bishop. If not, the intervention of the archbishop is called for, and he sets in motion the machinery of an ordinary court of justice, presided over by a lay judge especially appointed to try such cases, and who has power to enforce his decision by inhibiting or, if necessary, deposing the incumbent—the bishops and the archbishops by this process abnegating, as the Ritualists say, their spiritual authority, and handing over their jurisdiction to a Parliament-made judge.

The recognized promoters of the bill, and notably the Church Association, are determined that it shall not become a dead letter, whatever Mr. Gladstone may write, or whatever damage they may inflict upon the Church. The *Times* has given the stone its first push by appealing to the Protestant and Philistine instincts of its readers, and inciting them to a vigorous enforcement of the act. The Church Association is preparing, it is said, to help it on its bounding course, and no less than ten London churches have been visited by the agents of the Association with a view to collect evidence for proceedings under the act. From the country, rumors come up to town that churchwardens and parishioners who feel themselves aggrieved by the millinery and the histrionic performances of their clergy, are in earnest consultation as to how they can most effectually have their grievances redressed. Action is slower in country places than in towns, but religious fervor and partisan zeal are more easily inflamed and more persistent. If your clergyman offends you by his eccentricities in a London church, you go over the way to another church that suits you better. But in a country parish you have no such choice. If the patron of the living has settled upon you a person who dresses fantastically, and causes himself to be censed at the communion-table, and sprinkled with holy water; or who causes acolytes and crucifers to make processions and to kneel about him while he rubs their foreheads with black powder from a vessel previously blessed, sprinkled, and censed; or who worships candles and images, and puts up confessional-boxes in your little parish church, and "altar-cards" on the modest communion-table containing invocations to the Virgin Mary, the Twelve Apostles, and a variety of saints and martyrs of the pre-Reformation period—when all or any of these things occur in the wilds of Yorkshire or Somersetshire, where there may not be another church within a Sabbath-day journey of their homes, the hardship to the parishioners becomes intolerable. These things do go on in country parishes, and where this is so, I cannot blame the churchwardens and parishioners for wishing to have them stopped.

But when the war of litigation has once commenced, where will it end? The Ritualists have already shown their hand. A leading member of their body argued last month in the pages of the *Contemporary Review* that the new act having violated one of the principles of the English Constitution (namely, that "ecclesiastical laws are to be administered by ecclesiastical people") and destroyed the legal jurisdiction of the English episcopate, the Ritualistic clergy cannot recognize the new judge and ought not to obey

the new court created by the act. And at most of the Ritualistic churches a long protest against the act has been read, calling upon all true Churchmen—*i.e.*, Ritualistic Churchmen—to refuse to acknowledge a judge and a court born in Erastianism, and nurtured by the abdication of the spiritual rights of the clergy.

It is obvious from the temper in which the various questions connected with this matter are about to be met by both the Low Church and the Ritualists that Mr. Gladstone's well-meant plea for forbearance will be of no effect. The first case that is pressed will open up the floodgates of ecclesiastical rancor, and we shall have a war of recrimination waged with all the vigor of the theological disputes of long ago. The Low-Church party hardly want the *Times* to egg them on. It is a matter of conscience with men of the temperament and convictions of Lord Shaftesbury to put down a form of public worship which they consider hateful to the Almighty and dangerous to the people ; and, having the power, they will be sure to use it. The party assailed will, at first, retaliate. They will attempt to harass their Low-Church brethren by recriminatory actions, with a view to make them conform to the strict letter of the Rubric, which they may, by omission, violate. But this cannot last long. The Protestant party must gradually drive the Ritualists to the wall. They are in a minority, and they have the commonsense of the country against them. Then will come the question of secession and the relinquishment of their benefices. But, as Lord Salisbury said on the second reading of the bill in the House of Lords : "Secession means disestablishing yourself without disestablishing your opponent—it means yielding up vantage-ground." And are the oppressed party in this case likely to follow such a policy ? The Free-Church party did so in Scotland thirty years ago for conscience' sake. But the leaders of the Free-Church party, Chalmers, Guthrie, Candlish, were men of might and of prodigious influence with their followers ; and their followers were men and women who had the example of their Covenanting forefathers before their minds, and who were endowed by nature and tradition with the "perfervidum Scotorum ingenium" —a plant which does not bloom in other nationalities. The English temperament is different. It cannot be directed, like the Scotch, to one consistent and self-sacrificing end. Secession is, therefore, in my opinion, an improbable contingency. Some few of the more determined of the Ritualists may sever connection with the Anglican and throw themselves into the Romish Church. Others may, like Mr. Voysey, become Congregational ministers so long as their congregations can endure them. But the majority will remain in the Anglican Church, conforming outwardly, but inwardly they will help on the crisis of disestablishment, which every day becomes more and more inevitable. Such is my conjecture, for what it may be worth. In corroboration, I may mention this, which I can vouch for as a fact : that at one at least of the more recent Parliamentary elections some of the most zealous supporters of the Liberal candidate were Ritualistic clergymen who, at the general election before the introduction of the Public Worship Regulation Act, were among his most active opponents ; the Liberal candidate, you must remember, having gone a long way towards pledging himself for disestablishment. There is another alternative, but an unlikely one. The Low-Church and the Ritualistic section of the Church may proclaim a truce, on the understanding that they will both assail their common enemy, the Broad-Church section. Even if such an unholy alliance for such unholy ends were possible, it would be but transient. The confederates would inevitably quarrel among themselves, and their divided ranks would then become an easy prey to the solid forces of the Nonconformist and Dissenting bodies, backed as they would be for the destruction of the Anglican Church by the whole Roman Catholic organization.

## MINISTER FALK IN THE RHINE PROVINCES.

BERLIN, July 4, 1875.

THE discussions on the war question have at last come to an end, after the meeting of the Emperors Alexander and Francis Joseph has furnished one more opportunity to the correspondents and article-writers to communicate for the hundredth time to the public their speculations on the signs of the times. Our statesmen have left the dusty and altogether too odorous streets of Berlin, and we may hope that at least during the reign of the dog-star we shall not be haunted by any political spectres of the international species. Yet we do not lack topics for political discussion, and even—if we care for this less savory article—topics for political meditation. The last number of the *Kölnische Zeitung* lies before me. In its telegraphic despatches there is more than a column filled by two reports—I need not say that they are from "special reporters"—on the progress of Dr. Falk in his journey in the Rhenish Provinces. Nothing is forgotten that anybody could possibly wish for. The "special reporters" have even taken good care to let us know when the speakers were rewarded only by an "applause" pure and simple, and when the applause was "continued," or even "stormy," as we Germans say. For a pretty long time now we have been treated to this kind of reading, measured out by the yard with alarming liberality, and you may take it as a sign of the times, and one well deserving to be reflected upon. The name of more than one petty prince is still remembered because Goethe could not refrain from writing down and thereby committing to posterity the interesting fact that he had been "honored" by the visit of his highness. The present generation has certainly a little more self-respect, but even in our day those who do not think it an enviable honor to come within arm's length of any prince are not to be counted by the hundred thousand. Whatever happens at court is in itself important and interesting enough to be telegraphed from one end of the Empire to the other. But whoever heard of such a fuss being made over the journey of a simple Cabinet Minister ! Bismarck in his time has also been the object of some pretty enthusiastic demonstrations, but we were never informed by telegraph how "graciously" and "condescendingly" he received them. And now even Mrs. Falk has become so grand a personage that we have to read morning and evening how she has charmed everybody by her "condescending manner." One cannot help feeling a little uncomfortable when the principal newspapers of a great people begin to feed the public upon such stuff.

Perhaps that would not be worth mentioning if nothing else was blameworthy in these strange proceedings. There are, however, many warm and sincere friends of Dr. Falk and his policy who do not think that such is the case. When the Minister set out on his journey, it was announced that he intended to "study" the Rhenish Provinces, the stronghold of Ultramontanism in Prussia. We beg leave to doubt that it is the best way for a Minister to "study" a province, the great majority of whose population is most decidedly opposed to his policy, by accepting day after day dinners, suppers, and torchlight processions from the minority. Undoubtedly, these demonstrations are not "got up" and "fixed" ; they are tributes voluntarily paid, and we can fully understand, what Dr. Falk repeats in every city, that they gladden his heart to its inmost centre after the mountains of abuse that are daily heaped upon him. Yet he did not go there to refresh his courage and to recuperate his strength, but to "study" the Provinces. It is true, he has repeatedly said how well aware he is of the fact that these demonstrations do not express the feelings of the majority of the population. But is it likely—not to say possible—that the clouds of incense should not turn into a mist before his eyes ? And, certainly, these are times when everybody should wish above all that to his eye the whole atmosphere should be as clear as the purest crystal. But how is that possible, even supposing that these one-sided demonstrations in themselves will not dim his sight in the least ? They cannot but have a great effect upon his adversaries, the great majority of whom constitutes the bulk of the country people. How is it possible that they should put on their everyday faces in view of this unheard-of apotheosis, every detail of which is calculated to press the sting deeper into their sore flesh ? One would suppose, however, that, in order to "study" the Provinces, the Minister would have wished to find everybody exactly with his everyday face.

There is yet another point of view from which the comedy is universally looked upon. The manner in which he receives the marks of cordial sympathy and enthusiastic approbation is perhaps the strongest proof we have as yet been furnished of the fact that in the last ten years public opinion has become an enormous power in Germany. Though we may well rejoice over this fact, it is still a question whether there is any reason to rejoice that it is demonstrated in this manner. Americans should be careful not to answer it from their American standpoint. What is perhaps quite natural and correct in the United States may easily be unnatural and forced, and therefore unhealthy, in Germany. Any American may go on reception-day to the White House and "shake hands" with the President without thereby in the least endangering the foundations of the Republic. But it does not follow that a Prussian Minister is right in meeting every committee who come to express their approval of his policy with the degree of familiarity Dr. Falk has seen fit to adopt for his "Studienreise." A well-known general—a firm friend of the Government's policy towards Rome—said to me the other day, his lips quivering with emotion : "It did not use to be the practice of Prussian Ministers to go roving through the country delivering beer-speeches in every place they happened to pass through." This is stronger language than the occasion calls for ; yet it pointedly expresses what many people think and feel. It would undoubtedly be desirable to have the distance at which perhaps not so much public opinion as public sentiment keeps the members of the Cabinet from the common crowd of mortals, considerably diminished ; but as long as the people view the

Government in the light they do at present, it is of at least doubtful propriety for a Minister not only to suffer such demonstrations, but also to become an active participant in them, by developing and defending his policy at length before these motley audiences. We are too young and inexperienced as a self-acting, political people not to risk something by enticing the Ministers from their high pedestals into the crowd. There is a place where they have to account for what they do, and our representatives and the press are quite sufficient to communicate to them what we think about it. Whenever they allow themselves in any way to be drawn into the arena of the public at large, they are in danger of being suspected of a kind of political agitation which one cannot but deprecate; for, remember, our Ministers are not the leading members of the majority of the Landtag, but the Cabinet of the King. I am far from accusing Dr. Falk of any such designs—he has too high an opinion of the position of a Minister ever to become guilty of playing the part of a common politician—but I think he is damaging his cause, for his course renders it impossible to refute the unjust accusations of his adversaries in an efficient manner. And the press is doing its utmost to aggravate the evil by accompanying with such a deafening flourish of trumpets every compliment paid to the Minister. Who can blame the Ultramontanes for taking it to be the blast of the war-bugle? Certainly, such demonstrations could never have taken place if the fight had not waxed so warm that, on both sides, reason often finds it hard to get the better of passion; and can any one deny that in this struggle it is of the utmost importance for the Minister not only to be, but also to appear, absolutely free from passion?

To make bad worse, a particularly unfavorable moment has been chosen "to fire the heart" of the Ultramontanes. We stand on the eve of the elections for the Landtag in Bavaria, where in the last few years parties have been so evenly balanced that once the accidental absence of a single member of the Liberal party was sufficient to turn the scales in an important vote. If the Ultramontanes should now succeed in electing a majority, be it ever so small, grave consequences may be apprehended, and it is far from unlikely that they will be victorious,* for they will not fail to bring their last man to the ballot-box, while the zeal and the organization of the Liberals leave much to be desired. Perhaps the result of the elections would no longer be doubtful if there were not some dissensions among the Ultramontanes. The official platform of the party promises "faithfulness to the Empire and to the treaties"—*i.e.*, the Treaty of Versailles. Not only all the Liberal parties entertain grave doubts about the sincerity of these promises; they are denounced with great vehemence by the radical wing of the Ultramontanes themselves. What these irreconcilables aim at may be seen from the following declaration in the *Amberger Volksblatt:* "They hate us Catholics, they want to annihilate and Lutheranize us—that is evident from all the manœuvres of the Liberals. So the present campaign is evidently a religious struggle. Protestants, Jews, Old-Catholics, New Heathens, against Catholics! The election agitation has this time an easy game; our whole programme is: defence of our holy faith." This language the Bavarian peasant, to whom it is addressed, understands, and he will not leave it unheeded. Only a part of those who, under the Crown Prince, have stood by the side of the Prussians on many a hard-won battle-field in France, may take exception to it, and the more so because care is taken to inform them how the French press glories in it, while it rebukes, in a tone of paternal grief, the weak-kneed and unprincipled concessions in the official platform. If the number of veterans in whom these recollections are still of sufficient force to render the instigations of the priests vain were insignificant, we should be sure of not finding those concessions in the platform. Whether they will suffice to deceive those unsophisticated minds about the true ends of the real leaders of the party, we shall soon know. But of one thing we already feel quite sure: much as we should regret a victory of the Ultramontanes, yet the worst fruits it would bear would be to the Ultramontanes themselves. It is not likely that the moderate wing would be able to secure the leadership to themselves, while, with the peculiar position of Bavaria in the Empire, it is not impossible that the radical faction might succeed in infusing such a strength into the Opposition, and giving it such a character, that we should find ourselves unable to proceed by legal means in the work of building up the Empire. But if it comes to that, we shall remember that in 1866 the corner-stone of the Empire was laid by a revolution, and neither the author of this one nor the mass of the people will hesitate to finish the work by another revolution, if it cannot be done otherwise. If the leaders of the Ultramontanes are not quite blindfolded by passion, let them pause and open their eyes, and they must become convinced that the work of the last ten years cannot be undone. If they should ever attempt to do it, they would only bring about a crisis, the effect of which would be to finish by one violent stroke what should be the result of a slow and peaceful development.

* They have, in fact, obtained a majority of three.—Ed. Nation.

# Notes.

J. SABIN & SONS have put everybody but collectors under an obligation by reproducing in fac-simile the veteran Cruikshank's 'My Sketch-Book,' a work now among the hardest to obtain, and yet one of those most sure to live as the product of a rare genius. All of the artist's characteristics are present in these etchings, and some of the examples, both of his fun and of his sentiment, are among the highest efforts of his pencil. For the period 1834-36 these sketches are as good as so many fashion-plates. ——Mr. Longfellow's "Morituri salutamus" was being delivered about the time when Adolf Starr was proving in Westermann's *Illustrirte deutsche Monatshefte* that the "Ave Imperator, morituri te salutant" was probably an invention of Dion Cassius or of unsupported tradition. The naumachia which this author describes when introducing the phrase had also been described by Tacitus and Suetonius, who were both silent as to the incident. But, *ben trovato* or not, nothing can now deprive the world of this useful counter.——The *Athenæum* for July 17 contains a full and appreciative notice of the late John Elliot Cairnes, and supplies the dates about which we were doubtful. Prof. Cairnes was born at Drogheda in 1824. ——Some person who should have known better sent us, with the usual evidences both of good faith and of culture, a pretended quotation from Polydore Vergil which we printed as a Shaksperian parallel in No. 506 of the *Nation*. We have since learned it to be a forgery, and must warn all commentators off from it.——The fifteenth annual meeting of the National Educational Association will be held in Minneapolis on August 3, 4, and 5. The railroads have generally consented to a reduction of rates for those wishing to attend.——We should set most value on the portrait of Corot in the illustrations of the *Art Journal* for July (D. Appleton & Co) The wood-cuts from his paintings, however, seem rather inadequate. There are, besides more of Landseer's sketches, a continuation of the admirably engraved views along the Hudson, and an instructive paper by Sir Rutherford Alcock on "Japanese Art," with numerous examples.——The etchings in the July *Portfolio* (J. W. Bouton) are a landscape after Crome, and a Persian warrior after Etty, each striking in its way. The photogravure is of sheep, after a painting by Rosa Bonheur, and is accompanied by a brief sketch of this artist's career by René Ménard. The metaphysical article, "Some Characteristics of Artistic Movements," is by G. A. Simcox.

—*Lippincott's* for August contains a number of readable but no very striking articles. The illustrated paper by Cecil Buckland, describing a two weeks' journey from Bayonne to Estella and back, falls a good deal short of the possibilities of the subject. What is most valuable in it is its account of the unwarlike aspect of the Carlist territory: "Cultivation went on as usual, and the soil is so fertile that, although the troops may sometimes be kept waiting for their pay, there does not seem much chance of their running short of provisions. . . . Another reason why the agricultural productions of the country have not decreased since the war is found in the fact that the women do much of the field-labor. The food of the inhabitants is simple enough: meat is cheap, and their little farms yield them three, and sometimes four, crops in the year." There is a well-written and light but suggestive article on the modern constitutions of France, by E. C. Grenville Murray; and we have read also the probable story of "Frau Sommer's Pleasure-trip," in which the heroine gets herself into a mad-house under circumstances which would hardly have disconcerted one of our countrywomen in her station, more travelled, more independent, and less nervous. In the "Monthly Gossip," two subjects, the tercentenary of the University of Leyden and the flowers of Paris, are treated in an interesting manner; and the argument in favor of abolishing conspicuous and individual monuments in our city cemeteries is worth considering in connection with Mr. Haden's efforts to make the disposal of the dead less burdensome and offensive to the survivors.

—The October number of the *Historical and Genealogical Register* will be devoted to a history of the Centennial celebrations of the current year in New England. The number for July, meantime, will be found unusually attractive. The customary steel portrait is of the late Judge Timothy Farrar, whose career is briefly sketched. He was a law partner of Webster's in Portsmouth, N. H., and he reported the famous Dartmouth College case. To the list of his writings for the periodicals given by his biographer we can add his contribution to the *Nation* on "The Suffrage and

the Constitution," printed on page 233 of Vol. I. A blood-relationship between Gibbon, the historian, and Jefferson, through the Randolphs of Virginia, is discussed by Abram E. Cutter, and is made plausible enough to warrant further enquiry. Dr. Hiland Hall describes very clearly the origin of the mistake by which Vermont was reported in the census of 1790 as containing 16 slaves, although the constitution of 1777, with which the State came into being, expressly prohibited slavery. This error was discovered in time to prevent its reappearance in the census of 1870. What is curious about it is that it arose from an attempt on the part of the marshal of Bennington County to classify the free blacks more minutely than the schedule called for. The 15 females thus set down in a column appropriated to another heading were converted by the compiler of the census into 16 slaves, and in subsequent censuses the number somehow grew to 17. Mr. Charles W. Tuttle announces that he shall furnish proof that the State of Maine derived its name from its coast having been referred to as "The Mayne," and not from the province of Maine in France. Several important genealogies are printed in the *Register*—Marcy, Alger, Peirce, etc.; and a useful list of portraits and busts in possession of Brown University and of the Providence Athenæum continues a scheme which was begun in the number for October, 1874, with a catalogue of the busts and portraits in the State House at Concord, N. H., and the Phillips Exeter Academy, and which will be continued for other institutions and public galleries, with a view to completeness.

—The appearance of the seventh edition of Bartlett's 'Familiar Quotations' (Little, Brown & Co.) raises afresh the interesting question, What is a familiar quotation? We have not at hand the sixth edition of this standard work, but we infer that it was not revised upon the fifth, and that the present one contains the changes and additions which have occurred to the editor since 1868. The result is a volume larger by nearly seventy pages than its immediate predecessor; to Shakspere alone, for example, "more than three hundred lines have been added." Doubtless we cannot infer in his case that the newly-recorded household words have become "familiar" in the past seven years, any more than in the case of Lady Dufferin's "I'm sitting on the stile, Mary," which had no place in the sixth edition. Or shall we say that Mr. Emerson's prose must have gained readers and admirers in the same period, because nearly a page of it is now inserted for the first time? The "heathen Chinee" obtains probably as early an admittance as was possible; but Lowell's "Crisis" and "Biglow Papers," first series, and "Zekle crep' up quite unbeknown" have been made, we should say, to undergo a little seasoning. The same may be remarked of Tennyson's "I held it truth with him who sings," and the "Charge of the Light Brigade," and "O good gray head which all men knew." On the other hand, an added stanza from Whittier's "Lines on Burns" may be deemed to fall in the first rather than in the second category of which the compiler speaks when he says (advertisement to the fourth edition), speaking of various happy sayings which ought to be familiar: "To admit these simply on their own merits, without assurance that the general reader would readily recognize them as old friends, was aside from the purpose of this Collection." But after all, the compiler is and must be the only arbiter, and the longer his collection is prized as this one is by the public, the more his judgment will be justified, for he will have made familiar what was not so before; and as Mr. Bartlett omits nothing in his successive editions, or, in other words, does not attempt to discriminate between now current and lately or once current quotations, he keeps familiar what was in danger of becoming obsolete. Originally chiefly a collection of poetical quotations, making a choice anthology of the English language, the work has little by little invaded the domain of prose, and the most interesting additions to the present edition are in the latter department. Among the proverbial expressions (conveniently arranged by alphabet) we notice for the first time "Mad as a March hare" and the "Music of the spheres"; while by entering "Eternal vigilance is the price of liberty" and "Lost to sight to memory dear" with the statement "author unknown," Mr. Bartlett seems to invoke the aid of the curious in discovering the proper authors of these sayings. It is odd to find "Dead as Chelsea" an English expression, referring to Chelsea Hospital, and more than a hundred years old at that. In Boston, it has been used for time out of mind in contemptuous allusion to a neighboring city; just as in Lynn they have a habit of saying "as dead as Saugus."

—Whatever New York may be doing respecting her new "musical establishment," London is taking some energetic strides towards the settlement of a National Training School for Music. Some time back the promoters of this new auxiliary to the Department of Science and Art, headed by the Duke of Edinburgh (himself a violinist and composer), essayed to fuse their project with the existing Royal Academy of Music. But the Royal Academy, somehow or other, has always been reputed as of a jealous and exclusive temperament, and is wedded to its own peculiar views about extending musical education to "the people." So the Duke and his coadjutors, foremost among these being the untiring Sir Henry Cole, returned to South Kensington, and resolved by themselves to found a National School of Music under the shadow of the great Albert Hall, with its concert-rooms and theatre, which will serve as the *locus in quo* of the public performances of the school. To their aid seasonably enough has come Mr. Freake, the builder, who has built and owns many of the sumptuous residences in the South Kensington quarter of London. This gentleman is induced to build for the Association a training school, specially designed and fitted for their use; he next presents the edifice as a gift; and his wife, who is well known in London musical coteries, agrees to found one of the first scholarships of the institution. On June 13, the whole scheme was ripened for public acceptance by a meeting at Marlborough House, the residence of the Prince of Wales, and, he himself being present and in the chair, we read that there were "two archbishops, two royal princes, the Lord Mayor and leading members of the corporation, all advocating the civilizing influence of music and the necessity of providing for adequate tuition, so that no incipient indication of ability for the science of sweet sounds should not be at once turned to the best account." Since then Sir Michael Costa, Sir Julius Benedict, Sir George Elvey, Herr Hallé the pianist, and Professors Ella and John Hullah, both at the head of the musical profession in England, have been appointed to examine into the progress and working of the new training school. Finally, at a conference at the Mansion House, the Lord Mayor presiding, a committee was appointed to make arrangements for the forthcoming public meeting in connection with the proposed school. Sir Henry Cole announced that it was contemplated that there should be 300 scholarships of £40 a-year each, to be tenable for five years, though they would probably have to be content with 50 or 100 scholarships for the first twelve months.

—The merchants of the Nile, according to the African traveller, Dr. Nachtigal, are opening up the interior of the kingdom of Wadai, lately accepted as a tributary of Egypt, and the whole of the country will probably be accessible to foreign traders within the next few years. The *Pall Mall Gazette*, in abridging the traveller's interesting account of his experiences, laid before a meeting of the Berlin Geographical Society, describes the king's rule as extending far beyond the limits of his own country, and comprising the numerous desert tribes up to the land of the Niam-Niams. The area of his territory is about three thousand square miles, and the population Dr. Nachtigal estimates at about 2,500,000. The ground rises from east to west, and attains an elevation of from 1,000 to 1,500 feet above the sea-level. The religion of the people is Mohammedan, and their customs resemble those of most uncivilized Mohammedan countries. The king is looked upon as a sort of divinity; his mother must be of the dominant race; he must be without any physical or mental defect, always eat alone, and never drink beer. The king's drinking-vessels, and the wells from which they are filled, are covered with cloths, to protect the water against the influences of the evil eye, and the women and girls who take the water to the king's palace are always accompanied by a guard. The royal insignia are a crown, a sun-umbrella of ostrich feathers, and the family Koran. The king's harem consists of about five hundred women, and when the king dies his daughters are married at the expense of his successor; the sons, except the heir to the throne, being blinded with hot irons. The highest dignitaries of state, when they are summoned to appear before the king, always approach him on all-fours, with downcast eyes. The administration of the country is entirely in the hands of the officials, who are taken mostly from certain privileged families. A separate and generally despised class, though for what reason does not appear, is formed by the smiths. To call a man a smith in Wadai is an insult which can only be atoned for by blood. They have a sort of king, who has to shave the real king's head once a week. This "king of the smiths" is also the surgeon of the harem, and performs the operation of blinding the king's relatives on his accession. One of the most profitable of the appointments in the civil service is that of "searcher." The duty of this official is to look for beer-drinkers. He has a number of spies under his orders, who go into each house to seek the forbidden liquor, and every man on whose premises it is found is liable to have his whole property confiscated and his wife's head shaved. Generally, however, the "searcher" is satisfied by the payment of a heavy fine. The taxation of the country is very heavy. Of every ten fish that are caught, eight have to be given to the king; he also gets as taxes every three years about 200 cwt. of ivory, 4,000 slaves, 5,000 camels, and 10,000 cattle. All the horses born in the country which are not required for breeding belong to the king, besides which he receives large contributions of skins, mats,

honey, rice, ostrich and guinea-fowl eggs, water-jars, butter, and salt. The king is the judge in all criminal cases affecting the royal family and the higher officials. Murderers are usually given up to the families of their victims, who may either accept compensation (usually consisting of 100 camels and 100 horses) or take the murderer's life. Theft is punished the first and second times with a fine, and the third time with death. The sentence in such cases is executed by the king's musicians. The penalty of death by shooting is inflicted on the higher officials only; other malefactors are either strangled or impaled. The army consists of 40,000 infantry and 5,000 to 6,000 cavalry. A third of the latter wear armor; and although there are 4,000 muskets in store, only 1,000 of the troops know how to use them. In time of war the army is divided into three detachments, with the king in the middle. The battle is fought by the two wings, and when it ends unsuccessfully the king sits down on a carpet and calmly awaits his fate.

—We have just received the first number of the second volume of the *Rivista di Filologia Romanza*, the first volume of which we noticed in the *Nation*, No. 494. The present number is of special interest to students of old Italian literature, containing among other articles two *Devozioni* of the first half of the XIVth century. These *Devozioni* are dramatic compositions which were represented in the church, the first upon Thursday of Holy Week, the second on Good Friday, and are of the highest importance for an understanding of the development of the Italian sacred drama. The four steps were: the liturgic dramas, the *Laude*, the *Devozioni*, and the *Sacre Rappresentazioni*. Five of these *Laude* are given in the Review in a continuation of the article on "Uffizj Drammatici dei Disciplinati dell' Umbria." Karl Bartsch contributes a didactic poem of the XIIIth century, taken from the Vatican MS. 4476, with valuable annotations by Mussafia, and there are, besides, a description of the Provençal *Canzoniere* which belonged to the late Sir Thomas Phillipps, of Middlehill, reviews of works relating to Italian philology and literature, and contents of the various periodicals devoted to the Romance languages.

## SWINBURNE'S ESSAYS.*

MR. SWINBURNE has by this time impressed upon the general public a tolerably vivid image of his literary personality. His line is a definite one; his note is familiar, and we know what to expect from him. He was at pains, indeed, a year ago to quicken the apprehension of American readers by an effusion directed more or less explicitly to themselves. This piece of literature was brief, but it was very remarkable. Mr. Emerson had had occasion to speak of Mr. Swinburne with qualified admiration, and this circumstance, coming to Mr. Swinburne's ears, had prompted him to uncork on the spot the vials of his wrath. He addressed to a newspaper a letter of which it is but a colorless account to say that it embodied the very hysterics of gross vituperation. Mr. Swinburne has some extremely just remarks about Byron's unamenableness to quotation, his having to be taken in the gross. This is almost equally true of our author himself; he must be judged by all he has done, and we must allow, in our judgment, the weight he would obviously claim for it to his elaborate tribute to the genius of Mr. Emerson. His tone has two distinct notes—the note of measureless praise and the note of furious denunciation. Each is in need of a correction, but we confess that, with all its faults, we prefer the former. That Mr. Swinburne has a kindness for his more restrictive strain is, however, very obvious. He is over-ready to sound it, and he is not particular about his pretext. Some people, he says, for instance, affirm that a writer may have a very effective style and yet have nothing of value to express with it. Mr. Swinburne demands that they prove their assertion. "This flattering unction the very foolishest of malignants will hardly, in this case [that of Mr. D. G. Rossetti], be able to lay upon the corrosive sore which he calls his soul; the ulcer of ill-will must rot unrelieved by the rancid ointment of such fiction." In Mr. W. M. Rossetti's edition of Shelley there is in a certain line an interpolation of the word "autumn." "For the conception of this atrocity the editor is not responsible; for its adoption he is. A thousand years of purgatorial fire would be insufficient expiation for the criminal on whose deaf and desperate head must rest the original guilt of defacing the text of Shelley with this most damnable corruption."

The essays before us are upon Victor Hugo, D. G. Rossetti, William Morris, Matthew Arnold as a poet, Shelley, Byron, Coleridge, and John Ford. To these are added two papers upon pictures—the drawings of the old masters at Florence and the Royal Academy Exhibition of 1868. Mr. Swinburne, in writing of poets, cannot fail to say a great many felicitous things. His own insight into the poetic mystery is so deep, his perception in matters of language so refined, his power of appreciation so large and active, his imagination, especially, so sympathetic and flexible, that we constantly feel him to be one who has a valid right to judge and pass sentence. The variety of his sympathies in poetry is especially remarkable, and is in itself a pledge of criticism of a liberal kind. Victor Hugo is his divinity—a divinity whom indeed, to our sense, he effectually conceals and obliterates in the suffocating fumes of his rhetoric. On the other hand, one of the best papers in the volume is a disquisition on the poetry of Mr. Matthew Arnold, of which his relish seems hardly less intense and for whom he states the case with no less prodigious a redundancy of phrase. Matthew Arnold's canons of style, we should have said, are a positive negation of those of Mr. Swinburne's, and it is to the credit of the latter's breadth of taste that he should have entered in to an intellectual temperament which is so little his own. The other articles contain similar examples of his vivacity and energy of perception, and offer a number of happy judgments and suggestive observations. His estimate of Byron as a poet (not in the least as a man—on this point his utterances are consummately futile) is singularly discriminating; his measurement of Shelley's lyric force is eloquently adequate; his closing words upon John Ford are worth quoting as a specimen of strong apprehension and solid statement. Mr. Swinburne is by no means always solid, and this passage represents him at his best:

"No poet is less forgettable than Ford; none fastens (as it were) the fangs of his genius and his will more deeply in your memory. You cannot shake hands with him and pass him by; you cannot fall in with him and out again at pleasure; if he touch you once he takes you, and what he takes he keeps his hold of; his work becomes part of your thought and parcel of your spiritual furniture for ever; he signs himself upon you as with a seal of deliberate and decisive power. His force is never the force of accident; the casual divinity of beauty which falls, as though direct from heaven, upon stray lines and phrases of some poets, falls never by any such heavenly chance on his; his strength of impulse is matched by his strength of will; he never works more by instinct than by resolution; he knows what he would have and what he will do, and gains his end and does his work with full conscience of purpose and insistance of design. By the might of a great will seconded by the force of a great hand he won the place he holds against all odds of rivalry in a race of rival giants."

On the other hand, Mr. Swinburne is constantly liable on this same line to lapse into flagrant levity and perversity of taste; as in saying that he cannot consider Wordsworth "as mere poet" equal to Coleridge as mere poet; in speaking of Alfred de Musset as "the female page or attendant dwarf" of Byron, and his poems as "decoctions of watered Byronism"; or in alluding jauntily and *en passant* to Gautier's 'Mademoiselle de Maupin' as "the most perfect and exquisite book of modern times." To note, however, the points at which Mr. Swinburne's judgment hits the mark, or the points at which it misses it, is comparatively superfluous, inasmuch as both these cases seem to us essentially accidental. His book is not at all a book of judgment; it is a book of pure imagination. His genius is for style simply, and not in the least for thought nor for real analysis; he goes through the motions of criticism, and makes a considerable show of logic and philosophy, but with deep appreciation his writing seems to us to have very little to do. He is an imaginative commentator, often of a very splendid kind, but he is never a real interpreter and rarely a trustworthy guide. He is a writer, and a writer in constant quest of a theme. He has an inordinate sense of the picturesque, and he finds his theme in those subjects and those writers which gratify it. When they gratify it highly, he conceives a boundless relish for them; they give him his chance, and he turns-on the deluge of his exorbitant homage. His imagination kindles, he abounds in their own sense, when they give him an inch he takes an ell, and quite loses sight of the subject in the entertainment he finds in his own word-spinning. In this respect he is extraordinarily accomplished: he very narrowly misses having a magnificent style. On the imaginative side, his style is almost complete, and seems capable of doing everything that picturesqueness demands. There are few writers of our day who could have produced this description of a thunder-storm at sea. Mr. Swinburne gives it to us as the likeness of Victor Hugo's genius:

"About midnight, the thunder-cloud was full overhead, full of incessant sound and fire, lightening and darkening so rapidly that it seemed to have life, and a delight in its life. At the same hour, the sky was clear to the west, and all along the sea-line there sprang and sank as to music a restless dance or chase of summer lightnings across the lower sky: a race and riot of lights, beautiful and rapid as a course of shining Oceanides along the tremulous floor of the sea. Eastward, at the same moment, the space of clear sky was higher and wider, a splendid semicircle of too intense purity to be called blue; it was of no color namable by man; and midway in it, beween the stars and the sea, hung the motionless full moon; Artemis watching with serene splendor of scorn the battle of Titans and the revel

* 'Essays and Studies. By Algernon Charles Swinburne.' London: Chatto & Windus. 1875.

of nymphs from her stainless and Olympian summit of divine indifferent light. Underneath and about us, the sea was paved with flame ; the whole water trembled and hissed with phosphoric fire ; even through the wind and thunder I could hear the crackling and sputtering of the water-sparks. In the same heaven and in the same hour there shone at once the three contrasted glories, golden and fiery and white, of moonlight, and of the double lightning, forked and sheet ; and under all this miraculous heaven lay a flaming floor of water."

But with this extravagant development of the imagination there is no commensurate development either of the reason or of the moral sense. One of these defects is, to our mind, fatal to Mr. Swinburne's style ; the other is fatal to his tone, to his temper, to his critical pretensions. His style is without measure, without discretion, without sense of what to take and what to leave ; after a few pages, it becomes intolerably fatiguing. It is always listening to itself—always turning its head over its shoulders to see its train flowing behind it. The train shimmers and tumbles in a very gorgeous fashion, but the rustle of its embroidery is fatally importunate. Mr. Swinburne is a dozen times too verbose; at least one-half of his phrases are what the French call phrases in the air. One-half of his sentence is always a repetition, for mere fancy's sake and nothing more, of the meaning of the other half—a play upon its words, an echo, a reflection, a duplication. This trick, of course, makes a writer formidably prolix. What we have called the absence of the moral sense of the writer of these essays is, however, their most disagreeable feature. By this we do not mean that Mr. Swinburne is not didactic, nor edifying, nor devoted to pleading the cause of virtue. We mean simply that his moral plummet does not sink at all, and that when he pretends to drop it he is simply dabbling in the relatively very shallow pool of the picturesque. A sense of the picturesque so refined as Mr. Swinburne's will take one a great way, but it will by no means, in dealing with things whose great value is in what they tell us of human character, take one all the way. One breaks down with it (if one treats it as one's sole support) sooner or later in æsthetics ; one breaks down with it very soon indeed in psychology. We do not remember in this whole volume a single instance of delicate moral discrimination—a single case in which the moral note has been struck, in which the idea betrays the smallest acquaintance with the conscience. The moral realm for Mr. Swinburne is simply a brilliant chiaroscuro of costume and posture. This makes all Mr. Swinburne's magnificent talk about Victor Hugo's great criminals and monstrosities, about Shelley's Count Cenci, and Browning's Guido Franchesini, and about dramatic figures generally, quite worthless as anything but amusing fantasy. As psychology it is, to our sense, extremely puerile ; for we do not mean simply to say that the author does not understand morality—a charge to which he would be probably quite indifferent ; but that he does not at all understand immorality. Such a passage as his rhapsody upon Victor Hugo's Josiane ("such a pantheress may be such a poetess," etc.) means absolutely nothing. It is entertaining as pictorial writing—though even in this respect, as we have said, thanks to excess and redundancy, it is the picturesque spoiled rather than achieved ; but as an attempt at serious analysis it seems to us, like many of its companions, simply ghastly—ghastly in its poverty of insight and its pretension to make mere lurid imagery do duty as thought.

## THE NORTH AMERICAN REVIEW FOR JULY.

IN a paper on Geographical Surveys, Prof. J. D. Whitney gives, in a popular form, a great deal of valuable information as to the progress of topography in this and other countries. The general law of topographical progress which he lays down is very simple, namely—that the minuteness and accuracy of surveys in any country will depend ultimately on the value of the country to man ; *i.e.*, very rough surveys are all that we need expect of lands which are unfit for man's habitation ; while the importance of having thorough surveys increases directly with every increase of use to which land can be put. For the general survey of Great Britain known as the "Ordnance Survey" two scales were selected, one of six inches and the other of one inch to the mile ; but the map of London is on the scale of five feet. This law, applied to America, would lead us to expect to find that the work had been very roughly done in some directions, and would over a great part of the country be hardly even worth doing at all, while large portions of it ought to be very minutely and accurately known. The law, however, does not work of itself, and in this country there have been certain human causes, chiefly the ignorance of politicians, which have prevented its working smoothly. We find, indeed, that though a great deal of money has been spent on topography, much of it has been spent without system, and the result is now a sort of chaos of surveys carried on by different bodies under different authority, without any common object or plan of operations. We have, it is true, in the Coast Survey a work which is highly creditable to American science, and which has been in progress, with an interruption of sixteen years, since 1801. This survey was originally intended, of course as its name implies, for the coast alone, but fortunately for us the remarkably indented character of our coast has made it necessary to triangulate a good deal of the interior also, and thus we have, in the case of some States, like New Jersey and Maryland, no small portion of their topography given accurately. The Coast Survey now receives from Congress an annual appropriation for extending its work "so as to form a geodetic connection between the Atlantic and Pacific coasts." If in the end the whole interior were to fall into its hands, no one who has the interest either of science or the country at heart would be sorry. Besides the Coast Survey, however (which is attached to the Treasury Department), there is a Lake Survey carried on under the War Department—why separated from the Coast Survey it would probably be difficult to discover ; and then there are also the Land-Office surveys, carried on by the Interior Department, the work of which is done, according to Professor Whitney, with "the simplest and least accurate instruments" and without any triangulation. The result of this is that the work is badly done, and it will, as Professor Whitney says, be apt to excite some surprise, in any one who reads the Land-Office report that the guide meridians and standard parallels are "run, as nearly as human skill can effect it, upon true meridians and parallels of latitude," to learn that in truth portions of these lines are miles away from where they ought to be. The work, it seems, will have to be done over again. Besides this, the Engineer Bureau has done much topographical work, and has nominally the credit of Mr. King's excellent Fortieth Parallel Survey ; and there is also a survey of the Territories, under charge of Dr. F. V. Hayden and Mr. J. T. Gardner, his assistant ; and a survey of the Colorado River, which has been going on for about five years, first under the Department of the Interior, and afterwards under the Smithsonian Institution. These last two surveys cover in a great measure the same ground, but there is still a third, under the direction of the Engineer Bureau, known as Lieutenant Wheeler's Survey. Such is the very confused condition of affairs (we have left out of consideration the various State surveys), and it is obvious that they are not in the condition they ought to be. The Government—that is to say, Congress and the Executive—have plainly no idea of what is wanted, and no notion of the means by which it is to be carried out, and the work has accordingly fallen into the hands here of a good man, there of a bad one, the amount of appropriations depending very much on his demands, and the direction of his explorations being very much left to himself to determine. What is now wanted is the introduction of order and system under a single head.

The third chapter of the Adams-Wingate history of the Ring brings the tale of that remarkable body down to the publication in the *Times* of the fraudulent accounts, and in the next instalment we shall hope to have the question as to who destroyed the Ring definitely settled. The present instalment carries us back to the time when the Ring had actually got possession of the city, after Hall had given the Public Works to Tweed, the Comptrollership to Connolly, and the Parks to Sweeny. Some of the incidents of that time, when they are now recalled, seem to be fairly incredible. The order issued by Hilton to have the zoölogical models put up in the Park by Professor Hawkins carted away and buried, and to have his moulds and sketch-models destroyed, on the ground that a naturalist ought not to waste his time on "dead animals" when there were so many live ones to be cared for ; the report on the Palæontological Museum issued by Sweeny, referring to animals "alleged to be of the pre-Adamite period," and introducing a new system of classification by mentioning one department as being devoted to "carnivora" and another to "the wolves and bears" ; the certificate of John Jacob Astor and five other men of substance to the "faithful and correct manner" in which the Comptroller was managing the financial affairs of the city, and their encouraging announcement that owing to this faithful discharge of duty the city debt would be "extinguished in less than twelve years"—in recalling these things, it is difficult to persuade one's self that they are not taken from some burlesque or opéra-bouffe rather than from the real history of an American city.

We have already referred to the article by Mr. Henry Reed on "Some Recent Efforts at Constitutional Reform," besides which the *Review* contains an interesting discussion of Todhunter's 'Conflict of Studies' by Chauncey Wright, and a sensible discussion of the æsthetic works of Pater, Rio, and Burckhardt, by Mrs. Wister. The extreme "gush" of the first of this trio is better brought out by Mrs. Wister than it has been by any one before.

*Fears for Democracy regarded from the American Point of View.* By Charles Ingersoll. "La liberté est un aliment de bon suc mais de forte digestion ; il faut des estomacs bien sains pour le supporter" (J. J. Rousseau). (Philadelphia : J. B. Lippincott & Co. 1875. 8vo, pp. 297.)—We cannot quite make out Mr. Ingersoll's object in writing this book, unless it was to put on record his opinion that the agitation against slavery was unjustifiable, the late war uncalled for, the Reconstruction Acts outrageous, and our present political practices harmful and dangerous. The following sentence contains, if we read it aright, much of the gist of the book, and is moreover a fair specimen of its style :

"Negro slavery, the vile pretence of which the South had been so long the victim—and no giddy-headed prince ever invaded his neighbor's dominions on falser pretences than those on which we gave the South no rest—found, and left, after all the agitation of it, in the people of the non-slaveholding States, a feeling as true to the slaveholders as to themselves ; but instantly the cry was war when the affront came at Fort Sumter" (p. 218).

Mr. Ingersoll does not propose any remedy for our present evils ; nor does he anywhere trace out their causes, except by referring them in a vague way to the neglect of democratic principles. What these democratic principles are he does not tell us ; but he ought to know—and, in fact, shows on page 115 that he does know—that there is more than one type of democracy, and that "in French democracy unfortunately the Government does everything." Here is a glimpse of an important truth ; so, too, on page 122, he hits precisely the great defect in our institutions—that "we have a government that answers to itself and not to the people ; a government without responsibility." There are many judicious observations scattered through the book, and in particular there is a carefully prepared account of the manner in which our Executive Department was wrought out in the Constitutional Convention ; but as a whole the book lacks coherence.

"If from the people of the United States were withdrawn, at the same moment, the Federal and State establishments, with all their appliances and means of compulsion, and we were left with no governments at all, ruin would not ensue ; the best portions of society would appear, and the worst, those who are now uppermost, politically, would disappear, exactly as in Europe the worst would appear and the best disappear" (p. 86). There is no proof offered of this prophecy, but, granting it to be well founded, whose fault is it that at present it is the worst portions of society that are uppermost with us ? Surely, democracy—meaning, as Mr. Ingersoll appears to mean, Jeffersonian democracy, as embodied in the Democratic party—can never expect a fairer field and a better chance than it has had in this country, which it ruled almost without interruption from 1801 to 1861. Where else, then, can the responsibility rest ?

*The Art of Swimming in the Eton Style.* By "Sergeant" Leahy (New York : Macmillan & Co. 1875.)—If the literary editors of this little volume had done their duty, we might have had a coherent and orderly account of what is meant by the "Eton College style," but we should have had fewer pages to read, and should have missed the very amusing acquaintance of Sergeant Leahy. We certainly "appreciate it as a great boon" that after teaching Eton schoolboys to swim for a guinea, and the ladies of the neighborhood of the first class at two shillings a lesson, the inventor of the "style" in question freely makes it over to the public, with the assurance that "it is the best in the world, and admits of no improvement." We are not going to describe it here, since we wish Sergeant Leahy to have the full benefit of his entertaining publication. A few sentences which we quote at random will, without revealing too much, give some idea of his capacity as a teacher. "When you feel cramp coming on, don't attempt to stop or stand, but strike out much faster than before ; a sudden jerk is the most effective thing." "In order to make way against a rapid stream, current, or tide, which would otherwise carry you away, you should dive every now and then, taking a fresh breath ; for the current has less power over you when you swim under water than when you swim above it." "If you do not believe it is the legs which propel a swimmer when on his belly, you surely will believe it is the legs that do it when he is on his back, with his hands on his hips. I say again, put more reliance in your legs, and they will not fail you as the arms will." "How long will people be content to take only half-measures for the introduction of thorough teaching in the art of swimming ? I ask, is it or is it not necessary for them to be followed up until proficiency is obtained in this as in other games, the practising of which is carried to such an extent that this, the most necessary of them all, is comparatively neglected, and only taken up by the few ?"

*TO PROPRIETORS AND TEACHERS OF SCHOOLS.*

Conductors of schools, in making their arrangements for the ensuing year, will find it very much to their interest to consider the special advantages for reaching parents and pupils afforded by THE TRIBUNE. It has long been acknowledged to be the best means of communication between schools and those seeking them. Its great advance in circulation now makes its superiority more marked than ever.

With but a single exception (that of a paper not circulating largely among the educated classes, and never having many school advertisements), THE TRIBUNE has the largest daily circulation of any quarto paper in the United States. Its aggregate circulation is much larger than that of any other ; and its semi-weekly and weekly circulations are double and treble those of the rivals which come nearest it. These facts have been sustained by the amplest evidence, are certified by the largest advertising agents, and have not been disputed even by rivals.

All advertisers agree that the value of the medium by which they address the public depends not less on the character than the extent of its circulation. The combined test makes the great superiority of THE TRIBUNE still more manifest. No other journal has so large and rapidly-increasing a constituency among the educated classes. No other is so widely and thoroughly read in the higher schools and colleges. No one now disputes with THE TRIBUNE the distinction of specially representing among newspapers the educational progress of the times. Its pre-eminence in these regards was so well understood among educators last year that the school advertisements in its columns exceeded in number and value the aggregate of those in all the other morning papers of New York.

In the community at large, TRIBUNE readers are found always in those families of culture and means from which pupils of schools not supported by taxation mainly come. In no way can the heads of these families be so effectively and directly reached as through the columns of THE TRIBUNE. It is of especial value to first-class schools because of the wide region of country it covers, as well as its large number of subscribers. In New York it has the largest circulation among the best classes. Outside New York the returns of postage, furnished by the Post-office Department, show that its regular circulation is out of sight ahead of any rival. These out-of-town subscribers are nearly all among well-to-do people, the very best patrons of schools. The Daily, in the country, goes generally to bankers, business men, professional men, and wealthy citizens who have retired from business. The Semi-weekly has a very choice circulation (four times that of any other semi-weekly in the United States), mainly among the same classes, at points where they do not have a daily mail, or where they depend on papers nearer home for the telegraphic news. The Weekly is the great farmers', planters', and shop-keepers' paper of the country.

Advertisements of schools will be inserted in THE TRIBUNE, carefully classified and alphabetically arranged, at the following rates :

DAILY TRIBUNE.

*"THE READER" DISCUSSES* on page 76 *a new series of Reading-Books for Schools, arranged in an advancing sequence of complexity, just issued by Macmillan & Co.*

# *The Reader.*

LEARNING TO READ BY A PATHWAY OF ENGLISH MASTERPIECES—A NEW SERIES OF SCHOOL READING-BOOKS.

THE excellence of the rules adopted by the English Council on Education for the teaching of Reading makes it desirable that they should be known in all English-speaking countries and the series of Reading-Books approved by their committees be brought to the notice of this as well as other nations. A set of seven neat progressive Readers, varying in compass from forty to four hundred pages, has been issued during the present year as embodying the views held in those schools that are regulated by state inspection in England, and it is probable that no series could be found so certain to train a youthful mind in literary taste by holding it to a contemplation of classical masterpieces, and in their arrangement so true to a wise theory.

Beginning with the simplest lessons of Pronunciation along an easy scale of vowels and consonants, the Readers advance in complexity until, along with their collateral lessons of Grammar and Elocution, they embrace also a very fair education in another allied subject, the Criticism of English Literature. The compiler refers to the requirements of the English School Code of 1865 for advanced scholars (*i.e.* "reading with fluency and expression, and recitation of not less than fifty lines of prose, or one hundred of poetry, taken from one or more standard authors") as "really corresponding in some degree to those of the special subject of English Literature"; and with this warrant proceeds to turn his young readers loose in the richest pastures of British poetry and prose. The last Reading-Book is thus an admirable Anthology, with nothing of the school-reader about it, and apt to captivate the growing taste as well as form it.

A little Primer begins the series, commencing with simple combinations of vowel and consonant, and advancing to short, crisp sentences, made attractive to children with a free use of their own juvenile phrases, so that an infant whose mind was filled with this book might come to chat and tell its adventures—nay, even to quarrel and chide—in good grammar.

The Code of Book I. is "to read a short paragraph from a book, not confined to words of one syllable." Here we have short and common words (with such knotty customers as "yacht" and "slough" rather treacherously smuggled in with the more phonetic ones) associated with the child-classics of "Twinkle, twinkle," "Mary's Lamb," and the like.

That of Book II. is "to read *with intelligence* a short paragraph." Under this exercise comes the earliest freshness and spring aroma of the Edgeworth-Barbauld-Mary Lamb garden, with a more aromatic and unfamiliar bouquet derived from William Blake, Wordsworth, and Sara Coleridge.

That of Book III. is "to read with intelligence a short paragraph from a more advanced reading-book." That of Book IV. is 'to read with intelligence a few lines of poetry selected by the Inspector," with an examination upon the meaning and allusions of the verses and the parsing of a simple sentence. Book V. provides for a longer exercise of a similar sort, with parsing and analysis. These three books contain pure and faultless specimens from the best writers, including, of course, Longfellow, Bryant, and Irving, and—doubtless to show that an apocrypha is as valuable for literary and rhetorical purposes as true history—the legend of Washington and his hatchet. There are also comprised such *ben trovato* extracts as Dr. Johnson's penance at Lichfield from Warner's 'Tour in the Northern Counties,' Mr. Hughes's portrait of the pony Moggy from the 'Memoir of a Brother,' the *Times* correspondent's account of the Charge at Balaklava, and sketches of Arabian travel by Mr. W. G. Palgrave. In these cases the editor will be apt to *make* classical literature of his extracts, instead of finding them such.

The Sixth and final Reading-Book has a capital Introduction to English Literature, historical and analytic, and a selection of Folk-Songs and prose that yields to no "holiday book" of compiled *chefs-d'œuvre*, in interest, veracity, and taste.

*Life of St. Teresa.* By Miss Maria Trench. With Portrait engraved by Jeens. Cr. 8vo, $3.

*High Hopes and Pleadings for a* Reasonable Faith, Nobler Thoughts, Larger Charity. Sermons preached in the Parish Church of Tooting Graveney, Surrey. By John Congreve, M.A., Rector. Crown 8vo, $2 50.

*Building in Silence*, and other Sermons. By the Rev. J. A. Jacob, M.A., St. Thomas's, Paddington. Extra fcp. 8vo. [*Immediately.*

*Sermons preached in the King's* Weigh House Chapel, 1829–69. By T. Binney, LL.D. Edited with Biographical and Critical Sketch, by Henry Allon, D.D. With Steel Portrait. 8vo, $4. (First Series—extra fcp. 8vo, $1 75.)

### BOOKS FOR ATHLETES.

*The Art of Swimming in the Eton* Style. By "Sergeant" Leahy, Champion of the Red Sea, 1849–50; now Teacher of Swimming at Eton College. Edited by Two Etonians, with a Preface by Mrs. Oliphant, and Illustrations by F. Tarver. Crown 8vo, $1.

"When we turn to the matter of the little work we find it full of good sense. Though the book is a slight one, it leaves little more to be said upon swimming. . . . The thousands of people now at watering-places may find his book entertaining in itself and stimulating to improvement in a very necessary art."—*N. Y. Evening Post.*

*Training in Theory and Practice.* By Archibald Maclaren, The Gymnasium, Oxford. With Frontispiece and other Illustrations. Second and enlarged edition. Crown 8vo, $2 25.

*A System of Physical Education,* Theoretical and Practical. By A. Maclaren, Oxford. With 346 Illustrations. Extra fcap. 8vo, $2 25.

*University Oars.* Being a Critical Enquiry into the After-Health of the men who Rowed in the Oxford and Cambridge Boat Race from the year 1829–1869. By John Ed. Morgan, M.D., etc. Crown 8vo, $3.

*Lessons in Prescriptions and the* Art of Prescribing. By W. H. Griffiths, Ph.D., L.R.C.P.E. 18mo, cloth, $1 25.

*On Alcohol:* Six Cantor Lectures delivered before the Society of Arts. By B. W. Richardson, M.D., F.R.S. Crown 8vo, 50 cents.

*First French Exercise Book.* By Hermann Breymann, Ph.D., Lecturer on French Language and Literature at Owens College, Manchester. Extra fcap. 8vo, $1 75. [*This day.*

By the same Author.

*A French Grammar based on* Philological Principles. Extra fcap. 8vo, $1 75.

"This small French Grammar of Mr. Hermann Breymann is a work in the right direction, and one that deserves the attention of all those who are interested in the study of the modern languages."—*The Nation.*

By Gustave Masson.

*A Compendious Dictionary of the* French Language (French-English and English-French). Followed by a list of the principal diverging derivations, and preceded by chronological and historical tables. By Gustave Masson, Assistant Master at Harrow School. Square, half-morocco, $2 50.

*The Unseen Universe; or, Physical* Speculations on a Future State. 8vo, cloth, $1.

"This book is one which well deserves the attention of thoughtful and religious readers. . . . It is a perfectly sober enquiry, on scientific grounds, into the possibilities of a future existence. . . . Nature has been questioned at all points, and has returned many answers, some of which are clear, distinct, and undeniable, while others are still dim, misty, and uncertain. All these must be taken into account in framing any theory of the universe. The peculiarity of the present work is, that the authors are quite capable of doing this, and that they have, in point of fact, done it. They have no prejudices against any of the conclusions of modern science; they do, as a matter of fact, accept almost all these conclusions; and they do not feel themselves thereby precluded from accepting also, not merely a vague sentiment of Christianity, but the dogmatic theology of the Christian Church. That, in the present state of public opinion, is in itself a most important fact."—*The Guardian, June 23.*

"Of the authors it may be said that they are, at all events, no sciolists in physics, and the way in which Biblical Texts and the most ruthless of modern hypotheses combine to shape and support their conclusions is, in this year of grace 1875, a phenomenon which really gives one an impression of freshness and originality. . . . The book will be found suggestive both to men of science and divines; and it deserves to be widely read."—*The Nation.*

"A remarkable work, which has attracted more attention among scientific thinkers than any of the kind which has seen the light for a long period."—*N. Y. Times.*

### SUMMER READING.

*Lady Duff Gordon's Last Letters* from Egypt. To which are added Letters from the Cape. With a Memoir by her Daughter, Mrs. Ross, and a Portrait engraved on Stee by C. H. Jeens. Crown 8vo, $2.

*Lady Strangford's 'Egyptian Se-* pulchres and Syrian Shrines.' Including a Visit to Palmyra. By Emily A. Beaufort (Viscountess Strangford). Crown 8vo, $2 50.

*Baron de Hubner's 'A Ramble* Round the World.' Second edition. 12mo, $2 50.

*The Misses Hill's 'What we Saw* in Australia.' Crown 8vo, $3.

"Their book will be found a storehouse of useful information about Australia."—*Saturday Review.*

*Macready's Reminiscences, and Se-* lections from his Diaries. Edited by Sir Frederick Pollock, Bart., one of his executors. With four Steel Portraits. 12mo, $1 50.

Messrs. Macmillan & Co.'s Select List of School-Books mailed free to any address on application.

*NEW YORK, THURSDAY, AUGUST 5, 1875.*

## The Week.

ANDREW JOHNSON died last Saturday, after, as he so often reminded us, "having filled every office in the gift of the people, from that of village alderman up to the chief magistracy of this great nation." His beginnings were of the humblest kind; and we believe it was true he received instruction in the arts of reading and writing from his wife. He owed his political success to the fact that he made himself from the first the champion of the poor whites in Tennessee against the slaveholding aristocracy, and the position he held towards the latter doubtless had much to do with arraying him on the side of the Union at the outbreak of the war. During the subsequent struggle he displayed the most undaunted courage and fortitude, and was in 1864 perhaps the most conspicuous Unionist at the South. It was this simply which led to his nomination for the Vice-Presidency at the Baltimore Convention in that year. Hardly any Northern politician had any intimate knowledge of his character or capacity, and, when an accident raised him to the Presidency, he appeared before the Northern public as an odd and unknown man, whose manners astounded them. "His policy" of Reconstruction was undoubtedly inherited in its main features from Mr. Lincoln, and was substantially that which Mr. Lincoln would, had he lived, have been allowed to carry out. But the action of several Southern legislatures towards the colored people, the fierceness of temper bred at the North, and the increased ascendancy given to the radical wing of the Republican party by Mr. Lincoln's assassination, made that policy no longer possible—a fact which Johnson was too obtuse and too ignorant to see. His warfare in defence of it rapidly degenerated into a broad farce, in which the Republican majority in both Houses, headed by a few fanatics and stimulated by a portion of the Republican press, played a ludicrous and ignoble part, but which came near having a serious termination, by putting the Government into the hands of a section of the party directed by B. F. Butler, and ready for any excesses in defence of whatever they were pleased to consider "human rights." Apart from this incident in his official career, and a somewhat absurd suggestion of repudiation of the public debt, Johnson's course was in the main unexceptionable. His cabinet was composed of able men, designated for their places by public opinion; his personal integrity was beyond question; and his respect for the laws and the Constitution made his Administration a remarkable contrast to that which succeeded it. His reappearance in the Senate last winter was the result of another popular victory in Tennessee, but only gave the old man one more opportunity of making himself ridiculous, of which he fully availed himself.

---

The Indian Commission has been holding a meeting at Long Branch, and has issued an address to the "Christian public," which says in substance that they (the Commissioners) are the representatives of nine missionary organizations; that the present policy of the Government towards the Indians is humane and Christian; that it seeks the elevation of the Indians by moral and religious means, or, in other words, by the same agencies as those employed by the missionary societies among the heathen; that this policy has been very successful, and is bringing about the civilization of all the Indians, except three or four bands of Sioux "in the high altitudes of the Rocky Mountains," and though these bands, who are very fierce, "refuse teachers and preachers, and desire neither books nor civilizing arts," they are, in some mysterious manner, markedly improving also; that great care is taken by the religious bodies in the selection of the Indian agents, but the salaries allowed by law are so small that it is not surprising if men of the necessary standing and ability cannot always be found for the place, and if the agents, considering the low character of the traders and contractors with whom they are brought into contact, should occasionally be found corrupt; that neither the Government nor the Board would, however, be justified in accepting all sorts of "loud-mouthed accusations" against them; that most of the charges of fraud come from disappointed contractors and traders, but, at the same time, there ought to be investigation when they are brought by "respectable and responsible parties"; that they are not aware of the existence of any more or other "rings" in the Indian service than are found in any branch of the public service in which large contracts have to be awarded; that the success of this humane policy depends on the sagacity and wisdom of the missionary boards in the selection of agents, but that there is "required on the part of all good men a comprehension of the difficulties of the work and a fair amount of patience with those who administer it"; that much of the present clamor is raised and promoted by "bad men" who seek the destruction of the "humane policy" at any cost; and finally, that the Indian service is and has been for several years under the control of the religious bodies of the country, and that upon them will rest the success or failure of this policy.

---

Apropos of this, Mr. Wayne MacVeagh, who was offered a place on the commission appointed to investigate matters at the Red Cloud Indian Agency, but has declined it, calls attention, in a letter to the *Tribune*, to several points in the history of the President's relation to the Indian service which it is at this juncture but simple justice to remember. One is, that when he was general of the army he strongly recommended the transfer of the Indian Bureau to the War Department; or, in other words, the transfer of the service from thieving traders to honest gentlemen. Another, that when he became President he tried to effect the same object by appointing army officers Indian agents, but, as Congress needed the places for the "good of the party," it thwarted this plan by promptly enacting that every officer accepting such an appointment should be held to have resigned his commission. As a last resort, he then called on the religious denominations to supply him with Indian agents, and it is this system which is on trial to-day.

---

Now, all this is creditable, and he ought to get credit for it, and we wish most sincerely we could stop here. But Mr. MacVeagh's statement makes it necessary to recall the fact that six of the ten Indian Commissioners originally appointed by the President in 1867 on this last basis, and mostly men of high standing in the religious world—such as Mr. William E. Dodge—resigned in 1874, and published a letter to the President, in which they expressed their regret that the Secretary of the Interior (Delano) had not urged on Congress the legislation they had previously asked for, making the Indian Bureau independent of the Department of the Interior (Delano). They complained, moreover, that the Indian appropriation passed that year was saddled with the condition that all the accounts should be audited in Washington, and all other duties imposed on them be discharged in the same place. They doubtless saw in this provision what the general public saw in it—an artfully-devised scheme for getting rid of them; perhaps suggested by the person most interested in getting rid of them (Delano). They added, too, that the overruling of their decisions by the Department of the Interior (Delano), of which they had had ample experience, would render their auditing idle and vexatious, and that a board like theirs under the control of the Department of the Interior (Delano) would be a useless appendage to the service. Mr. Dodge subsequently explained to a reporter of the *Tribune*—and the statement has never been contradicted—that they found that when they awarded a contract to somebody outside the Indian Ring, it would be awarded soon after to some one whom they had tried to avoid.

The law, too, he said, required that all bills should be audited by them, but gave the ultimate power of payment to the Secretary of the Interior (Delano), and it was frequently found that bills which they had disallowed were paid by him (Delano) all the same. Now, as they were allowed to resign, while the worthy Delano retained and still retains his place, we wish Mr. MacVeagh would inform us what conclusion a fairly charitable and honest man is to draw regarding the President's good faith in the execution of the "humane policy."

---

We were mistaken last week in speaking of General Patrick H. Jones as Mr. Sharpe's successor in the United States Marshalship in this district; his successor was Mr. Fiske, the present holder of the office. But this does not excuse Major Bundy for saying in his *Evening Mail*, by way of correction, that Sharpe was nominated for the Surveyorship before 1873; that Mr. G. W. Curtis did not resign his Civil-Service Commissionership on account of this appointment, and did procure the appointment of his (Sharpe's) successor. These statements are all untrue—Sharpe, for instance, having been nominated March 14, 1873. We beg to call the attention of the *World* to Major Bundy's conduct. It has threatened him with serious penalties in case of a repetition of such offences as the foregoing, and we now ask for judgment and execution.

---

The waning speculation in breadstuffs was revived in the latter part of the week, not by the renewed demand from Europe for our grain, for the harvests there, although not good, are not so bad as it seemed they would be two weeks ago, but by a continuance of heavy rains in parts of the West where excellent harvests were looked for. Unfavorable weather has also injured the cotton prospects in some of the Southern States, but the damage to cotton has been much less than to grain in the Western States. Very much now depends on the weather in the next few weeks, both here and in Europe. To attempt calculations with the premises so uncertain is worse than useless. With the weather given, however, the problem is easily solved. Mr. Bristow continues his gold sales, having advertised $5,000,000 for August. The syndicate having in charge the new funding 5 per cent. loan continue to sell bonds in Europe more rapidly than they can buy the 5-20 six per cents called for redemption. To this is due the fact that they are supplying most of the bankers' exchange coming on the market. The public-debt statement shows a reduction during the first month of the fiscal year of $1,294,837. The legal-tender note circulation is now $374,824,935, or $7,175,015 less than it was when Mr. Richardson left the Treasury. At the Stock Exchange, dulness has been the characteristic of the week, but prices have nevertheless improved. Money is still very abundant, and the failure of Duncan, Sherman & Co. had little influence on the rates for mercantile paper. Most of the domestic paper of that house held in this country was owned in Rhode Island, and this amount was not large enough to be alarming.

---

The failure of Duncan, Sherman & Co. was the subject most talked of for a few days, but after the surprise had fairly disappeared, and the public became aware that it would not bring down other firms, all interest in the matter, except on the part of those who are creditors of the house, passed away. In London it caused scarcely a ripple; the Bank of England directors, at their weekly meeting, within forty-eight hours of its occurrence, reduced the discount rate of the Bank to 2½ per cent.; and the London market, so far from having been staggered by the news, became positively buoyant. It may now safely be said that it had no public significance. Many, however, will lose by it, and none will be caused more vexation and annoyance than travellers holding the letters of credit of the house. It is likely that some arrangement will be made for protecting them, even if it should be necessary for some of the relatives of the leading partners to make the aid a personal matter.

The principal losses, aside from what may be borne by Mr. Alexander Duncan, the father of the head of the house, fall on the depositors. One is spoken of as having had $900,000 with the firm, but as entirely able to lose it, having besides and elsewhere over $2,000,000 in one kind or another of property; another is mentioned as having $600,000 in the house; and it is known that $420,000 due to a Chicago corporation was involved, in that it was in process of transfer from London to Chicago, having been turned into the Union Bank of London, one of the correspondents of the failed house, and not yet taken out here. One former depositor was said to have withdrawn several hundred thousand dollars from the house a few days before suspension, whether because his fears were excited or by chance is not mentioned. The statement of the liabilities and assets of the house has not yet appeared, and exactly what it will show is a matter of conjecture; that the statement will not be satisfactory is inferred from an understanding, common in Wall Street, that there has been a sale of a creditor's claim for thirty cents on the dollar. It is more than conjecture that the statement will show that the house has been sustained in its London credits for several years by Mr. Alexander Duncan, who, it is now known, has been, at least in part, indemnified by the transfer of real estate here and elsewhere, which was supposed until the day of the failure to have been the personal property of Mr. William Butler Duncan; and, more, that the failure was precipitated by his declared unwillingness to pledge himself for the further acceptance in London of the bills of the New York firm.

---

Senator Thurman, General Hayes, and Mr. Sherman have made their speeches in Ohio, that of the first, of course, attracting most attention. It consisted of an elaborate attempt to justify the support of the Ohio platform by hard-money men. He even went so far as to attempt to persuade his hearers, or himself, we hardly know which, that the Democratic platform is not an inflation platform at all, but the main drift of his argument was directed to showing that the general interests at stake in the campaign were so much more important than the currency question, and the effect of the triumph of even an inflation platform in a local Ohio election so small, that it was the duty of good Democrats to sink their feelings about the currency question. The speech does not seem to have been a marked success, for there can be no doubt that, however much the hard-money Democrats may be willing to stifle their feelings, the inflationists have no idea of suppressing theirs, or encouraging the spirit of compromise. There is only one difficulty with Mr. Thurman's argument, and that is, it does not seem to convince anybody. The Republicans are of course unaffected by it. To the "independent voter," who just now in Ohio is apt to test politicians by their financial opinions, it only means that Mr. Thurman has made up his mind to swallow a very disagreeable dose, and the Democrats are disgusted with its lukewarmness. They don't want to have excuses made for what they are doing. They want the unterrified Democrat to rally round the old standard, and strike one final blow at the shackles of money-kings, and free his country from the Black-Republican blight.

---

Several judicial decisions of a good deal of interest have been made this week, two connected with the Tweed proceedings and two with the canals. The Canal Commission, it seems, has not power to punish for contempt, and, according to Judge Learned, though witnesses may be compelled to appear before it, they cannot be compelled to give their testimony when they have appeared. Judge Westbrook has also decided that the State cannot recover $55,000 paid to Jarvis Lord on a canal contract which he obtained by a fraudulent combination with other contractors, the competing bids having been suppressed or destroyed. This is a *pro-formâ* decision, following a precedent, in order to give an opportunity for an appeal, and it certainly seems as if the question needed reargument. The same judge has also been compelled, by the rule established in the Tweed case, to make a decision which ought to be gratifying to mur-

MALDEN PUBLIC LIBRARY.

derers, burglars, thieves, pickpockets, and all persons under sentence of court. A man, named Aaron Jacobs, had been committed for contempt in the Superior Court, and sentenced to thirty days' imprisonment and a fine of $2,470 54, which was made up of three separate sums of $2,068 29 due to a suitor in the court, $252 25 costs, and a counsel fee of $150. Jacobs, hearing of the Tweed case, at once applied to Judge Westbrook for a habeas corpus, on the ground that the counsel fee could not be included in the sentence, and the Court had therefore exceeded its jurisdiction. To this the counsel on the other side replied, that inasmuch as the fine had been imposed by a Court of competent jurisdiction the sentence could not be enquired into by habeas corpus before another judge of another Court. To this Judge Westbrook said that he had "always so understood until the recent decision in the Tweed case," but he should be compelled to follow that precedent. It seems, therefore, that anybody who can satisfy a judge that another judge has exceeded his jurisdiction, can habeas-corpus his way out of jail in a very summary manner. It is singular that Judge Westbrook should never have heard of this before if it was sound law. The new rule would seem to afford all the conveniences of the old New York law of injunctions applied to criminal cases. The public mind has been somewhat startled by all these decisions, but has been relieved by Judge Barrett, who has decided that Tweed's $3,000,000 bail in a $6,000,000 suit is not to be held excessive. Tweed's lawyers tried to persuade the Court that anything was excessive which the "old man" could not procure, but the Court thought otherwise.

---

The decision as to the powers of the Canal Commission has an important bearing on the Indian investigation now going on. The Indian Commission has no more power to punish for contempt than the Canal Commission, so we may expect to find the movements of the latter rather hampered by the courts as soon as it tries to force "the bad men" who hold the contracts to make any important disclosure. Another decision, which must not be overlooked by reformers, is that of Judge Donohue, who decided the other day in the Tweed $6,000,000 suit that the plaintiffs must furnish the defendant a "bill of particulars," giving the date, amount, and tenor of all the fraudulent bills. The beauty of this decision is that, inasmuch as Tweed has by the destruction of all these documents put it out of the plaintiff's power to produce them, the suit cannot go on at all. Under ordinary circumstances, we do not like to criticise decisions of inferior courts which have been carried up on appeal, but this decision we have no hesitation in pronouncing nonsensical. If a man can, by destroying papers, put it out of the power of people whom he has swindled to sue him, we may rely on a great diminution in the number of cases tried in this city.

---

Tilton has served notice of a new trial in September, and his lawyer says he has fresh evidence. We hope he is, however, not going to impanel another jury. Why not produce the evidence before some respectable referee, publish it in all the papers, and then kiss all around, and live happily ever after? The jury are sure not to agree, and the evidence is of course intended mainly for the public. We notice that Brother Shearman is over in England enlightening the pious people in London about this "infernal conspiracy." There can be little doubt, however, that the two last years of James Fisk's career contained matter of far deeper importance to society, both in England and America, than the Beecher-Tilton business, and just as little that on that subject Brother Shearman is one of the highest living authorities. We would suggest, therefore, a lecture on it at the City Temple before he comes home. The American public can put up with a great deal in the shape of audacity, and especially pious audacity, but surely there are limits to its patience.

---

The news from England is of little moment. Mr. Plimsoll's quarrel with the House of Commons has turned into a triumph. There has been one of the monster meetings in London so common of late, to protest against the appropriation of money to pay the expense of the Prince of Wales's trip to India, and another to demand the release of the Fenian convicts. The Prince of Wales's trip is one of the natural incidents of the existence of the Indian Empire, and to fight against the visit, while not objecting to the Empire, is one of those halfway performances for which British republicans have a special fancy. The release of the Fenians would be tantamount to a declaration that any man might with impunity give you a black eye in the street if he would solemnly pledge himself that his object was the general elevation of the community. The Fenian movement was based upon the theory that war is declarable at any moment in any place by any person. Great preparations are being made for the O'Connell Centennial, but the venerated Catholic clergy in Dublin are said to have got hold of the movement, and, with their accustomed tact, are converting it into a huge Ultramontane demonstration, and so driving off the Protestants.

---

A curious point of ecclesiastical law has come before the Arches Court in England. A Mr. Jenkins was dissatisfied with a sermon of his pastor, Mr. Cooke, on the eternity of future punishment, and wrote him a letter remonstrating with him upon his views. Whereupon, Mr. Cooke, by way of retaliation, looked into a book compiled by Mr. Jenkins, entitled 'Selections from the Old and New Testaments,' and discovered that he had cut out from these selections "all passages concerning Satan or evil spirits," and then informed him that he considered this "terrible evidence" of the extent to which he (Jenkins) "would go in mutilating the Word of God," and that until he made amends for it in a proper manner he should not give him the communion. Jenkins appealed to the bishop, who blew hot and cold alternately, and finally refused to decide the matter extra-judicially; and the minister reported that he had repelled Jenkins from the altar, as a "common and notorious defamer of the Book of Common Prayer," but offered, in negotiations with Mrs. Jenkins, to admit her husband to the sacrament if he would admit "his belief in the devil"—a compromise which Jenkins refused with scorn. Accordingly, the parties went into court, and the case was elaborately argued before the Dean of the Arches, Sir R. Phillimore, who holds that Jenkins is a "criminous layman," "a defamer of the Book of Common Prayer," "a slanderer of God's Word," and an "evil liver," and therefore unfit to receive the sacrament, and that he will have to believe in the personality of the devil and in the eternity of damnation in order to recover his standing. As this leaves Jenkins in a very uncomfortable position, he has naturally appealed to the Judicial Committee of the Privy Council, holding that the decision in the 'Essays and Reviews' case covers his, and releases him from the necessity of believing either in the devil or the eternity of future punishment. It will be very curious to see what he will do in case he is beaten in the court of last resort, whether he will stay "criminous" or swallow the obnoxious doctrines, and, if the latter, what will be the effect on the sale of his 'Selections from the Old and New Testaments.'

---

The news from Spain reports continued Alfonsist successes, and a consequent rise of the Spanish funds on the prospect of a dissolution of the Carlist forces, but this news about the funds would be more trustworthy if the figures were given. The Carlists have undoubtedly suffered reverses, but the importance of them has yet to be seen. The Cable also announces that the new constitution is nearly complete, and that it provides liberty of worship within doors for Protestant sects, while making the Catholic Church the church of the state, and maintainable out of the public funds. The support of the other sections of Moderates and Monarchists is said to have been secured for the Constitution, and the Republicans are too much disheartened to offer any opposition; so the probability is that it will go into force, and that the Cortes will be summoned under it, and the machinery of regular government once more set in motion. The Pope, who was at first disposed to throw his influence into the scale on the side of Don Carlos, has now so far recognized Don Alfonso as to send a Nuncio to Madrid. The French are now busily engaged in guarding the frontier to prevent the retreat of Carlist troops across the line, which looks as if they believed the Alfonsist military reports.

## CHRISTIANS IN POLITICS.

THE address of the Indian Commissioners to the "Christian Public" touching the charges made against Secretary Delano and Commissioner Smith, is very suggestive in more ways than one. It draws attention, in the first place, to the fact—and it is a very remarkable fact—that the President of the United States had been obliged, in sheer despair of securing honesty and efficiency in any other way, to confide the selection of the officers in an important branch of the public service to the missionary societies of the various religious denominations. He tried to have the duty of feeding and managing the Indians turned over to officers of the regular army—a body of men already in the service of the Government, and which has given the highest proof both of honesty and capacity in every position in which it has been placed, and whose ordinary work brings it into constant contact with the Indians—but he found himself foiled in this by the action of Congress, which passed a bill turning every officer out of the military service who accepted an Indian agency. The places were evidently needed for a very different class of men. This resource being cut off, he determined to throw the responsibility on the various religious organizations, and asked them to furnish him with commissioners and agents, and they are doing so. The reason why it is so difficult to get the Indian subsidies properly distributed is very simple. All the other disbursements of the Government are made to civilized men and women, who understand accounts and weights and measures, and have sufficient intelligence and knowledge of the law and of the modes of legal redress to be able to look after their own interests. The Indians, on the contrary, not only have no knowledge of accounts or of the law, but do not understand the mechanism of civil society. They consequently either do not know when they are cheated, or, if they know, are unable to help themselves. The distribution of stores to them, therefore, offers more chances for fraud than any other branch of the public service, and it is sought eagerly by the most dishonest men. If there be any branch of the public service the moral tone of which is high, the Indians should for these reasons be handed over to it. The army is such a branch, but, for the reasons above stated, the army cannot be made available for the work. The President has, therefore, tried to create a corps for this special duty, by practically adopting the rule that nobody but men who have made a public profession of religion shall be put in charge of the Indians—for this is what handing the work over to the missionary societies means in practice.

It is easy to show, however, that the arguments in favor of the adoption of this course with regard to the Indian service differ in degree only, and not in kind, from the arguments in favor of putting religious men in all other departments of the public service, or, in other words, of handing the state over to the church. There is doubtless more need of them in the Indian service than in others, but there is need of them in all. They are needed in the Pension Bureau, in the collection of the internal revenue, in the appraiser's office at the Custom-house, and in all other positions where a great deal has to be left, without check or control, to the officer's honesty and fidelity. The missionary societies have no special facilities for dealing with the Indian service. They doubtless have in their employ or within their knowledge a considerable body of persons possessing special fitness for the work of Christianizing or civilizing savages, but they have no peculiar facilities for supplying men with special fitness for the work of disbursing Government money in large amounts, or for making large contracts for supplies of various kinds and seeing that they are properly executed. Indeed, any large business house which had a great deal of this kind of work to do, would never think of applying to missionary societies for men to do it. If, therefore, the religious organizations are fit to take charge of the Indians, they are fit to take charge of the Treasury and the Attorney-General's office. If we need religious men for Indian agents, we need them for collectors and appraisers and marshals. There is no escaping from this conclusion. The temptations to knavery may be less strong in these latter offices than in the Indian agencies, but they exist in all. If nothing but the church can reform the civil service, to the church let us go. Every poor white man who pays a tax, or draws a pension, or sues out a writ, is as much entitled to its protection as Red Cloud or Lone Wolf.

What are the objections to this course? Why should we not make a profession of religion, or a certificate of religious character from some religious association or denomination, a condition of entrance into any branch of the civil service? Why should we not hand all the whole work of Governmental administration over to the missionary societies, for instance? We think the answer to this is furnished by the recent history of the Indian Bureau, as well as that of some other places of trust and profit in the public service and elsewhere; but, before stating it, we will say frankly that we think the selection of all employés from among the professors of religion would, for a while, be an enormous gain on the present system. It would supply a test of character of very great value the first time it was applied, because there is no question that, taken as a whole, the members of churches are more likely to be honest, upright, and trustworthy than the rest of the community. One sees why this must be so without taking any very high or spiritual view of the matter. Persons who make an open profession of religion may be divided roughly into three classes: (1) really spiritually-minded persons of pure lives, who have a longing for communion with God, which finds expression and satisfaction in the public worship and various other ministries of a religious organization; (2) persons with more or less desire for right living, but with so little strength of will and so much carnal weakness that they are constantly giving way to temptation and losing their self-respect, and join the church as a kind of external help in satisfying the demands of their own consciences; and (3) the worldly schemers who have no religious sentiment whatever, and no belief in God or devil, but have acquired skill in the use of religious terminology, and see, or think they see, that religious profession is a powerful help in trade and commerce. As regards the first two classes, church-membership is unquestionably a means and a sign of a higher than the average morality. As regards the last, it is unquestionably also a powerful restraint. There is many a man of this class whom the church probably keeps out of jail by the help and comfort it brings him in business and in society, and by the way in which it concentrates public opinion on him. If anybody were to determine, therefore, in a general way, that he would employ none but church members, he would find that on the whole he was making his selection from an excellent class, and stood a better chance of being served well than if he trusted to the ordinary modes.

But if the Government were to attempt to carry the plan General Grant has resorted to into the whole service, certain evils would show themselves speedily in a very aggravated form which are already showing themselves in a slight one, and from which religion would be and is the first to suffer. The selection of officers from among church-members would put a premium on the profession of religion which would enormously increase the class who resort to it as a help to selfish ends and in a spirit of complete hypocrisy. In the next place, it would enlist the spirit of denominational pride on the side of all persons actually employed, and make it a permanent and powerful shield for wrong-doing. What a strong and unruly spirit this is, and what a grief and shame it has been to really religious men in all ages, those know who have even a very slight acquaintance with ecclesiastical history. The *esprit de corps*, even in purely secular bodies, is a strange breeder of unscrupulousness and blindness; when touched by devotional feeling, it will carry even conscientious men to extraordinary lengths of deceitfulness and pride. There has, in fact, been nothing, in the history of any secular organization for ordinarily moral objects, more remarkable in this way than the investigation of the frauds in the Methodist

Book Concern two or three years ago. Protestantism has not nearly so much of this debasing dread of scandal as Catholicism, but it has enough to be ashamed of. Then, too, all religious teachers, and most religious professors, dwell so strenuously on the necessity of a change of heart in the religious sense, and promise so much effect from it on conduct, that they are in some degree, though often unconsciously, pledged to the support of a religious person under all circumstances. A charge of any kind against him is met with a strong presumption of innocence, based on the mere fact of his religious standing, so that he is not expected even to answer at all until things reach a point at which a man of the world would be already ruined.

The inconveniences of such a state of things in the public service it is needless to point out. It is in the first place in the highest degree objectionable, and full of danger to character, to treat anything as a qualification for a place of trust or profit which is not capable of submission to any external test, and of which it is not possible to learn anything except from the candidate's own story—as, for instance, the state of his heart. For the purposes of religious co-operation and fellowship his own story is enough, because he has no motive for deception; but to make professions of faith a passport to an Indian agency or a fat contract or other profitable place, is to furnish a temptation of the strongest kind to hypocrisy in its lowest form. In the second place, to shield an official from investigation, for instance, or justify his silence under accusation, on the ground that as a religious man he is not under the same obligation to answer as a mere worldling, is to create a privileged class of the most odious kind. No government has any right to create any such distinction as this involves, and no government is fit to create it. Besides which, such a distinction puts a strain of the most serious kind on religion itself, for when a professor, after kicking against enquiry and standing on his religious character, is finally forced to submit to it, and is, as sometimes happens, found to be wanting, his fall, by the attention and disgust it excites, brings religion itself into a discredit which a hundred blameless Christian lives are not sufficient to overcome. In fact, it is only by living under the common law, and claiming no privileges or exemptions or presumptions which other men may not claim, that a Christian can, as such, do any good in politics. So far from trying to withdraw himself from investigation on the ground that he is pious, he ought to submit himself to it all the more readily for that reason. He ought not to allow his church standing, whatever it may be, to be put forward as a substitute, either in whole or in part, for any wise or salutary mundane precaution against fraud and incompetency in the public service; and the first and greatest of these precautions lies in the rule, that when a man is called on to account he shall account promptly, and that when he is accused he shall answer frankly. To allow the church to be used as a sanctuary for sluggards or thieves would be a very extraordinary thing in this day and generation, after all the experience the world has had of the results of ecclesiastical administration of temporal concerns; and we would warn religious people against the consequences to religion of their taking the ground, with regard to any man in public life, that his spiritual condition, as described by himself, raises, or ought to raise him, above suspicion.

## THE WITHDRAWAL OF CAPITAL FROM TRADE.

THE report of commercial failures during the first half of the year 1875 is not altogether encouraging. In six months, 3,377 failures are reported—a number exceeded in only seven full years out of the last twenty. Unless the number during the last half of the year should be much smaller, the aggregate for 1875 will exceed that of any year in our history except 1861. Comparison of this report with those of previous years reveals some very instructive facts.

To those who anticipated speedy relief from the legislation of last year, or of Congress at its last session, this report is especially discouraging. They believed that disorder had been caused by a deficiency of circulation, and clamored for "more money." Congress "unlocked forty millions," according to Senator Morton's theory, by abolishing the reserve against circulation. They clamored for "free banking," and complained that States of the West and South were in distress because they had not as much bank circulation *per capita* as the Eastern States. Congress permitted, under the national system, absolutely free banking, and unlimited issue of currency. For more than a year we have enjoyed the manifold blessings of an "unlocked" currency, and for nearly six months the incalculable benefits of free banking. But these six months have brought more failures than any six months of our history, except at the beginning of the civil war. If inflationists could in any way be brought to comprehend the first principles of finance, this experience might convince them that disorders of industry exist which require, not more currency, but more capital, and that the mere possibility of further inflation has caused much capital to shrink from risks and withdraw from active employment.

Indeed, far above the level of the Granger, the Communist, or the blatant demagogue, there are practical men of business, and writers on financial topics, who do not fully realize the enormous withdrawal of capital and credit which has occurred. It is generally assumed that the average liabilities of the thousands of firms that fail give an approximate indication of the average liabilities of solvent firms. The failures represent all classes, as to magnitude of business, mercantile standing, and supposed resources. If the solvent firms enjoy larger credit, it may also be presumed that they are more cautious and do not stretch it to the utmost. But the average liabilities of firms failing in 1875 have been only $22,191, while the average liabilities of firms failing in 1873 were $44,085. If we may infer that the average liabilities of solvent firms have been reduced in nearly the same proportion, it would seem that nearly one-half of the indebtedness borne by the commercial classes when the disorder culminated in 1873, has now been discharged. In the lists from which records of failures are taken there are about 650,000 solvent firms. If the average indebtedness of solvent firms is not larger than that of those which have failed, the aggregate liabilities of commercial firms in this country were reduced from about $28,000,000,000 in 1873 to about $16,700,000,000 in 1874, and have been further reduced to about $14,430,000,000 in 1875. These figures serve to give an approximate idea of the current liabilities at different periods, the aggregate indebtedness incurred during the year being three or four times as great. But if nearly $14,000,000,000 of current liabilities have been discharged since 1873, credit and capital to that amount have been withdrawn from active employment.

In one point of view, this is a healthy symptom. Indebtedness is being reduced. The proportion of business done on a cash basis has largely increased. The average time of commercial notes has been shortened. But there has also been a great shrinkage in business transacted, a withdrawal of many millions of capital from employment, and an increase in the number of failures, notwithstanding the reduction of indebtedness and the greater caution in transactions. This is the most significant feature of the report. The following statement shows the number of failures in certain years, the amount of liabilities, and the average liabilities to each failure, and in the last column the aggregate exchanges of the New York Clearing-House during the twelve months ending September 30 of the years named:

| Year. | Failures. | Liabilities. | Average. | N. Y. Clearings. |
|---|---|---|---|---|
| 1857 | 4,932 | $291,750,000 | $59,154 | $8,333,226,718 |
| 1858 | 4,225 | 95,749,000 | 22,662 | 4,756,664,386 |
| 1859 | 3,913 | 64,394,000 | 16,456 | 6,448,005,956 |
| 1860 | 3,673 | 79,807,000 | 21,728 | 7,231,143,056 |

| Year. | Failures. | Liabilities. | Average. | N. Y. Clearings. |
|---|---|---|---|---|
| 1861 | 6,993 | 207,210,000 | 29,631 | 5,915,742,758 |
| 1862 | 1,652 | 23,049,300 | 13,452 | 6,871,443,591 |
| 1863 | 485 | 6,864,700 | 14,154 | 14,867,597,848 |
| 1868 | 2,608 | 63,774,000 | 24,452 | 28,484,288,636 |
| 1869 | 2,799 | 75,054,000 | 26,814 | 37,407,018,986 |
| 1870 | 3,551 | 88,242,000 | 24,849 | 27,804,539,405 |
| 1871 | 2,915 | 85,252,000 | 29,245 | 29,300,986,682 |
| 1872 | 4,060 | 121,056,000 | 29,750 | 33,844,369,568 |
| 1873 | 5,183 | 228,499,000 | 44,085 | 33,972,773,942 |
| 1874 | 5,830 | 155,239,000 | 26,627 | 20,850,681,962 |
| 1875 | 3,377 | 74,940,809 | 22,191 | . . . . |

The figures for only six months of 1875 show failures exceeding in number and liabilities the average for eight full years out of fourteen. Yet the average of liabilities to each failure is lower than in any year except four. The credit system is apparently less overstrained than it has been in any year since the war, and scarcely more than in 1860, a year of marked prosperity. This disorder, then, can no longer be attributed, as by many it has been, to mere overtrading and abuse of credit. Its causes lie deeper. There has indeed been abuse of credit, beginning as early as 1871, and culminating in 1873. But even at its maximum the average of indebtedness was much smaller than in 1857, and in 1874 it was reduced to about $26,000, an average scarcely higher than that of prosperous years after the war. Nevertheless, the number of failures does not diminish, as it did after the credit-panic of 1857, but increases with alarming rapidity. After the panic of 1857, though the average of liabilities decreased 61 per cent. in a single year, the aggregate of business transactions represented by the clearings of the New York banks decreased at the same time only 43 per cent. But after the disaster of 1873 the decrease in New York clearings was almost precisely as great as the decrease in average liabilities. The clearings in 1874 were 38.6 per cent. less than in 1873, and the average liabilities 39.6 per cent. less. These facts all point to the same conclusion—that the shrinkage in business has been very great, if not quite as great as the shrinkage in credits and liabilities. Although the indebtedness of the commercial classes has been so far cleared that, under ordinary circumstances, business would be in a very healthy condition, capital still shrinks from risk or long investment.

Much of this unwillingness to invest is due to the crusade which has been made in several Western States against those public enemies, the bondholders, railroad-builders, bankers, manufacturers, and capitalists generally. Counties have set on officials to swindle their creditors. Legislation against railroads has approached the point of confiscation. For the taxation of manufacturing and banking capital, States have passed laws so oppressive that even their own courts have interfered. The Western Communist, whose notion of government seems to be that it is divinely appointed as the means by which the many may rob the few, is responsible already for much commercial and industrial disorder, and has not yet seen the end of it.

But in its dealings with the national finances and credit the same spirit has doubtless done much greater mischief. All investments and business ventures depend in a large degree upon the conduct of the Government. As soon as there was a prospect of a new inflation of the currency, capital began to seek safety, just as the passengers on a Western steamer beg to go ashore when the hands begin to roll tar-barrels into the furnaces. Not even the disaster of 1873 caused as much alarm, or inflicted as great injury upon commerce and industry, as the subsequent uncertainty respecting the financial course of the Government. Every hoarse cry for "more money," every demonstration against the bondholders, drives millions of capital to its hiding-places. Nor can we reasonably expect to see marked improvement until political events have fixed the policy of the Government for some years to come.

## THE WORLD'S FAIR, 1876.

COLUMBIA, puzzled what she should display
Of true home-make on her Centennial Day,
Asked Brother Jonathan: he scratched his head,
Whittled a while reflectively, and said,
"Your own invention and own making, too?
Why, any child could tell ye what to do:
Show 'em your Civil Service, and explain
How all men's loss is everybody's gain;
Show your new patent to increase your rents
By paying quarters for collecting cents;
Show your short cut to cure financial ills
By making paper-collars current bills;
Show your new bleaching-process, cheap and brief,
To wit: a jury chosen by the thief;
Show your State Legislatures; show your Rings;
And challenge Europe to produce such things
As high officials sitting half in sight
To share the plunder and to fix things right;
If that don't fetch her, why, you only need
To show your latest style in martyrs—Tweed:
She'll find it hard to hide her spiteful tears
At such advance in one poor hundred years." J. R. L.

## THE PRESUMPTION OF INNOCENCE.

DR. LEONARD BACON, of New Haven, has written a letter to the New York *Tribune* defending himself against the charge of indiscretion in preaching in Plymouth Church. Upon the propriety or impropriety of this we have nothing to say, nor do we mean to revive the old question of Mr. Beecher's guilt or innocence. But the following passage in the letter seems, as coming from an eminent minister and an eminent instructor in theology, to call for some criticism, as the ideas it reveals as to the nature of proof are calculated to mislead a great many persons on what is in these days a very important matter, viz., the conditions on which a man holds his reputation:

"The man who is charged with an infamous offence, and denies the charge, may rest his defence upon his character. We accept his denial, and wait for proof from the accuser. Mr. Beecher has denied explicitly, and under oath, the charge preferred against him; and, having denied it, he has a right to be regarded as innocent until his guilt is proved. Messrs. Moulton and Tilton, having slowly accumulated, through a period of three or four years, their material of war, and having had the help of Gen. Benjamin F. Butler in devising the plan of the campaign, made their attempt. They had the power of the State of New York to compel the attendance of witnesses, and to make them testify. They had professional advocates of most distinguished ability to examine and cross-examine witnesses, to marshal their evidence, and to argue for them. Their side had the first word of statement to the jury, and the last. It is difficult to say what advantage they could have had which they had not. But after a protracted trial—the most protracted, I believe, save one, in the history of litigation—the result is, on their part, a failure. They undertook to prove Mr. Beecher guilty of a definite offence, and they have not done what they undertook to do. He, therefore, stands just where he stood at his first denial of the charge. The attempt to prove him guilty having failed, the legal and common-sense presumption of his innocence remains unimpaired.

"I have no right to demand—nor has any man a right to demand—that he shall positively prove his innocence. The burden of proof rests on those who accuse him. Our duty is to wait, not for proof of his innocence, but for proof of his guilt."

In the paragraph we have cited, Dr. Bacon uses the word "proof" in two very different senses, without giving the slightest intimation that there is any distinction between them. In other words, he talks of judicial proof as if it were real proof, and *vice versâ*. Judicial proof is evidence, offered under certain artificial rules of restriction, sufficient to satisfy a legal tribunal, *such as it is, or whatever it may be.* Real proof is evidence, offered without any restriction except such as is imposed by general experience, sufficient to satisfy any mind trained in the weighing of evidence and drawing of inferences. But the importance, as regards character, of a man's failing or succeeding in proving a thing even judicially, depends on the nature of the tribunal. Failure to prove a thing before the Supreme Court of the United States would, for instance, be much more serious than failure to prove it before a New York police justice. Failure to prove a thing to the satisfaction of a jury depends, too, for its importance, on the composition of the jury. If the jury be composed of educated, acute men, accustomed to the examination of complicated transactions, and with much experience of business and of life—such, for instance, as what

is called a "struck jury" here, or a "special jury" in England—failure before it means a great deal more than failure before an ignorant jury of small dealers totally unused to legal or other discussion, and without training of any kind. And, after all, the finding of the best legal tribunal is weighty in different degrees. When they find a man guilty, or acquit him, they do not do so with mathematical certainty or nicety. They simply say that, after weighing as well as they could two sets of probabilities, and hearing a large number of witnesses whose testimony had various degrees of probative force, the balance seemed to them to incline for or against the defendant. All that the defendant can then say, out of court, is, that "I have submitted the whole matter to half-a-dozen men, or one man of great learning and experience, or to twelve men of no learning and little experience, and they came to the conclusion that I am legally innocent. This is called in legal nomenclature acquitting me, or declaring that the proofs against me were not sufficient. You may not agree with them, but you must admit this creates a presumption of greater or less strength in my favor, with which I must now be satisfied." In Mr. Beecher's case the result has not been as favorable as this. The proofs have been submitted to a very ill-qualified tribunal, of which only three-fourths have decided in his favor. For legal purposes, this amounts to a failure of the plaintiff to prove his case; but for moral or intellectual purposes, it does not. The failure, in short, is technical, not real, even if we take the word proof in its narrow judicial sense. If Dr. Bacon's use of the word "proof" were correct, Mr. Beecher might at one period have correctly said that he had "proved" his innocence by walking barefoot over nine red-hot ploughshares. The assertion, therefore, that Mr. Beecher "stands where he stood at his first denial of the charge," is ambiguous and misleading. Technically, in the eye of the law, he does so stand. Tilton has acquired no legal rights against him which he did not possess when he published his charge. But really, in the moral and intellectual, and let us hope religious forum, his position has since then been considerably modified by the production of a large number of circumstances which were not known when he made his first denial, and which did in the forum above-named raise a presumption that he had committed a certain offence and had tried to hide it. Before Tilton had submitted any of his proof, to Tilton's simple assertion Mr. Beecher's simple denial was a sufficient answer. The public had no right to ask anything more. But when Tilton produces a number of documents written by Mr. Beecher, and a number of acts acknowledged by Mr. Beecher to have been committed by him, and capable of the interpretation Tilton puts on them, the burden of proof "does not any longer rest on those who accuse him," as Dr. Bacon says. According both to "the legal and common-sense" view, it is transferred to Mr. Beecher. That is, he is bound to show that the more obvious meaning attached to his letters and acts was not the true one; that, on the contrary, they pointed to something different from what they seemed to point to. The opinion most intelligent men hold about Mr. Beecher's guilt or innocence turns on the extent to which they think he has succeeded in making this explanation, and those who say that they are waiting for proof of his innocence are not without justification. His defence, in fact, has consisted in the interpretation of his letters by the aid of his character and surroundings. The burden of proof, therefore, not only rests on him, but he unavoidably assumed it the day he took the stand.

A useful illustration of the situation may be found in the case cited by Bentham, where a robbery is committed in a house, and, one of the servants disappearing on the same night, suspicion fastens on him, and he is arrested. Suppose, however, none of the stolen property is found in his possession, and he is acquitted on the trial, because the proof is not sufficient. Now, here the man was entitled to the benefit of the legal maxim which has been evidently running through Dr. Bacon's mind, "That he must be treated as innocent until he is found guilty." That means simply that he must not before conviction be subjected to any avoidable inconvenience or vexation, and he must not be convicted if the jury have any doubt about his guilt. Juries are always directed by the court to acquit in case they have such doubt, and acquittals on this ground are of everyday occurrence, but they do not amount to a certificate of innocence. The Scotch law has, in fact, provided the formula of "not proven" for the expression of this conclusion by the jury. In the case above-mentioned, for instance, there is no direct evidence of participation in the robbery. But once the man's flight is proved, the burden of proof is transferred to him; and if he wishes to clear himself completely, he is bound to furnish a satisfactory explanation of his flight. This explanation might be unsatisfactory and acquittal still follow on the ground of doubt, but his character would remain damaged. He could not go about seeking a new place as a spotless man on the ground that, although he fled, and could not satisfactorily account for his absence, the jury were not satisfied of his guilt. The very phrase, giving the prisoner "the benefit of a doubt," illustrates the distinction between the "legal" and the "common-sense" view of this matter. The doubt is legally a "benefit" to the prisoner, as it saves him from going to jail, with its attendant inconveniences. It is not a moral or social "benefit." On the contrary, acquittal on such grounds leaves a person's reputation seriously injured. Take as another illustration the case of a man whose roommate is found in the morning shot through the head. The burden of proof is on those who accuse him of murder, as long as he holds his tongue. But suppose he tells two different stories about the matter—one, that he shot his friend by accident in loading his pistol; the other, that his friend shot himself in the night. The defendant then at once becomes burdened with the necessity of explaining these contradictions, and the result of the trial might depend largely or wholly on his success in doing it; the effect on his character certainly would. In short, there is no such general rule as Dr. Bacon lays down. Any acts or utterances of a man's own which point to his commission of an offence, impose on him the necessity of producing positive proof that they meant something else; or, in other words, of producing another set of facts than the one produced by the accuser which will account for these acts or utterances. Mr. Beecher's case is a very interesting one, but it must not be allowed to lead us into mental and moral confusion.

## THE COMTE DE PARIS'S HISTORY OF THE WAR.

PARIS, July 16, 1875.

THE third and fourth volumes of the 'History of the Civil War in America,' by the Comte de Paris, have just appeared. The Prince originally thought that he could finish his work in four volumes; but I doubt whether he will be able to do so in eight. When he comes to the end, he will have a right to say, "Exegi monumentum." I notice a great progress in French style as the work advances; the language has more firmness, the author is becoming more familiar with the wonderful resources of the French language. The great difficulty in a history like this is perspective. The details of sculpture on the face of a great temple need not, and in fact ought not to be, as minute as the details of an isolated statue; there must be a proportion between the importance of an event and the amount of details bestowed upon it. My attention ought not to be too much drawn to some points, and ought to be concentrated on some capital events. If any reproach could be addressed to the Comte de Paris, it would be for an excess of conscience which makes it difficult for him to neglect anything; he is afraid of showing any partiality—of appearing unjust to anybody. He takes the most extraordinary pains to collect information and to make his readers profit by all that he has acquired.

The third volume opens with a section which will be read with a peculiar interest, as the Comte de Paris was a witness and an actor in all the events he describes. It is the history of McClellan's campaign in the Virginian Peninsula. With its four chapters, entitled "Williamsburg," "Fair-Oaks," "Gaines's Mill," "Glendale and Malvern," it might form a separate book. It is by far the most dramatic part of the work, not only on account of the singular interest of its sanguinary conflicts, but also of the tone of emotion which pervades it. This unfortunate campaign was the first in which the Comte de Paris was engaged. He must have had all along the keenest feeling of curiosity, and his vivid descriptions show how well his mind preserved the image of the battle-fields on which his spurs were won. He always speaks with affection and gratitude of his chief, General McClellan, but his love of truth sometimes forces from him declarations which show how much McClellan was wanting in some of the qualities of the great strategist or tactician. When the army arrived before Yorktown, nobody was there but Magruder with a very small force; he had remained contrary to orders, and contrived, by placing his men with great art, to make McClellan believe that a large army was before him. "Deceived by appearances," says the Comte de Paris, "McClellan thought that he should find behind these mysterious forests the Confederate army which a month before had evacuated Manassas, and he dared not give the sabre-stroke (*coup de sabre*) which would have torn the frail curtain spread before his eyes by a clever adversary." Magruder, though he disobeyed his orders, enabled General Johnson to leave the Rapidan, to send some of his forces to the Peninsula, and to concentrate the rest round Richmond. After two weeks of delay, McClellan commenced the attack against Yorktown.

The bloody conflicts of Fair-Oaks are narrated with much detail. General Sumner had, with much pains, succeeded in crossing the Chickahominy, which was rising and threatened to destroy the bridges thrown across by the troops. Here, again, I will quote the opinion of the Comte de Paris:

"Half the Federal army remained inactive when it might have transformed into victory the battle of Fair-Oaks. General McClellan had indeed felt how important it was to help Sumner by a movement of all his right wing. From his headquarters at Gaines's Mill he saw the smoke, which rose above the trees, tracing the undulations of the battle-field and marking the constant progress of the enemy. He had two army corps under his hand. Before him the Chickahominy, though rising, was still practicable; two bridges, already much advanced, could be finished in a few hours; on the opposite hill, which commanded this approach, there was no work of the enemy; we saw only, on the most prominent parts of the plateau, one or two regiments which went to and fro with a suspicious ostentation. McClellan could have left a division with the great park of artillery and the dépôt, and with three others he might, in the neighborhood of New Bridge, have fallen on the Confederate flank. . . . All was ready for this movement, when McClellan consented to wait till next day. It was a great misfortune for him, as he thus lost a *unique* occasion in the course of the campaign."

The sanguinary battle of Gaines's Mill obliged McClellan to lead his army across a most difficult country to the James River, which was a safe line of communication; and the Confederates suffered a crushing defeat at Malvern Hill. The Confederates, inflamed by their first successes, hoped to force McClellan and his army to capitulate; but their hopes were frustrated; McClellan had only shown Richmond to his army and had not been able to enter it; but once on the James River he was perfectly safe, and the Southern army suffered severe losses.

The second book of the third volume contains the account of the naval operations before New Orleans, Memphis, Vicksburg, and Fort Pulaski; the third brings us back to Virginia and to Maryland, and ends with the battle of Antietam, which put an end to the invasion of the latter State. The Comte de Paris says that on the morning of that great battle McClellan had at least 50,000 combatants, while General Lee had only 25,000. The losses on both sides were enormous; and the victory of McClellan, in the opinion of the Comte de Paris, would have been much more pregnant in its results if General Burnside had moved with more rapidity. "We insist upon his slackness not only because it lost for McClellan all the fruits of his victory, but also because it shows the difficulties which, in improvised armies, lie in the way of a commander's combinations. The example is all the more instructive as Burnside was a personal friend of McClellan, and a very brave and loyal officer, who had shown at Roanoke a true military capacity." At the end of the battle the two corps remained inactive when their action would have been all-important, because McClellan was deceived as to the number of his enemies (in his official report, he estimates their number at 97,000 men), and was wrongly convinced of the necessity of keeping troops in reserve. "Still," says the Count, "if Burnside had followed more exactly the instructions of his chief; if he had in the morning made a general attack; if, after having crossed the Antietam, he had not waited two hours before taking the offensive, he would certainly have placed Lee in a most perilous position." These two hours gave Hill time to arrive from Harper's Ferry and to take part in the action. Lee, nevertheless, had suffered a great defeat, and was obliged to retreat. Washington was no longer threatened and Pennsylvania was protected. Twenty thousand men, killed or wounded, remained on the narrow battle-field; and the sacrifices of the Northern *corps d'armée* had been so severe that McClellan may be excused for not taking the offensive immediately. General Lee silently retired to Virginia in perfect order, but with a diminished army and without having attained his object.

The fourth volume begins with an account of the now-forgotten operations in Kentucky and in Tennessee. It is perhaps a pity that this part of the work is not a little more condensed; these lateral operations, if I may call them so, could have no decisive character, and the reader will always return with pleasure to the incidents of the great duel between the armies which defended and threatened in turn Washington and Richmond. I remembered, as I read the chapters on Fredericksburg and on the useless efforts of Burnside and Hooker, the dark hours when it almost seemed as if a decisive victory would ever be refused to the North. The end of the fourth volume, under the title of "Politique," is a most interesting and elaborate account of the political difficulties which were, from the beginning to the end, connected with the history of the war. These difficulties came from the outside and from the inside; the blockade of the Southern ports and coast at once gave rise to the most perplexing international questions. The history of the Confederate privateers will be found related with the most minute details in the work of the Comte de Paris.

"As for the *Alabama*," writes the Count, "its career was from the beginning a perpetual violation of the law of nations. As soon as it was armed, this ship, constructed in England, armed with English guns, and manned, with a few exceptions, by Englishmen, began its campaign without being registered in a Confederate port. The Americans did not much exaggerate when they called it an English pirate, and they were in the right when they asked the British Government to seize her as soon as she arrived in an English port. They were not heard. The *Alabama* went to Nassau, and encountered the most friendly treatment from the authorities. The international law only allows a belligerent steamer a certain amount of coal, calculated upon its distance from the nearest ports; but Semmes could at Nassau embark as much coal as he liked. In the last three months of 1867 the *Alabama* destroyed twenty-eight large merchant-ships. After having burned them, she kept their chronometers as trophies, and brought their crews either to the Bermudas or to Nassau, where she was always sure to find aid and protection. . . . Marine insurance soon rose to such a point that the Americans were obliged to denationalize their merchant fleet, and it was forced to take the English flag."

The Comte de Paris writes a long chapter on the laws which the war made necessary. He shows what measures were taken by the Governments at war during the first years of the struggle in order to raise their large armies and to provide them with all the necessaries and accessories of war. I am not aware that the history of all the war measures of Congress has ever been condensed before, at any rate in such a complete and systematic manner. There was one great war measure which deserved the special place which the Comte de Paris has given to it. His fourth volume concludes with the history of the great struggles which ended in the proclamation of emancipation.

"Notwithstanding," says the Comte de Paris, "the prudence of his language, the President did not conceal on which side were his convictions; but he was not carried away by his anti-slavery opinions, and he thought only of his special mission—the maintenance of the Constitution and the re-establishment of the Union. He did not believe that he had the right to compromise this end either by a premature abolition or by an excessive respect for the Southern institution. Like an experienced pilot, he observed, with his hand on the helm, the direction of the high winds which pushed the ship confided to him. As soon as he made up his mind, he assumed bravely the responsibility of his act, and executed it with resolution. We believe that he chose the opportune moment; it was the day after the victory of Antietam, and this great decision was an answer to the invasion of the loyal States by the Confederate armies."

I take leave of this great work with regret that a meagre review cannot do full justice to its exhaustive, conscientious character. The task which the Comte de Paris has undertaken is a very hard one, and thus far he has accomplished it with great success, and we can only hope that he will be able to bring it to its termination.

## AUSTRALIAN PARTICULARISM.

MELBOURNE, May 17, 1875.

THE past two months have been barren of incident. Parliament is not sitting, and there has luckily been no tragedy of exceptional interest like the wreck of the *Gothenburg*, which I described in my last letter. But there has been much political discussion on matters that will one day be of great importance. For nearly a year past active public men in Victoria and in New South Wales have been devising schemes that Australia may be adequately represented at the Philadelphia Exhibition. The Commission in Melbourne determined to recommend a preliminary exhibition within our own limits, and not unnaturally thought that Melbourne, the largest and most central town, would be the best place to have it in. Their chairman, Sir Redmond Barry, whom you will probably see in America as representative of Victoria, wrote in this spirit to Sydney. I think it probable that Sir Redmond, who is a pompous and not very wise old gentleman, had irritated his colleagues in the sister colony by some faults of manner. Anyhow, his letter produced an explosion of wrath, in an answer which has since been disavowed as "not intended for publication," but which, nevertheless, appears to express the feelings of many people in New South Wales. I pass over the personalities in which Mr. Joubert, the secretary of the New South Wales Commission, has indulged, as they only show individual bad taste. What has impressed me most is the outburst of the narrowest local feeling. "Though we may love Australia much, we love New South Wales more." "We do not see that New South Wales has any nationality beyond its own nationality, and we do not say this in any selfish spirit, but with the view that any merit New South Wales may possess may not be absorbed in other nationalities." Accordingly, the government of New South Wales has resolved to have a separate exhibition in Sydney. Meanwhile, the Queensland government follows suit by voting a grant of money toward the purposes of the Philadelphia Exhibition on condition that nothing sent from Queensland be first exhibited in Melbourne. Curious, is it not? Here are some half-a-dozen colonies settled within a century, and mostly within forty years, by men of the same race, language, and religion, with none of the differences that distinguished New

England from Virginia, and with scarcely any division of interests. Yet were the British Government to attempt to join any two together, it would, in all likelihood, provoke a rebellion, and no one talks of a federation but as a dream of the future. We call ourselves Australians abroad, but are as jealous for our special colonies here as if each were a great nation with a separate history.

More important to us in Victoria just now seems the question in what way we are to increase our taxation. We have a revenue of about four millions a year. Of this less than half comes from taxes, the remainder being derived mainly from sales of lands and railway receipts. As our population only numbers 800,000, we may fairly claim, I think, to pass for a rich community, and we have not yet exhibited our ignorant impatience of taxation. But our form of government is costly and our real wants great. Need I tell you that in a country with universal suffrage every district claims its share in the public expenditure, and every unemployed man expects a billet on the Government works? We have lately introduced a system of free and compulsory education. It has met with friends and foes alike of the right sort, and within about two years has taken a fast hold on the population. If the compulsory clauses in it are enforced, which has not been the case hitherto, it will, I believe, go far towards training up an intelligent and law-abiding people. But the experiment is a costly one, as the state has to build schools over a country as large as Great Britain. We are therefore just now in exceptional need of money, and, as it happens, the revenue for the year shows signs of decrease, especially in the customs duties. The contrast with New South Wales, which shows a surplus of £800,000, is a little humiliating, but the causes are not far to seek. Our gold-fields are yielding less than they did; the better half of our public lands has been alienated; and our industry is crippled by heavy protective duties of the most foolish kind. Wise legislation might open purchased lands to the gold-miner, might obtain a higher price for the unsold lands and would undoubtedly consign the whole existing tariff to the flames. But no party is strong enough to legislate wisely, and our statesmen must content themselves with deliberating in what way a new tax may be imposed.

Victoria is not the only colony in these parts that has been spending a little too freely. In South Australia, a small but very prosperous colony, the ministry have contrived to anticipate a rapidly-rising revenue to a rather serious extent. Probably both colonies will soon figure again in the London market as borrowers. The fact is, our public men out here are all more or less demoralized by the example of New Zealand. That erratic little federation, for it can scarcely as yet be called a colony proper, has been afflicted with every species of experiment that the British Government or the madness of projectors could inflict upon it. It has had an Anglican settlement on High-Church principles at Canterbury, and a rival settlement under the auspices of the Scotch Kirk at Dunedin. It has had and has survived the Wakefield system. It was defended for some years at a cost of several millions by the Home Government, and has been allowed to defend itself, with the curious but not unnatural result that the war almost instantly collapsed. Moreover, it still boasts a constitution in which the principle of self-government has run mad, so that every province has a separate governor, and almost every district a town-council. Lately, it has been dominated by a gentleman of an audacious genius for finance, who may rank in his small way with projectors like Law and Mirès. Mr. Vogel, a German Jew by extraction, who owed his rise in the first instance to his ability as a speaker, came into power in New Zealand at a time when the province seemed to be hopelessly crushed by the large public debt, incurred chiefly for the Maori war. He saw that it was as easy to fail for a large as for a small sum, and more creditable; and at once instituted a system of borrowing on a colossal scale. The money obtained in England is spent partly on public works, partly on bringing out immigrants, and partly, unless I am much mistaken, in paying interest to creditors. You will have seen the controversy he has lately waged on the subject with Mr. Fellows, in *Fraser's Magazine*. Knowing something of New Zealand as a traveller, and having talked much with those who belong to it, I can only say that I regard the island as hopelessly bankrupt. There is already an acknowledged debt of nearly fifty pounds a head, or about twice the proportion owed in Great Britain; and for this there is nothing to show but a few short, unconnected, and partly unfinished lines of railway. The last loan of four millions has been raised at a considerable discount (91); and the New Zealand correspondent of the *Argus* is obliged to admit that "not to have got it would have involved a suspension of public works, and meant ruin." Meanwhile, all classes in New Zealand are delighted with Mr. Vogel's policy. It is a millennium of contractors, laborers, tradesmen, and land-jobbers; all the more so as every province is copying the example set by the central government, and is raising and spending money recklessly. New Zealand is so rich in natural resources that I have some faith in her pulling through ultimately, especially if the crash comes soon. But if her example should infect us on the continent, the consequences will be very disastrous; for our credit stands high, and our natural wealth is, I think, not so great as New Zealand's. I do not suppose either our public loans or the shares of our private companies are likely to find their way to the New York market; but if they should ever come there, the American public will do well to beware of them. We are a singularly wealthy community, often troubled with having more capital to invest than labor to purchase with it, and so thrown upon land-jobbing, stock-jobbing, and other such reservoirs and outlets of accumulated wealth. Given a sound speculation it will always find subscribers, who will only want a little more than English rates of interest. A speculation must be very rotten indeed before we admit our friends in England to a share in it; and from what I know of their trustfulness, they will take all that has any element of good.

# Notes.

D. VAN NOSTRAND & CO. have assumed the publication of Major Geo. H. Elliot's valuable report to the Treasury Department on 'European Light-House Systems.'——Bachelder's 'Popular Resorts, and How to Reach Them' may be recommended among summer guide-books for its abundance of information, fair map, and very good and numerous woodcuts. It will hereafter be made an annual publication, with additions and revisions (Boston: Lee & Shepard).——Bradley, Garretson & Co., Philadelphia, have procured the English plates of the Rev. J. G. Wood's 'Bible Animals,' and made a reprint from them, to which they have added specially prepared articles by Dr. McCosh ("On Evolution") and by Dr. March ("On Research and Travel in Bible Lands"). Dr. McCosh concludes that "we do not as yet see all things reconciled between these two sides—the side of Scripture and the side of science; but we see enough to satisfy us that the two correspond." Dr. March in like manner says: "Let the naturalist trace connection and development along all the ascending grades of being from the floating slime of the sea to the full-formed and perfect man. . . . Still the one book of divine revelation shall be in harmony with all truth."——F. Leypoldt has in press 'The Stationers' Hand-book for 1875-6,' edited by H. D. Monachesi and Albert B. John. It promises to be very useful to the trade.——Bulletin No. 34 of the Boston Public Library devotes seven closely-printed pages to a comprehensive survey of the literature of the history of Boston during the Revolutionary period, beginning with the "writs of assistance" in 1761 and ending with the evacuation of Boston, in March, 1776. Somewhat more than two pages are similarly occupied with a directory to works on ornament and decoration. It is announced that the cards of the public card-catalogue will hereafter be printed in autograph fac-simile by Osgood's heliotype process.——The 'Transactions of the American Philological Association for 1874' have just been published. Of the eight papers printed entire, it is noticeable that at least five, and we should say six, would be proper contributions to a *Zeitschrift für Pädagogik*. Is not this a sign that such a journal could now be sustained by the colleges of the country, as abroad by the gymnasia?——We have been reminded that as Suetonius (Claud., 21) expressly records the incident *Ave imperator*, the statement that he does not, which, on the authority of the *Academy*, we attributed last week to Adolf Stahr, is certainly incorrect.

—The *Atlantic* for August contains as its most important contribution Mr. Lowell's poem delivered at Cambridge on the Washington centennial. This makes the third "occasional" ode which Mr. Lowell has within a few years written to commemorate important historical events, the other two being the "Commemoration" ode read at Cambridge at the end of the war, and the ode read at the Concord celebration in April last. They all necessarily relate to the same theme—the love of country and the duty of self-sacrifice—and yet it was equally necessary that they should be different. Such a test of originality as this has seldom, if ever, in recent times—that is, since the absolute duty of writing occasional poems ceased with the extinction of the old system of patronage—been put to any one; and Mr. Lowell has certainly survived it. There is quite as much originality in this last poem as in either of the other two, and though we shall ourselves always like the Commemoration Ode best, we cannot deny others the right to a different opinion. There are in the present poem, indeed, single lines that fasten themselves upon the mind with greater tenacity than any in the

Commemoration Ode—though we should maintain that there are whole passages in the latter, as, for instance, that beginning

"Some day the soft ideal that we wooed,"

which are finer than even the most terse and incisive single line can be. Besides Mr. Lowell's poem, there are a number of articles which are sure of attracting attention, particularly the opening chapter of Mrs. Kemble's "Old Woman's Gossip" and Mr. D. A. Wells's article on Free Trade.

—*Scribner's* has a good article by Colonel Waring describing the little-known Channel Island of Jersey, but the brilliancy of the *Atlantic* obscures this and most of the other magazines of the month. The *Galaxy* is not remarkably interesting, and neither "Nebulæ" on the Beecher Trial nor "Driftwood" on the Centennial—or, as Philip Quilibet prefers to call it, the centenary—has that startling interest which we always expect the "end men" of a magazine to develop. Whether the same causes which have such a bad effect on the newspapers in summer also affect the magazines, we do not know, but we should hardly think they ought to. The annual recurrence of the "silly season," as it is called in England—and the readers of editorials on "Tottie" and "Bobbie" and "How shall we dine?" and "New York as a Summer Resort," and on "Earnestness," "The Little Ones," and "The Star System," know that it is not an entirely transatlantic division of the year—is due to the fact that an editorial page must be filled both summer and winter at any cost, and that in summer topics give out, though the space to be filled does not diminish. There is a real difficulty about writing editorials at a time of year when no events worth speaking of happen, which must tinge the vexation of the thoughtful reader of newspapers with a sort of pity for the overtasked brain of the poor devil of a journalist, but there is no such excuse for the magazines. The magazine editor is not a person who must discuss topics of the day; he may print anything in the world, on any subject under heaven, from a review of Mr. Gladstone's theological writings down to a contribution from Josh Billings; he may print an article on hanging when no one is under a sentence of death, on ice in the middle of summer, on the scenery of Manila when no one is caring or thinking about Manila, and a serial story by any author of any country or degree of fame. Besides this, he has the names of his contributors to display, and altogether, with these manifold advantages over the journalist, he must be held, it seems to us, to a rigid accountability at all seasons of the year. Because this is a dull time of year, and nothing is going on, is all the more reason for him to exert himself. We therefore must hold up the August number of the *Atlantic* to the emulation of the other magazines, and trust that their editors will not again allow the comparison to be so glaring.

—Little, Brown & Co. have received and have sent us the second volume of the new 'Encyclopædia Britannica' (Anaxagoras—Athenry). It is rich in contributions from England's most distinguished specialists, and is especially strong in the department of science. Here, for example, we have articles on the Animal Kingdom, by Huxley; on Anthropology, by E. B. Tylor; on Apes, freely illustrated, by St. George Mivart; and on Astronomy, by Richard A. Proctor. The last-named topic, together with Astrology, occupies eighty-five pages. The art of war, as discussed under Arms and Armor, Army, Arsenal, and Artillery, fills an equal space. Arboriculture, Archæology, and Anthology are also treated at some length. The leading geographical articles are Asia, Arabia (by W. Gifford Palgrave), and Argentine Republic. The author of the last-mentioned article makes the ill-considered statement that the Argentine Republic's "extent in latitude is greater than that of any existing country," excepting the barren foreign regions of British America and of the Russian Empire. He arrives at this conclusion by conceding the Republic's claim to the whole of the Patagonian territory; but even so he cannot reckon more than 32 degrees between the Bolivian frontier and the Straits of Magellan. Now, Brazil extends 34 degrees south of the equator, besides 4½ degrees to the north of it. Arizona and Arkansas fall within the present volume, as do also the Appalachian Mountains; and American affairs are incidentally alluded to under Aqueduct—where the Croton is described and figured—under Army, where the enormous muster on both sides in our civil war, and the rapid dissolution of our forces at the close, are remarked as amazing—and under Architecture, where to make amends for ten lines of text (perhaps as much as we deserve for public buildings) the Capitol at Washington is well pictured. The article on Architecture is, indeed, the *pièce de résistance* of this volume, occupying nearly 100 pages, or an eighth of the whole. It is the joint work of Prof. T. Hayter Lewis and George Edmund Street, and is, as might be expected, an admirable performance. A few paragraphs at the beginning are devoted to the nature and theory of architecture, a few towards the end to its present position; and at the very end a chapter on the application of color to architecture has the effect if not the intention of a stimulus to the profession. The rest is systematically historical. The following pleasantry on modern architecture is worth quoting:

"We need scarcely add that it is developed in every conceivable style. If a church is to be built we may, indeed, pretty safely predict that it will be in one of the many pointed styles, but even then it may be English, French, or Italian. But of any other kind of edifice no one could safely predict the style. Probably it might be safe to assert that a theatre would not have (as Covent Garden in London had) a Grecian Doric portico, or an Egyptian pylon be made to do duty (as in Piccadilly, London) for a couple of shops. One might also be tolerably sure that a monument to a distinguished person would not be a granite column with a staircase up the middle, and a statue almost out of sight, with a lightning conductor through the head at top (as at the Duke of York's column, London). But short of this, almost any prediction as to the style might come true; and as nearly every building of note throughout the world is brought to the eyes of the public by means of engravings or photographs, there seems little chance of its being otherwise."

The whole subject is judiciously and copiously illustrated with woodcuts, and also with several steel plates, of which the volume has twenty-five in all, including maps of Arabia and of the Argentine Republic. Distinctively British articles are those on Archery and (for the space allotted to it) Annuities.

—'A Report on the Hygiene of the United States Army,' with descriptions of military posts, is promulgated by Circular 8, Surgeon-General's Office, 1875, in a volume of nearly six hundred quarto pages, with a skeleton map and many cuts. This description of posts, skilfully compiled and condensed by Assistant-Surgeon Billings from the regular and special reports of the medical corps, is a valuable medical geography of the country; and, in addition, has a very practical use in acquainting officers ordered to new stations with their respective peculiarities. In this regard it is a topographical directory and military guide-book, being a later and revised edition of Circular 4, 1870, which we noticed when issued. It has, besides, a special value to the civil sanitarian in, among other matters, the discussion by a number of independent observers of the fitness of the regions bordering the Rocky Mountains for consumptives, the general conclusion which is reached being that the dryness of the air and the incentives to outdoor life are the essential hygienic elements. But the cream of the volume is Dr. Billings's own paper on Military Hygiene, which, including the special reports and orders on which it is partly based, takes up fifty-five pages. It might well be reprinted as a monograph for frequent consultation by both line and staff. His premises are unimpeachable, his conclusions are well defined and fairly drawn, and his style is a model of clearness and force. Dr. Billings believes that the service loses annually one hundred men by death and two hundred men by discharge for disease from preventible causes. Of these he reckons one-third as lost by overcrowding and by badly-ventilated barracks and guard-houses. Those familiar with the army know that the arms and accoutrements, and usually the quarters, are models of neatness; but intelligent observers have long been aware of what these reports clearly demonstrate, that personal cleanliness is often maintained with great difficulty, from the utter want of provision for bathing, and that the men are frequently packed into the most unsanitary barracks. He remarks with much force: "A dirty man will, in most cases, be a discontented, disagreeable, and dissolute man; for the condition of his skin has much more to do with a man's morals than is generally supposed." And, "no real saving is effected to the Government by expending the health and lives of its employés instead of sufficient money to allow them to have a sufficient supply of fresh air." It is a common belief that ours is the best-fed of all armies, but a careful calculation made by Surgeon Perin, embodied in the report, shows that the ration does not fulfil the physiological indications; and his recommendations for a definite increase and redistribution of its constituents are adopted. A few technical changes, that on their face appear reasonable, are also proposed.

—On the subject of clothing, opinions of commanding-officers given in compliance with a recent order are summarized, from which it may be pretty clearly inferred that, although there has been considerable improvement within a few years, the standard of ordinary commercial honesty, to say nothing of hygienic fitness, has not yet been attained in the quality of many articles. "Practically, the soldier purchases much clothing from traders, in order to protect himself against extremes of temperature, which cannot be done by the exclusive use of articles furnished by the Government." It is a pity that the reporter has allowed this important subject to pass without vigorously asserting the hygienic unfitness of much of the clothing for the work expected of its wearers. In the matter of hospitals, Dr. Billings is a recognized expert, and he observes that the question, "What is the best plan for an hospital?" is often asked, as if but one set of conditions

were possible. The fact is, that hardly any two hospitals can or should be alike. Most of the military hospitals are small wooden structures, designed to last ten or twelve years, and those lately built are very suitable. He describes the newly-erected fifty-bed hospital at the Soldiers' Home as an attempt to solve some of the problems of civil-hospital construction. This presents certain novel and apparently useful features, especially in the arrangement of the domestic offices and in the ventilation, which we have not space to analyze here, but which the constructors of permanent hospitals on limited ground would do well to examine. For reducing to their lowest terms the formulæ of some very difficult problems this essay should take a high rank, and the Surgeon-General and his corps are to be congratulated on the possession of so acute an analyst. The quotations from the reports of Drs. Smart, Bill, Perrin, and Smith, incorporated in Dr. Billings's paper, as well as many of those which make up the descriptions already referred to, give renewed evidence that many members of the Army Medical Department are of more than ordinary culture in their profession.

—The life of Bishop Thirlwall, or more properly the Right Reverend Connop Thirlwall, Bishop of St. David's, was so uneventful as to make his biography little more than a catalogue of his writings. Of them, of course, the most important was his 'History of Greece,' though at the age of eleven the future historian gave early proof of his interest in and fitness for literary work by a volume called 'Primitiæ; or, Essays and Poems on Various Subjects—Religious, Moral, and Entertaining. By Connop Thirlwall, eleven years of age; the preface by his father, the Rev. Thomas Thirlwall, M.A., etc., etc. 1809. 12mo. Printed for the author.' This was followed in 1825 by a translation of Frederick Schleiermacher's critical essay on the Gospel of St. John, with an introduction by the translator; and this again by the 'History of Greece,' which would to-day probably be the standard modern history of the country to which it relates had not Grote already begun to work upon the same subject. Thirlwall's history has, probably, suffered unjustly in popular estimation through the brilliant success obtained by his successor, but it is a mistake to suppose that one supplants the other. It is really Mitford who has been supplanted both by Thirlwall and Grote, the latest of the three having in the preface of his own work paid his predecessor the high compliment of saying that had Dr. Thirlwall's history appeared a few years earlier, he probably would "never have conceived the design of the present work at all." Grote was impelled to his undertaking by the sense of the unfairness and partisan character of Mitford, who had the historical spirit in about the same degree that it was possessed by Alison, or let us say Walter Scott; and if a fault is to be found with his history, it is that the author was at too great pains to show the other side—the bright side of Athenian democracy. Dr. Thirlwall had no party spirit, and on the whole we may agree with the German criticism on both of them taken together, that they are "two English works on the history of Greece such as no other nation can boast of." Dr. Thirlwall first published his history as a contribution to Lardner's 'Cabinet Cyclopædia' in 1835 *et seq.* He was called to the bar at Lincoln's Inn in 1825, but abandoned the profession three years later, and became rector of Kirby-under-Dale in Yorkshire. He was born in 1797.

—The "General Medical Council of Education and Registration" includes representatives of all the medical colleges and licensing bodies, as well as of all the universities, of England, Ireland, and Scotland. The interests of the crown and of the public are also represented by six delegates of the Government. The Council make a register of all legally-qualified practitioners, see that the examination tests are sufficient, and provide a list of drugs and medical preparations as a standard by which medical prescriptions are to be dispensed. No practitioner whose name is not on the register can enter any of the public services, nor can he recover debts at law for medical assistance. During the latter part of June, as we learn from the *Pall Mall Gazette*, the Council have been debating, by request of the Government, the propriety of assenting to Mr. Cooper-Temple's bill for registering foreign degrees of women from certain eminent universities which at present admit them to study and graduation, and, besides this, the whole question of the advisability of admitting women to the study and practice of medicine, and of enabling them to obtain "registerable degrees or licenses." A report from a special committee of review was adopted by a majority of two-thirds of the Council, which cautiously declared that, notwithstanding there are in the opinion of the Council special hindrances to the practice of medicine by women which cannot safely be disregarded, the Council is not prepared to say that women ought to be excluded from the practice of medicine. At present there is no licensing body or university which admits women to examination; and the one English lady registered as a practitioner was admitted to examination by the Society of Apothecaries, who thereupon devis a means for barring the door against other medical aspirants of the other sex. Mrs. Anderson had passed by means of instruction obtained by "authorized lecturers" in full courses of lectures specially delivered for her behoof. The Society have now resolved that they will admit no one to examination who has not attended the lectures "in a recognized school." Dr. Parkes, one of the heads of the English medical profession, with Professors Humphry and Rolleston, were the most earnest advocates among the General Medical Council for the admission of women to the register. Dr. Wood, of Edinburgh, emphatically warned the Council against giving even a negative encouragement to women to enter on a career which required such qualities as strength, endurance, the power to witness scenes of suffering and of blood, and others which are equally foreign to the female character, while it tended to force them into situations destructive to female modesty and delicacy. Mr. McNamara, of Dublin, contended that there is nothing which a lady must witness or take part in as a doctor which she does not witness and take part in as an hospital matron, lady nurse, or Sister of Mercy; that experience had shown that such duties were no more injurious to the finer feelings of women than of men; that there were few operating theatres in which ladies now did not render calm and effectual aid, and those who did so were acknowledged "to be among the noblest specimens of womanhood." The result is that the Council intimate that if any of the nineteen licensing bodies in the United Kingdom choose to admit women to an examination, they, the Council, will be happy to register the license so granted. But if not, then the Council suggest that a special examination be instituted and placed by authority under their supervision, with power to register the certificates granted as licenses to practise medicine. The women, it seems, prefer the standards by which men are tried. The Government, accordingly, have now to ascertain, before further legislative action, what are the intentions of the licensing bodies.

—Next Tuesday (August 10) the founder and Nestor of the "Science of Judaism," Leopold Zunz, will celebrate his eighty-first birthday. It is gratifying, in connection with this statement, to be able to announce that the first volume of his 'Gesammelte Schriften' has recently left the press (Berlin). As early as in the year 1818, Zunz published 'Etwas über die rabbinische Literatur,' and drew, even then, with a master-hand the outlines of an exact, scientific treatment of Jewish literature and history. He subsequently edited a *Journal of the Science of Judaism*, published his master-work, 'Die gottesdienstlichen Vorträge der Juden,' his instructive book, 'Zur Geschichte und Literatur,' various volumes on the history of the liturgies and rituals of the Jews, a number of smaller works, and of learned papers printed in divers periodicals. In all his numerous writings he has avoided hollow phrases, shallow declamation, and subjective "gushing," and has ever been eminently objective and exact. We may conclude this note with a word of Steinschneider's: "To praise the writings of Zunz would be an offence to our readers."

—Another exact writer on Jewish matters is the Rabbi of Szegedin, Leopold Löw. Jewish archæology, in its widest sense, is the province of this great scholar. While Frankel, Fassel, and others have written in a dogmatic and unhistorical method on "Mosaico-Talmudical law" (a peculiar designation, which in itself involves an unscientific idea), and thereby led their confiding readers to the false conclusion that the law as laid down in the *Shulchan Aruch* had been invariably the law in all the centuries from Moses to the present age; while Ewald, De Wette, Saalschütz, and others treated in a similar manner of the Biblical and post-Biblical archæology of the Israelites, and thus confounded the different epochs of history, Löw has followed another and a more correct method. In every instance, he examines the historical development, pursues it from period to period and from century to century, and, with an erudition rarely to be met with, shows what variations and alterations have taken place in the course of time. His most recent book ('Die Lebensalter in der jüdischen Literatur,' Szegedin, 1875) is another of his many valuable contributions to the history of the inner life of Judaism. In this work, the author discusses individual man in his different stages of life from the standpoint of Jewish law, custom, liturgy, and ritual, and by this treatment succeeds in keeping the various periods of history distinctly separate. Besides Rabbi Löw, there is in the Austrian empire another great Jewish savant, Mr. O. H. Schorr, in Brody. There can be no question that Löw and Schorr are the two most eminent Jewish scholars of the present time in all Eastern Europe. Mr. Schorr is the author of the 'Hechalutz,' a collection of learned papers, written in a fluent and beautiful Hebrew, on Jewish history, literature, and archæology. The ninth volume of the 'Hechalutz' (the last thus far) appeared in Prague in 1873, and contains a number of articles of high merit on the proper nouns

in the Talmud, on rabbinical etymology and mediæval Hebrew poetry, also reviews of Schatzke's 'Mafteach' and of Bober's edition of the 'Pesikta.' It must suffice here to have called the attention of the friends of Jewish literature to Schorr and his exceedingly interesting and instructive *annuaire*.

## GARDINER'S CHARLES I.*

MR. GARDINER'S work is characterized by a spirit of laborious research and studied impartiality. Of the first characteristic no praise can be too high. To investigate original authorities, to discover, where possible, new facts, to deem no labor too great by which an error, however small, may be corrected, is the primary duty of an historian. History, it can never be too often repeated, is a court always open to the reception of new evidence and always prepared to revise a verdict on the production of new facts. Generalization and the promulgation of so-called historical laws have their place in the work of an historian, but these laws themselves are nothing but convenient formulas for the summary statement of facts, and must themselves be modified whenever shown to be inconsistent with any well-established discovery. As experiment is the life of physical science, so investigation into authorities is the very soul of history. The writer who produces new facts or brings forgotten facts into prominence supplies at once the test by which received beliefs may be confirmed, and also the only means by which such beliefs can be permanently modified.

In both these respects Mr. Gardiner's research has done good service. The general effect of his last two volumes will be to confirm the estimate of Charles and his opponents which is current among all candid enquirers. That Charles was, though not the worst man, yet nearly the worst ruler who ever sat upon the English throne; that his reign was from its beginning to its close a series of blunders, and of blunders which might have been avoided even by kings who have never ranked high among statesmen; that, on the other hand, the great merits of the Parliamentary leaders were mixed with some great defects, and that neither Charles nor his opponents saw, in the earlier stages at least of the struggle, either the exact nature of the crisis or the precise mode in which the difficulties of the period ought to be met, are conclusions which have been long formed by competent judges, but which receive the strongest confirmation from Mr. Gardiner's work. It is, however, certain that if Mr. Gardiner leaves our general view of the period undisturbed, he does a good deal to modify received impressions as to details, and does something to put the character of the statesmen of the time in a new light. Few persons, for example, are fully alive to the momentous importance of the years 1624–1628 in their bearing on the Revolution to which they formed a prelude. Mr. Gardiner makes clear even to the most ignorant reader that before Charles ascended the throne he was involved, mainly by Buckingham's folly and his own incapacity, in a maze of political complications out of which it would have been difficult for a man with a clearer head and more determined will than Charles to have found his way with credit. Mr. Gardiner also establishes past a doubt that neither the Court nor the patriots understood the state of the Continent, and that this ignorance caused the most hopeless blunders in the conduct of foreign affairs. All parties wished to do something for the cause of foreign Protestantism, but no man, unless it were possibly James I., seems to have even half realized the difficulty of interfering with effect in the European war, and James I. lacked the resolution to follow the dictates of his intelligence. The Parliament wished for a war with Spain. The Court at first aimed at an interposition in Germany. Buckingham, who really ruled the country, wished to achieve some great political triumph which might redound to his own credit and that of England. How this long game of cross-purposes led, as was natural, to the ruin of England's allies, to the discredit of England's name, and, it may be said, to the death of Buckingham, is made clear to all who read Mr. Gardiner's pages, and can scarcely be understood by any one who has not waded through the details of blundering intrigue which these pages record.

These details certainly modify the impression which has been formed of Buckingham. He was not a mere favorite; "but if it is just to class him amongst ministers rather than amongst favorites, he must rank amongst the most incapable ministers of this or of any other country." His incapacity seemed to the men of his age even greater than it was, since they did not or would not acknowledge that for the errors of Buckingham's policy the king was fully as responsible as the minister. With that tendency to cling to fictions which has always been the weakness of English Liberals, the patriots of 1628 deceived themselves into the belief that nothing but the arts and fascinations of the favorite divided the king from his people. The intense hatred of Buckingham, which made even good men applaud the crime of Felton, can only be understood by recalling the veneration for the crown which made even patriots trust that the king was all wisdom and goodness, and that all the wickedness and folly of past misgovernment could be laid on the duke. Before Buckingham's death, indeed, statesmen had begun to perceive that the removal of the favorite would not be a sufficient cure for the diseases of the state; but even in 1628 few persons had detected all the defects of Charles. Alexander Gill, who shocked Oxford fellows by saying, "The king is fitter to stand in a Cheapside shop with an apron before him, and say 'What lack ye?' than to govern a kingdom," must have been a man of insight; for the net result of Mr. Gardiner's careful and not unfriendly study of the king's character is that his great fault was (to call things by their plain name) stupidity. The most envenomed partisanship could hardly have stripped Charles so completely of the halo with which false sentiment has crowned him as the impartial candor of Mr. Gardiner. Whoever wants to see Charles as he was, and not as he has been painted, should read the history of his married life. His marriage contract involved a breach of faith either with his people or with the French king, and Charles so mismanaged matters as to break faith with France without conciliating the good opinion of his subjects. This may be thought a matter of high politics, in which any man may blunder; but it does not require the wisdom of a statesman to avoid scenes such as that described in the following passage:

"For three days Charles kept entirely aloof from his wife, waiting sulkily till she should come and beg his pardon. . . . She sought him out and asked him in what she had offended him. He expected her, he answered, to acknowledge her error. . . . Would he not tell her what her fault had been? The question seemed to take him by surprise. After some hesitation he said: 'You told me that it rained when I said it did not rain.' 'I should never have thought that to be an offence,' she replied; 'but if you think so, I will think so, too.' Pleased with such . . . humility, Charles took his wife in his arms and kissed her."

This passage is noteworthy. It exhibits the king's stupidity, combined with his liking for dishonest servility. His speech and Henrietta's reply fully explain how it was that Charles began as the despot and ended as the slave of his wife. His domestic troubles betray also his utter incapacity for upright dealing. The terms of the marriage were in effect that the king should protect the Catholics. He not only broke his engagement, but never was able to understand how either Henrietta or Louis should feel the breach a grievance. This trait is one of considerable consequence, for Mr. Gardiner obviously attributes the king's duplicity mainly to his want of clearsightedness:

"When he entered into an engagement, he either formed no clear conception of the circumstances under which he would be called upon to fulfil it, or he remembered too clearly this or that consideration which would render his promise illusory, or would at least, if it had been spoken out, have prevented those with whom he was dealing from accepting his word. When the time came for him to fulfil it, he could think of nothing but the limitations with which he had surrounded it when his word had been given. Sometimes he went still further, apparently thinking that it was right to use deception against those who had no right to know the truth."

These sentences exhibit the peculiar kind of impartiality which characterizes Mr. Gardiner's treatment of history. It is something different in kind from the attempt which must always be made by every conscientious historian to state the truth, and, as far as he knows it, the whole truth in respect both of men and of events. It means in Mr. Gardiner's mouth, and, what is much more than this, in his practice, the endeavor to stand aloof from all party sympathies and to judge of the actors in history from their own point of view. He attempts, that is to say, to be neither a Puritan nor a Cavalier, but to write of Eliot and of Laud in the same manner in which Eliot or Laud might have written of himself in a candid biographical confession. This attitude of sympathetic neutrality is connected with Mr. Gardiner's habits of patient enquiry. The more closely you study the details of a man's acts, the more the complexity of his nature becomes apparent to you, and the more difficult you find it to describe his course of action and motives in a few decisive sentences. The more, that is to say, the mass of evidence increases, the harder it becomes to sum up the case either for condemnation or for acquittal.

When it is admitted that Mr. Gardiner maintains with rare success the position of rigorous impartiality, a question arises whether "impartiality," as distinguished from the fairness which is the duty of every writer, is such an absolute and undoubted merit as it appears to Mr. Gardiner, and will be held by ninety-nine out of every hundred of his readers. In history, as in every other branch of knowledge, the object to be aimed at is the attain-

* 'A History of England under the Duke of Buckingham and Charles I. 1624–1628. By Samuel Rawson Gardiner.' London: Longmans & Co.

ment of truth. The position of a neutral and sympathetic observer is the right one for a searcher after truth if two assumptions be granted: first, that in revolutions one party is pretty nearly as much in the right as the other; and, secondly, that the right way to judge of a man is to try to look at him from his own point of view, and, borrowing an expression from the law courts, to "give him" in every questionable case "the benefit of the doubt." Now, both these assumptions contain an element of truth, but they are far from being absolutely true, and confidence in them may lead to as great error as can the unfairness of fanatical partisanship. In every great struggle, men good, bad, and indifferent will be found on each side, but in all the important contests which have divided mankind there is (if the facts can be ascertained) a discernible distinction between the right side and the wrong. That good men, for example, sided with Charles I. can be doubted by no one but a bigot or an ignoramus. But that, especially in the earlier stages of the contest, the goodness and the wisdom of the nation were enlisted on the side of the Parliament, seems to us, as it apparently does to Mr. Gardiner, as certain as anything can be about which sensible and good men as a matter of fact disagree. The Parliament, that is to say, were in the right, and the Court were in the wrong; but once admit this fact, and the attitude of "neutrality" becomes both artificial and out of place. It is both weak and unfair to talk of men whose conduct is, to say the least, misguided, in the language which you apply to statesmen whose conduct you hold on the whole wise and patriotic.

The attempt to estimate historical characters sympathetically is also open to a further objection. It is impossible really to know that one looks at events with the eyes of Charles, or Eliot, or Wentworth. The endeavor to do so involves an historian in a labyrinth of uncertain hypothesis, which is all the more misguiding because its true character often escapes both writer and reader. Nor is there the least reason to assume that the view which, for example, Charles took of events would be, even could it be actually known, the right or the true view; and the vain effort to deal sympathetically with individuals is certain to render an historian somewhat confused and uncertain in his judgment of men and parties. Take, for example, Mr. Gardiner's description of Charles's character, as an analysis of an at any rate possible character: it has great subtlety and even, it may be admitted, considerable value; but it conceals from careless readers the obvious and important fact that, whatever may have been the cause of the fault, Charles was a systematic liar whose word no man could trust. As another example, both of the good and the bad side of Mr. Gardiner's method, readers will do well to study his picture of Wentworth. The fact becomes, it is true, apparent that Wentworth's policy was never in perfect sympathy with that of the patriots amongst whom he was numbered. It is also clear that his disposition and talents fitted him for official rather than parliamentary life. It is easy, that is to say, to perceive how naturally he might glide to the side of the Court, and without any change of character pass from the position of an opposition leader to that of the minister who more nearly than any other statesman overthrew the liberties of England. But to account for a change is not to justify it, and Mr. Gardiner seems in this as in some other cases to forget that every crime which has been committed from the murder of Abel downwards, has in a sense been natural and could be accounted for by a sufficient knowledge of the criminal's character. Wentworth does not become the less a traitor to the cause of freedom because his treachery was connected with peculiarities of his character and position. The damning fact remains, and must for ever remain unchanged: the man who had led the patriots and opposed the Court accepted a peerage, took office, and devoted his whole talents to the service of the crown in its struggles with his former associates. "No word has been found too hard for the great apostate, the unworthy deserter of the principles of his youth. Those who have studied the true records of the session which had just come to an end (1628) are aware that he was neither an apostate nor a deserter." A study of Mr. Gardiner's account of that session will convince students that Wentworth, like all strong men, was true to himself, but will leave them in doubt whether Mr. Gardiner's impartiality comes as near the truth as the indignation which has branded Wentworth with the stigma of apostasy and desertion.

## EGYPTIAN HISTORY.*

DR. BIRCH has done so much good work, and his name stands so deservedly high as an Egyptologist, that it seems almost ungracious to criticise this effort to bring within the knowledge of the general reader the results of recent scientific researches into the mysterious civilization of the Pharaohs. Yet the very eminence of the author's name is likely to tempt many to procure his little volume in the hope of obtaining a clear and definite idea of what is positively ascertained with respect to the ancient Misraim, and it is our duty to warn the casual reader that he will vainly seek in Dr. Birch's pages for what he might reasonably expect to find. The book, in fact, has all the appearance of perfunctory labor, performed at the instance of an enterprising publisher, by a scholar annoyed at being interrupted in his original researches, and utterly careless whether the uncongenial employment either did credit to himself or was of benefit to his readers.

So careless, indeed, has been Dr. Birch, that one never knows whether a statement made on one page may not be contradicted on the next. His history opens (p. 23) with the unqualified assertion that "the first monarch of the country was Mena, or, as he is called in Greek, Menes," which hardly prepares us for the remark which we find on turning the leaf (p. 25) that Menes "must be placed among those founders of monarchies whose personal existence an enlightened criticism doubts or denies." Equally puzzling to the novice in Egyptology is the contradiction between the statement (p. 24) that "the dyke of Cocheiche," the "great work" of Menes, "still exists in the neighborhood of Cairo," and the declaration on the next page (p. 25) that "nothing known to have been made in the time of Menes remains." In a book which commences after this fashion, we ought not to be surprised to read (p. 73) of the famous Labyrinth of Amenemha III. that "according to Herodotus it contained 600 chambers, or rather passages, 300 of which were above the level of the ground, and as many below"; and then on the next page (p. 74), in an unnecessary repetition of the description, that it contained "a great number of chambers, according to the account of Herodotus, 4,500 above and below"; nor, further, that this gigantic construction is attributed to Amenemha III. on pp. 71–2, and to Amenemha IV. on page 75. Had any one but Dr. Birch informed us that Egypt was "exposed on the West to the incursions of the barbarians of Western Asia, whose only curb was the intervening desert" (p. 123), we might have been disposed to attribute the blunder to a dense ignorance of elementary geography, but in him the only explanation possible is careless indifference. So when (p. 177) he says that the "Egyptian vassals" of Assyria "were tired of their dependency on Egypt," we find it difficult to understand the process of thought which assigns that as a reason for their revolt against Assurbanipal of Assyria in favor of Tirhakah of Ethiopia. We may charitably believe that it is only a printer's, and not an author's, blunder which informs us that Necho II. (p. 187) "conceived the idea of joining the Mediterranean to the Dead Sea, now for the first time realized by the Suez Canal"; but charity itself would be at a loss to condone the statement that the circumnavigators of Necho brought back to Egypt "the startling account that they had seen the sun rise at their left hand" (p. 188)—a phenomenon which was presumably familiar to every Egyptian who chanced to look southwards at sunrise. To make amends for this, however, Dr. Birch on the same page "startles" us by telling us that "Necho was the last Egyptian monarch who had relations with the Jews," and then two pages later (p. 190) informing us, under the reign of Necho's grandson, Apries, that the Jewish king "Zedekiah made an alliance with the Pharaoh, and Apries marched against the Babylonians, who retired at his approach."

It is hardly worth while to multiply instances of similar carelessness; but even less comprehensible is Dr. Birch's indifference to the subject of chronology. To the general student, the duration of the Egyptian civilization is perhaps the most interesting problem in its history, and any book on the empire of the Pharaohs is fatally defective which omits to give all authentic material shedding light on the disputed question whether the Egyptian dynasties can be traced back to more than 5000 years B.C., as computed by many competent authorities, or whether, as Bunsen asserts, the limit must be placed at about 3600 B.C., or whether an even shorter period must be assigned to them. Dr. Birch evidently is disposed to restrict their duration to narrow limits, for the title-page claims as the scope of his book the history of Egypt "from the earliest times to B.C. 300," while the heading of his first chapter states its subject to be "from about 3000 B.C. to 2000 B.C." Yet he does not say a word to explain his assigning to Menes this date of 3000 B.C., nor does he condescend to give his reasons for practically discrediting Manetho. In fact, the most attentive study of his pages fails to afford materials for constructing an Egyptian chronology. Sometimes the duration of a dynasty is stated, but more frequently it is omitted, without a word to indicate whether this arises from pure caprice or carelessness, or whether there is valid reason for the omission. It is the same with the several reigns, the duration of which is frequently not stated, and that this is not caused in all cases by absence of facts is shown on p. 189, where, under Necho II., a stela at the Serapeum is quoted as fixing "the duration

* 'Ancient History from the Monuments. Egypt from the Earliest Times to B.C. 300. By S. Birch, LL.D., etc." 1 vol. 12mo. New York: Scribner, Armstrong & Co. 1875.

of the reigns of his immediate predecessor and successor," Psammetichus I. and II., though that of the former is not mentioned. Enough figures, however, are scattered through the volume to exceed the limit of 3000 B.C. assigned as the approximate date of the foundation of the monarchy.

It is not likely, however, that many students will puzzle themselves over the enigmas so provokingly set forth by Dr. Birch, for the volume is so lacking in all attractiveness of style and all sense of historic proportion, that few will, probably, be found to persevere to the end of even its very moderate number of pages. Parts of it are encumbered with a profusion of unnecessary and unimportant details, presented in the dryest manner; while other portions are meagre to absolute baldness. Archæological discussions are thrust into the midst of historical narrations, as though the contents of the author's note-books had been emptied out and thrown roughly together in chronological order, without a thought of classification or arrangement; and the whole is written in a style of singular clumsiness. In fact, it is impossible to avoid the belief that such frequent confusion of expression betrays confusion of thought. What, for instance, is the idea sought to be conveyed by this: "According to the Greek accounts, the twenty tributaries of kings reduced to twelve in number formed a dodekarchy" (page 182)? Or this: "Two obelisks of black granite in the British Museum, formerly founded at Cairo, show the admirable finish which prevailed at this period" (page 201)? As obelisks cannot be said to be "founded," we are reduced to the conclusion that the British Museum was "founded" at Cairo. Or this: "Another account of the same plan places it in the mythical ages of the followers of the god Horus, a parchment or leather roll of that date having been found in a brick wall of the southern temple, built by King Pepi or Phiops of the sixth dynasty" (page 38)?—where there is nothing in the context to relieve the evident absurdity of attributing an existing "parchment or leather roll" to "mythical ages."

Were this work the production of a mere bookseller's hack we would not weary our readers by even this brief exposition of its shortcomings, but its author's well-earned reputation gives it importance, and we can only regret that so useful a design should have been executed in so imperfect a manner by a man who on every page shows a familiarity with his subject which ought to have rendered the volume one of the highest value. It is not only a disappointment in itself, but its existence is an evil, in possibly preventing some better attempt to supply an acknowledged want, and in diverting, for a time at least, Dr. Birch's attention from the original researches in which he is so competent to extend the limits of positive historical knowledge.

## THE TABERNACLE OF THE HEBREWS.*

MANY pious and otherwise well-informed and clear-headed people entertain the idea that the mere reading of the Pentateuch would be sufficient to produce clear and adequate knowledge of the tabernacle of the Israelites, the sacrifices offered therein, the attendant priesthood, etc., etc. The contrary, however, is true, and the superficial reader is in danger of filling his mind with conceptions totally erroneous if he cannot, over and above his Bible reading, call to his aid some auxiliary branches of learning, such as, for instance, those parts of history, archæology, and linguistics which shed light upon Hebrew antiquity. In the work before us, or rather in the first part of it, the author has given a lucid and complete exposition of the construction of the tabernacle as erected by Moses in the Arabian wilderness, of its sacred furniture and other appurtenances, and of whatever else related to the sanctuary. Mr. Atwater has shown that he is able to treat a subject systematically and to write on it clearly. To any one desirous of becoming familiar with the Bible view of the tabernacle and the things connected with it, Mr. Atwater's exposition can be recommended. His standpoint is, of course, the so-called orthodox one. Whatever is contained in the Bible, from the first verse in Genesis to the last in Revelations, is assumed to be literally true. So firmly does he stand on this basis that he does not even think of refuting critics like Bohlen, Vatke, Colenso, and others who have tried to prove that the Book of Exodus was of a very late origin, and that the tabernacle described in it had never any historical existence. Consequently, Mr. Atwater accepts all the laws of the Pentateuch as of Mosaic origin (p. 115); considers Psalm cxxxii. as having been written by King David (p. 109); understands the Ebed Jehovah, so often mentioned in the last twenty-seven chapters of Isaiah, to be the Messiah, and chapter liii. of the same book to be a prediction that the Messiah will die as an expiatory sacrifice (p. 422); states that a pattern of the tabernacle to be built was shown by God to Moses while he spent forty days on Mount Sinai, and that then and there he received from the Lord minute specifications regarding the construction of the tabernacle and all its component parts, and full explanations of all its symbols and meanings (pp. 3, 9, 135), etc. We only state a fact when we assert that our author cannot reasonably expect a general assent to such views. How it was possible for him, resting upon the letter of the Scriptures alone, to suppose the cherubim as conceived by Ezekiel to be identical with the conception of the cherubim in the Mosaic tabernacle (p. 19) we do not know. There can be no doubt that the idea of the cherubim was an indefinite one, and that we have no right to confound the guardians at the gate of the lost paradise and the golden images upon the ark of the covenant and the supporters and carriers of the chariot-throne of Jehovah as seen by Ezekiel in his prophetic vision. The prototypes of the Hebrew cherubim—the Assyrian ki-ru-bu—had also no certain crystallized form and shape, as has been recently shown by Schrader, Lenormant, and other Assyriologists. They varied much in their appearance, and the numerous copies lately excavated differ considerably one from another.

In the second part of his work, Mr. Atwater has undertaken to explain the symbolism of the Hebrew tabernacle and of the Mosaic *culte*. Here the commentators and interpreters stand on more slippery ground. There is, first of all, a class who, like Winer, are inclined to the opinion that the tabernacle was only a copy of the usual Oriental tents, and who deny that it had any symbolical significance at all. Others, like the learned and ingenious Bähr, have found in this tabernacle, in its appurtenances, in the whole *culte*, inexhaustible materials for the most fertile reflections and for an insight into the attributes of the Divine King and his relations to the chosen people. To the latter class Mr. Atwater belongs, justly siding with those who ascribe a symbolical meaning to the tabernacle. That, moreover, a Christian theologian of orthodox tendencies should insist on a symbolical interpretation is quite natural. For the New Testament not only warrants such symbolical explanations of the tabernacle, of the sacrifices, the priesthood, etc., but it clearly teaches that the outward institutions of Mosaism were symbols conveying to the eye of sense higher ideas of a transcendental nature. While, in general, the New Testament, Philo, Josephus, the Talmud, the Midrash, the mediæval rabbis, and many eminent minds amongst modern Christian commentators, agree in this, that the Mosaic *culte* was of a symbolical nature, they disagree most decidedly in the explanation of the details. Thus, for example, Philo and Josephus start from the supposition that the tabernacle was a microcosm, a counterpart of the macrocosm, of the infinite universe; and this supposition we meet again in the commentaries of some later rabbis, who designated the tabernacle as an *olam katon*. Some doctors of the Talmud, the Kabbalists, Nachmanides, Moses Isserles, interpret the tabernacle as an imitation of a similar structure in heaven. The rationalizing Maimonides sees in it a palace erected to the glorification of the King of Kings, and, starting from this hypothesis, he explains the single parts accordingly. It is obvious that in such exegetical guesswork, where an exuberant fancy may play an important part, artificial and far-fetched results, and sometimes even ridiculous conclusions, may be reached. Or is it not altogether fanciful when, in the chapter treating on the significance of Biblical numbers, Mr. Atwater says (p. 190) that the three days spent by the Israelites in waiting before God revealed himself from Mount Sinai, were a reminder, in the number of days thus spent, that the Being whom they expected was infinite and divine?

Our author, however, is not satisfied with the symbolical explanations. He says that, besides its symbolism, the tabernacle had a typical or prophetical nature, a designed reference to Christ and Christianity, and he adduces passages from the New Testament in corroboration of this view. If, *à priori*, anything in the Old Testament having any real or supposed resemblance to something in the New Dispensation is taken as a "type," as a "shadow of things to come," then we leave the field of sober exegetical science and betake ourselves to the realms of—homiletics. A preacher may give such fanciful typical explanations, but not an historian or a commentator. For the work of a preacher is not exegesis, or history, or archæology. With him his Scriptural text is but a peg on which to hang, more or less loosely, his dogmatical or ethical teachings. The Biblical scholar, however, has nothing to do with any preconceived systematized theology. In his investigations he has to apply the same rules and to follow the same method as any other historian. It may be argued that the New Testament justifies and demands the typical or prophetical explanation of "types" found in the Old Testament. In answer to this, it is sufficient to point to the large number of learned orthodox divines who consider the New Testament passages in which matters and things in the Old Testament are applied to New Testament doctrines and ideas as homiletical applications, and not as finally and authoritatively settling the original meaning. And it is now generally conceded that the orthodox soundness of no Christian

* 'History and Significance of the Sacred Tabernacle of the Hebrews. By Edward E. Atwater.' New York: Dodd & Mead. 1875.

scholar can be questioned on the sole ground that he believes such passages to contain but the *Midrashim*, or the spoken or written sermons of St. Paul and other New Testament authors.

*Memoir of the Life of Josiah Quincy, Junior, of Massachusetts:* 1744-1775. By his Son, Josiah Quincy. Second edition. (Boston: Press of John Wilson & Son.)—We are glad to see a second edition of this agreeable memoir of a man whom only an early death prevented from occupying a high place among the eminent patriots of the Revolutionary period. As it was, his short life permitted him to give abundant proof of his ability and courage, not merely that kind of bravery which consists of pugnacious resistance to oppression, but also the kind which, the world over, gains the most lasting praise, and at the same time earns the most immediate hostility. Mr. Quincy was one of the counsel who, in the tumultuous days after the Boston "massacre," had the courage and professional sense of duty to undertake the defence of Captain Preston and his soldiers. This seems now, undoubtedly, the necessary act of a high-minded man, but, in the excited state of popular feeling then existing, it had to the mob the appearance of a desertion, by one of the American leaders, of the common cause. When we read the letter of Mr. Quincy's father, printed in this volume, in which he prays that the story just come to his ears of his son's defection may not be true, and notice the agonized expressions with which he dwells upon an act which we regard as equally to his son's credit, we cannot help getting a vivid idea of the dangers that surrounded him in the path of professional duty. Mr. Quincy's life, after it became known that he had undertaken the defence of the British soldiers, was not at all safe, though he was notoriously one of the most ardent lovers of liberty in Massachusetts.

From the time of this trial to the year of his death and the outburst of the war, Mr. Quincy was occupied with an increasing practice, and soon also with the care of his health, which gave early signs of decay. He was active in forming the plan of a continental correspondence, and his trip through the colonies, of which his journal preserves some interesting memoranda, was in great measure devoted to this object. A few months before his death he went to England, where he did much to reassure the friends of America in and out of Parliament, and obtained political information of a valuable nature, which was sent home to his wife under an assumed name. The account of his English visit, and the impressions made upon his mind by the corruptions of the times, are instructive and entertaining, and his *naïf* remarks upon what he hears and sees bring out very strongly the difference in morality and political honesty then existing between the governing class in England and the corresponding class here. Evidently, any one who went over to England at that time expecting to find in the Englishmen concerned in the administration a set of bloodthirsty tyrants, deaf to the voice of self-interest, who were bent on reducing the colonies to the condition of Asiatic satrapies, were apt to find that they had been much mistaken; that the "administration" was composed of a number of agreeable, gentlemanly men, who talked pleasantly, admitted that there had been much misrepresentation and misunderstanding, and were very glad to ask an intelligent American to dinner, but who, of course, must keep their places by supporting a certain policy, and who found that money was generally the easiest means of doing it. The prevailing atmosphere of corruption strikes Mr. Quincy very forcibly, and he gives a good illustration of the state of affairs by the story of an after-dinner remark to him of an English gentleman, who says in his ear confidentially, "My dear sir, rely upon it, if you are corruptible they will corrupt you."

Had he lived, Mr. Quincy would unquestionably have been one of the first lawyers and politicians of his time. His oratory, from the accounts left of it, must have been persuasive. It is difficult now, accustomed as we are to a more Saxon English, to enter fully into the spirit of the rhetoric of a hundred years ago, when the language in common use among men of talent was so much more Latin than it is now. His antiquated style, in which "speech" becomes "oration," "father" "parent," "freedom" "liberty," and so on, has perhaps a somewhat irritating effect upon our ears, and produces every now and then the impression that language must have been looked upon by our grandfathers not so much as a vehicle for the expression of thought as a kind of decorative art. It is an unjust impression, however, for they used merely the tongue in which they were brought up, as we do.

By a curious fate, Mr. Quincy did not live to see even the opening scenes of the conflict which he did so much to bring about, though on the occasion of the Boston "Tea Party" he was able, with the prophetic voice of a dying man, to foretell to the crowd gathered about the Old South Church the coming events. He died at sea in April, 1775, within sight of land, a few days after the skirmishes at Lexington and Concord had given the signal for the Revolution to begin.

*Speeches Delivered in the Congress of the United States.* By Josiah Quincy. 1805-1813. Edited by his Son, Edmund Quincy. (Boston: Little, Brown & Co.)—These speeches recall the style of oratory of the time at which they were delivered, and they have little in common with the approved Congressional oratory of the present day; but the manner seems much less remote from us than the matter of them, and they may still be studied with profit as models of forensic delivery. The argument is solid and logical; there is no buncombe, no triviality, no nonsense; the rhetorical ornaments are few; and the dignity and self-restraint of the speaker are manifest on every occasion where there is a temptation to forget them. Frankness, sincerity, and forcibleness characterize every one of the fourteen speeches embraced in this volume. Mr. Quincy spoke with the confidence of a real representative, who feels the community at his back not as urging him on, but as sustaining him at every point, and with the courage of a man of breeding—"a man whose ancestors have been planted in this country now for almost two centuries;" . . . "who has a family, and friends, and character, and children, and a deep stake in the soil;" . . . "who is self-conscicus of being rooted in that soil as deeply and as exclusively as the oak which shoots among its rocks." Many of the speeches here preserved have a present as well as an historical interest, as, for example, the one on the influence of place and patronage. That on the invasion of Canada (Jan. 5, 1813) has many applications to our recent politics. Mr. Quincy tells of certain Pennsylvanian Germans who "are taught to believe by their political leaders, and do at this moment consider, the allegation that war is at present existing between the United States and Great Britain to be a 'federal falsehood'"; just as certain Republicans nowadays are instructed and do believe that the allegation that the Southern States are at peace with the Union is a "rebel falsehood." People then "did not understand that an invasion of Canada was to be, in truth, only a mode of carrying on an electioneering campaign"; nor do they now fully comprehend that the domestic invasions contrived for the manufacture of Southern "outrages" were only another mode of controlling the elections—by intimidation where votes were lacking. It was in this same speech that Mr. Quincy conjured up a phantom which even then, eighteen years before Nat. Turner was heard of, it required great boldness to allude to except with bated breath, by remarking that it appeared absolutely impossible "that bounty should be offered, and proclamations issued, inviting the subjects of a foreign power to treason and rebellion, under the influences of a quarter of the country upon which a retort of the same nature was so obvious, so easy, and in its consequences so awful." But Mr. Quincy knew no fear in such matters, and in his speech on Louisiana as a State (January 14, 1811) did not hesitate to express his conviction that the proposed step was a virtual dissolution of the Union, and would be so regarded by his constituents. His prophecy of evil has been justified, but in a different manner from that in which he foresaw it. The Constitution, he said, "was never constructed to form a covering for the inhabitants of the Missouri and the Red River country; and whenever it is attempted to be stretched over them it will rend asunder." Disruption would ensue as a consequence of "changing all the proportions of the weight and influence possessed by the potent sovereignties composing this Union." Mr. Quincy dreaded transgressing the natural boundary of the Mississippi and the introduction of "strangers" to an equal share in the original partnership. Eleven years later, President Monroe prepared a message for Congress containing "a strong argument against making any territorial settlement on the Pacific, with a decided expression of opinion that they would soon separate from this Union." His cabinet objecting, the message was never sent. Calhoun and J. Q. Adams, as the latter tells us, both agreed in thinking that a separation would not take place. Adams "thought a government by federation would be found practicable upon a territory as extensive as this continent, and that the tendency of our popular sentiment was increasingly towards union."

This volume is a valuable contribution to the history of a period which, as the editor remarks in his preface, "is too remote for the memory of the mass of living men, and not remote enough to tempt the hand of the philosophic historian." Each speech is prefaced by a brief note conveying all the necessary information in regard to the circumstances under which it was delivered.

*The French at Home.* By Albert Rhodes. (New York: Dodd & Mead. 1875.)—Mr. Rhodes knows his subject evidently to such depth as he pre-

tends to fathom it, and he has written an amusing, though an extremely light, little volume. The American demand for information about Parisian manners and customs seems to amount to what is commercially called a "steady run," and it might be less intelligently supplied than in these pages. The author's observations of external characteristics is very lively and persistent, and if he is not very strong as a reasoner, he is an excellent taker of notes. He does not pretend to moralize, but simply to report definite facts, and the merit of his book is in containing a great many of these, of a minute kind. His picture is a friendly one, and we have no disposition to quarrel with it. Moreover, his attitude is the right one, in that he accompanies his generalizations, such as they are, with a number of examples and anecdotes. In some points, however, Mr. Rhodes is open to criticism. That he is writing to explain and elucidate French matters to an ignorant public (as the rudimentary character of much of his information implies) is a reason against and not in favor of his incorporating uninterpreted French phrases into his style. In this way he constantly puts the cart before the horse. "The country of the Tender" is impossible English, besides being an inexact translation. The French phrase is the "pays de Tendre"—not "*du* Tendre." The "garments that are left out of the hands of the aunt" is an awkward form for a first allusion to the pawnbroker; the "addition" for the "bill" is a needless Gallicism; and to speak of "walls of that bluish-gray *affectioned* by painters" is very bad indeed. Is not Mr. Rhodes also rather lax sometimes in his economic statements?—as when he says that "twenty-five thousand [francs a year] for a bachelor" will yield "an apartment in the Boulevard Malesherbes, *au second*, with a cook and a man-servant, a horse and coupé, a box at the French Opera, breakfasts at home, and dinners at the Imperial or Jockey Club; the dwelling consisting of five rooms, with objects of art, one or two of some value." We rather think that the bachelor in question would have to be a thrifty fellow to extract these multifarious luxuries, in the current year, from the income mentioned by Mr. Rhodes, ample though it seems. His programme has an anachronistic sound; it reads like a tender memory of the golden age of Louis Philippe. We must add that the publishers of the present volume have disfigured it with "numerous illustrations" which have been transferred without acknowledgment from certain French publications of thirty years since, and have neither merit nor suitableness. We have an impression, indeed, that some of them (or some of the series to which several of the cuts belong) have already figured as stolen goods in an American book published twenty years ago and written by Mr. J. J. Jarves, entitled 'Parisian Sights and French Principles.' This little book, by the way, had in some degree anticipated Mr. Rhodes—how effectively, our memory does not serve us sufficiently to say.

## BOOKS OF THE WEEK.

ESTES & LAURIAT,
Old No. 143 Washington Street, New No. 301, Opposite Old South, Boston.

RIME
OF THE
Ancient Mariner.
BY S. T. COLERIDGE.
WITH TWENTY ILLUSTRATIONS, 5½ x 7,
BY J. NOEL PATON, R.S.A.

Printed on heavy toned paper, with large margin, elegantly bound in cloth.

PRICE $2 50.

KILBOURNE TOMPKINS,
16 Cedar Street, New York.

PRINTERS' Cabinet, Type, Press, and Boxwood Depot; Eagle Cabinets; Pattern Letters for Machinists. —VANDERBURGH, WELLS & CO., cor. Fulton and Dutch Sts., New York. N. B.—Engraving—Electrotyping.

ALBERT MASON,
3 ASTOR PLACE,
Publishes a volume of Essays, entitled
A Free Lance in the Field of Life and Letters.

1 vol. 12mo, $1 50. By Prof. W. C. WILKINSON.

Of this book, the *Westminster Review* for April, 1875, says:

"It is not a frequent pleasure to meet with English essay-writing so fresh, forceful, and terse as Mr. Wilkinson's; and especially rare is it to receive from the other side of the Atlantic writing so good, and evaluation of English authors so sympathetic and appreciative as Geo. Eliot finds in this volume Three papers on Mr. Lowell may prove not only interesting, but useful to a public which is apt to connect Mr. Lowell, as the University of Oxford did when it presented him with an honorary degree, principally with the 'Biglow Papers.' Mr. Wilkinson exhibits him as a poet of great originality and beauty, while he highly disapproves of him as a critic. Mr. Bryant's blank-verse is little known in England, but Mr. Wilkinson's praise of it may go far to introduce it more widely. His translation of the Iliad is pronounced to be 'by eminence the Iliad of the English-speaking nations.'"

PROF. L. SAUVEUR'S NEW PUBLICATIONS.

Introduction to the Teaching of Living Languages. 50 cts.
Causeries avec mes Elèves. $2.
Petites Causeries. $1 50.
Causeries avec les Enfants. $1 50.
Entretiens sur la Grammaire (en préparation).

MANUAL OF INTRODUCTORY Chemical Practice. By Professors Caldwell and Breneman of Cornell University. Ready in August. For sample sheet, etc., apply now to FINCH & APGAR, Ithaca, N. Y.

W. P. NIMMO'S BOOKS.

Messrs. Cassell, Petter & Galpin announce with great pleasure that they are appointed sole Agents in the United States for the above important Catalogue of Publications.

Mr. Nimmo's Standard Series and Poets have so long been noted as the cheapest and best books ever issued that it is not necessary to say more than to intimate that stock and catalogues are to be had from Cassell & Co., 596 Broadway, New York. Our own new catalogue will be ready shortly. Application for copies requested.

TREASURE TROVE. Cloth, 278 pp. An Illustrated Poem. Price $2 25. Sent free on receipt of price. E. L. FREEMAN & CO., Publishers, Central Falls, R. I.

ADVERTISERS who desire to reach country readers can do so in the best and cheapest manner by using one or more sections of Kellogg's Great Newspaper Lists. Apply to A. N. KELLOGG, 79 Jackson Street, Chicago.

The Law of Literature,
REVIEWING
The Laws of Literary Property; Books, Lectures, Dramatic and Musical Compositions; Works of Art, Newspapers, Periodicals, etc.; Copyright Transfers, Copyright and Piracy; Libel and Contempt of Court by Literary Matter, etc.
By JAMES APPLETON MORGAN, M.A.,
Of the New York Bar.
In 2 vols. 8vo, law sheep, $15; cloth, $12.

JAMES COCKCROFT & CO.,
NEW YORK.

F. W. CHRISTERN,
FOREIGN BOOKSELLER AND IMPORTER,
77 UNIVERSITY PLACE, NEW YORK.
Large assortments of the publications of Charpentier, Didier, Didot, Hachette, Lévy Frères, etc., on hand; also complete lists of Tauchnitz's Collection of British Authors, and Teuner's Greek and Roman Classics. All European periodicals received weekly in parcels.

BOOKBUYERS will find their orders executed with intelligence and promptness by GEO. E. STEVENS & CO., Booksellers, Cincinnati, O. Letters of enquiry as to prices, etc., are invited. Any books will be carefully forwarded on receipt of their advertised price.

David G. Francis,
DEALER IN NEW AND OLD BOOKS,
17 ASTOR PLACE AND 140 EIGHTH STREET,
NEW YORK.
Priced Catalogues issued from time to time and sent to any address. Foreign Books imported to order promptly.

BOOKS AT LONDON PRICES.
Now Ready: Catalogue No. 6 of Rare, Valuable, and Curious Books, free on application.
JOHN EVANS, Importer, 318 Hudson Ave., Brooklyn, N.Y.

SOME IMPORTANT FRENCH *text-books, with a conspicuously-complete Dictionary, published by Macmillan & Co., are noticed by "The Reader" on page* vi.

# The Nation.

*NEW YORK, THURSDAY, AUGUST 12, 1875.*

## The Week.

SENATOR MORTON was, in 1866, in favor of the payment of the bonds in greenbacks. Within two or three years, having found out how the cat jumped, he turned right about, and denounced savagely anybody who proposed to pay the bonds in paper. Last year he was in the Senate the most ardent advocate of inflation. He ridiculed specie payments as a chimæra; declared that the "people wanted more money," and ought to have it; cited the example of Austria and Italy as proof that nations prosper most where their money is irredeemable paper; and inveighed against the advocates of resumption as "book men" and "theorists." In fact, he poured forth folly and ignorance like a spring flood, and helped to fill the business men of the country and its foreign creditors with alarm. On Saturday last he made a speech at Urbana, Ohio, in which he appeared as a hard-money man and opposed to inflation; he showed, as has been so often shown before, that paper "based on the entire wealth of the nation" was a humbug and delusion, because what was the use of "basing" it on the wealth of the nation if the wealth of the nation could not be used to redeem it? He acknowledged that the time had gone by, if there ever was a time, when inflation could do any good, and that the panic must now be allowed to run its course "until the times are relieved by economy, industry, and the operation of general causes." And he maintained that we must now get back to specie payments steadily and gradually. All this may be creditable, but can only be considered creditable at the expense of the Senator's judgment. That is, if he is honest, we are forced to set him down as ignorant and foolish. The Republican papers which are now glad of his help in Ohio are of course ready to overlook his financial somersaults, and he will slip back into contraction and hard-money without exciting much attention; but his performance is worth the notice of political philosophers as an illustration of the way in which a thoroughly unprincipled politician keeps afloat and in office from year to year, without much discomfort or inconvenience.

---

Senator Morton's account of the real issues raised in the Ohio campaign is, we need hardly say, that they relate wholly to the condition of the South, where the rebels are still rampant and unrepentant and the colored people unprotected; and he declares that what the Democrats are really after is the acknowledgment of Confederate war-claims, the payment of compensation for the slaves, and the disfranchisement of the negroes, and he reiterates in the fullest manner his belief in the "outrages" of the canvass of last fall, and denounces those who considered them untrue. In fact, he makes the insecurity of the Southern negro again the main reason for the continuance of the Republican party in power. It ought to be said that since Mr. Pierrepont assumed the Attorney-Generalship accounts of "outrages" have entirely ceased to come in from the South—an extraordinary circumstance, to which Mr. Dawes pays too little attention. As the slaughter of the colored man is going on steadily, by what infernal device are the reports of it prevented from reaching Washington?

---

The Governor's Canal Commission has made its first report, giving the history of what is known as the Denison Contract. Mr. Denison contracted with the State in 1869 to do some work on the Erie Canal for the sum of $74,183 40. In May, 1875, he had succeeded in doing two-thirds of the work, and in drawing from the Treasury the sum of $417,571. It is needless to say that the work is badly done, and in part worthless, or that Mr. Denison has swindled the State out of a very large sum of money, which must be recovered, if at all, through the courts. There is another side of the question which is far more important, however, and that is the account given by the Commission of the means by which Mr. Denison was enabled to enrich himself. They find, first, that the contract was let without any preliminary survey, map, or estimates, required by law; second, that the Division Engineer never made any such drawing, map, or estimates, required by law; that the State Engineer and Surveyor never approved them, as required by law; that O. Bascom and John D. Fay, Canal Commissioners, falsely certified that they had examined and approved this survey, etc., which was not in existence at all; that the Contracting Board directed that these non-existent maps, plans, and estimates be adopted and advertised for letting, and that the contract was then advertised. The Commission also find that this mode of letting contracts on false certificates was the regularly established practice. Now, of course, Mr. Denison is a bad man, and has committed frauds; but what is to be said of the management of its affairs here exhibited by the State of New York? The Commission say in so many words that all this fraud was "only possible through the culpable neglect or connivance of the Canal Commissioners, engineers, and inspectors in charge." There is no reason to believe that, on the whole, these officers will be any better in the future than in the past, so that the report amounts to a confession of the complete break-down of the whole system of canal management. It amounts to an almost mathematical demonstration that the checks and safeguards established to protect the State are themselves rotten, and the State cannot manage its own business. What practical way out of the difficulty there is except a sale of the canals for what they are worth, we cannot perceive.

---

A very unpleasant scene occurred at the Police Board in this city the other day, when General (Baldy) Smith addressed his colleagues. General Smith is an officer and a gentleman, who, when recently appointed by Mayor Wickham, found himself in somewhat strange company. The investigation now pending into the manners and morals of the force by the Committee of the Legislature has shown both of them to be in a very bad condition, we presume greatly to General Smith's disgust, who can do nothing to remedy it, as he forms a minority of one. He has accordingly since his appointment taken very little part in the proceedings of the Board, and has occupied himself with making observations and collecting facts illustrative of the state of the police. On Saturday last, thinking the time had come to speak out, he addressed his colleagues, offering several amendments to the rules and regulations, and complaining of the way in which previous recommendations of a similar character had been disregarded. He declared the force to be in a demoralized and disorganized condition, and to be growing worse every day. He also avowed his want of faith in the present Board, and his belief that there was a combination among the Commissioners to prevent any improvement, and gave as his authority for this statement Mr. Disbecker, one of his colleagues, and an appointee of Mayor Havemeyer, and accused this worthy of having offered him (General Smith) his vote for the presidency of the Board, for a higher price, however, than he was able to pay. Turning to old Mr. Matsell, the General then denounced him as having been "editor of the *Police Gazette*, a school for thieves," when he was appointed Superintendent, and declared that to have been "the best text-book for young villains he had ever read." Matsell at this turned red, and, after saying that he had dissolved his connection with the *Gazette* when he was appointed, finally muttered that he "was proud of his connection with it." There is little doubt that Matsell's "sentiments" are now "embittered." He "feels unkindly" towards General Smith. He thinks General Smith ought not to have "got excited." He looks upon General Smith's views of the *Police Gazette*

as monarchical, and wonders what he is after, and whether a thousand dollars would not "make it all right" with him.

Since the attack on the Commissioners by General Smith, there has been a terrible commotion in the Board, all the members of which have been interviewed, and explained their positions. Matsell was found quite ready to talk, and explained to the reporter who came to get his views, swearing meanwhile like a pirate, that Gen. Smith did not know what he was about. The *Police Gazette*, he said, while he had charge of it, was the terror of the criminal classes. They dreaded it more even than they did the police. This shows what a pity it was that Matsell did not go on publishing it as Commissioner. With the "finest police in the world" under him, and the *Police Gazette* as the official organ of the Board, the thieves and murderers would probably by this time have all left the city. The Commissioners have held a meeting, at which all concerned have made speeches, and Disbecker has managed to get up an "issue of veracity" between himself and General Smith; but the difficulty is that people generally trust General Smith, while they do not believe a word that Disbecker says.

The dead-lock which has now for some months prevailed in the government of this city seems to have come to an end through the removal of the Corporation Counsel, Mr. E. Delafield Smith, and the appointment of a Democrat, Mr. William C. Whitney, in his place. There can be no doubt that this is an improvement, and an indication that Mr. Wickham's intentions are good. It also seems to show that the slight coolness which had begun to make itself apparent between the Mayor and the Governor is not likely to "split the party." In fact, the citizens of New York now have for the first time in its history the satisfaction of knowing that their three great officers, the Governor, the Mayor, and the Boss, are all honest men, belonging to the same party, and working together solely for the public good. They are, to be sure, surrounded by bad men, but, unlike some other eminent reformers in similar difficulties, they appear to have got the better of their "wicked partners," and even go to the length of disciplining them. With Tammany Hall behind them, and their important patronage, they have power to give the city at least an opportunity of good government, for which they will be held to a strict accountability.

Nothing of a startling character has been developed in mercantile affairs during the week. There have been no suspensions directly caused by Duncan, Sherman & Co.'s failure, and it is becoming evident that there will be none. There was, however, on Monday a suspension (that of Archibald Baxter & Co.), caused by the derangement of the foreign-exchange market. In London, Alexander Collie, of the bankrupt firm of Collie & Co., has absconded, and thereby virtually admitted the charge of fraud which was made by the London and Westminster Bank. The markets for gold, merchandise, and securities have been feverish but not excited nor active, the disposition being general to await further developments as to the crops. The damage already done by the heavy rains can be no more than guessed at, and what the weather will be until the harvests are completed of course cannot be foreseen. Among business men the feeling, however, is that the autumn trade will be fully satisfactory, and already it has commenced, in some departments, in a way which justifies that opinion.

After the failure of Messrs. Duncan & Sherman, a very familiar phenomenon presented itself in Europe—that is, England and the Continent began to swarm with people who were short of money owing to this unlooked-for disaster. Most of them, of course, belonged to that class who are always short of money, whose "remittances" never arrive, and who are thereby placed in a most embarrassing position. Usually, they have to be very vague in their accounts of the cause of their misfortunes, so that when a well-known banker fails it is a perfect godsend to them, by enabling them to garnish their story with names and dates and circumstances. It is the wants of these unhappy persons which appear to have inspired the afflicting accounts of the distress of the American travellers in Europe who carried Messrs. Duncan & Sherman's credits, and especially that of the schoolmistress who, having only six dollars when the news reached her, started for home in the steerage, while her friends put about twenty-five dollars into a Cable message announcing that she was on her way. The real bearers of these credits have been relieved from their embarrassment by an advance of $250,000 to Messrs. J. S. Morgan & Co. to meet their claims by Mr. Alexander Duncan, the father of Mr. William Butler Duncan; but what will become of the poor fellows who hold no credits, and whom this failure enabled for a brief period to wear the robes of sudden and unforeseen misfortune? The charitable will now refer them to Messrs. J. S. Morgan & Co., but Messrs. J. S. Morgan & Co. will not heed them.

So much has been said of the great "coal monopoly" of the Reading Railroad, that its evils have come to be taken for granted as something not needing proof. At last, however, the Pennsylvania victims of this gigantic engine of fraud and extortion have demanded an investigation by the Legislature of the State, and have, in return, brought more facts to light than they bargained for. The Company attacked showed fight, and the President, Mr. Gowen, a man of remarkable ability, only begged that the investigation might be thorough. He took the investigating committee to the mines, and showed them the character and extent of the property and its importance, and then proved, first, that the price of coal had steadily been declining; second, that there was no combination in existence to keep it up; third, that the Reading road sold coal along its line at nearly, if not quite, the cost of its production, not from motives of philanthropy, but to build up business which would need transportation; that, besides this, the monopolists had made a vain effort to introduce co-operation among their employés, by offering to contribute money to be added to any savings of the men, the whole to form a fund by means of which each man might acquire an interest in the stock, but that the trades-unions had frightened the men out of it; that the monopolists had also a regular system of promotion, and always pensioned their retiring employés, or their families in case of death.

Having brought forward these facts as pretty good proof that the Company were not keeping the price of coal up, or grinding the face of the poor, Mr. Gowen took the offensive, and enquired where the attacks on the road came from, and showed pretty conclusively that the petitioners for the investigation did not represent consumers at all, but retailers, who were threatened with a loss of business because of the effect on prices exercised by the Company; that they sold at much higher prices than any one else; and that even as retailers they were entitled to no consideration, inasmuch as they cheated their customers by selling short weight; and he managed to produce the exact number of pounds which one or two of their tons contained, and which was four or five hundred pounds out of the way. There seems to be little in answer to all this from any quarter. The most curious part of Mr. Gowen's speech is that in which he shows how the monopolists themselves are oppressed by the labor-reformers and politicians. The Company is of course the great taxpayer of the region in which its mines lie, while it has no share in the government, which is carried on by the "citizens"; in other words, by the miners, led by the labor-reformers. When a strike occurs, the towns or counties immediately levy a tax, which is paid by the Company, and is then distributed among the men as "out-door relief." Another way is to vote large sums of money for keeping the roads in repair, the amount spent on one road being $2,725 per mile annually. Besides this extortion, the monopolists are every year or two threatened with some hostile legislation or other, and Mr. Gowen gives an exam-

ple of this in what was called the Labor Tribune Bill (it actually passed one reading in the House of Representatives), by which all the industrial works of Pennsylvania were to be managed by and to be subject to the control of a board called a tribune, composed of twelve men, of whom one was to be the secretary of internal affairs, one a coal operator, one a manufacturer, and the other nine laborers, and the decision of this tribunal upon any question of dispute was to be final, and, if it was not obeyed, the disobedient offender was to be imprisoned for seven years.

---

Brother Shearman was treated with great forbearance by the press during the late trial in Brooklyn, but he does not seem to have appreciated it. In spite of his prominence in the proceedings, little or no allusion was made to his unfortunate antecedents, and he might, if he had pleased, have gone to Europe for his holiday without note or comment. But he has grossly abused his privileges, for, instead of taking his vacation quietly, he has delivered a short discourse on the trial to a London congregation, in which he gave a slanderous account of the manners of American ministers towards the female members of their churches, and seems to have told a direct falsehood about Mr. Fullerton, of the counsel for the defence, in ascribing to that gentleman belief in Mr. Beecher's innocence, and alleging that he, for that reason, refused to address the jury, and confined himself to cross-examination. This makes it necessary to warn the English press and public against Brother Shearman as an untrustworthy person. Although a member of the New York bar, he is not a member of the Bar Association, and could not, we venture to assert, obtain admission to that body. Moreover, he first became known to the public about 1869 by acting not only as James Fisk's lawyer but as his confidential agent and attorney, occupying an office at the Opera-House, and devoting himself exclusively to the scoundrel's "business." He was, too, principally instrumental in obtaining the fraudulent and corrupt orders from Barnard for which that judge was subsequently driven from the bench, besides figuring largely in most reckless and shameful litigation of the Erie Ring. His income derived from this position during the two or three years in which he held it must have been very great. His appearance in the Brooklyn scandal as Mr. Beecher's friend, confidant, and counsellor, and as clerk of the church, was, as far as Brother Shearman himself was concerned, not surprising, for it promised some sort of resuscitation for his reputation; but that Mr. Beecher should have sought or permitted it, was regarded by most people outside the church as simply of a piece with the friendship with Tilton, and the still warmer friendship with Moulton. Both Mr. Beecher and the church will find out, however, before this affair is over, that character *is* of some consequence in this world, and that lachrymoseness (Brother Shearman seems to weep at will) is no substitute for it. We advise Dr. Parker and other Congregational ministers in England not to trust or encourage public statements from Brother Shearman, but pass him on quietly to the mountains, or the baths, or wherever he is going.

---

The escape from jail at Columbia of ex-Treasurer Niles G. Parker is said to have been taken resignedly by a community which he had already plundered to such an extent that they grudged the costs of jail maintenance and further prosecution. He seems, in fact, to have been almost invited to walk off by the liberty allowed him outside of his cell and the absence of the usual restraints on the visits of friends and relatives. His son was in the plot, but the accomplice who took the leading part, and who has since been arrested, was one Mattison, a United States revenue collector, who was out on parole after having been a year in prison on the charge of murdering a man whom he was seeking to arrest. He and a colored boy had horses in readiness for Parker as soon as the latter had reached the ground by means of the lightning-rod. Parker then rode to a place appointed, at which he found, as the story goes, "his $6,000 horse," once on whose back he doubtless felt himself beyond pursuit. He has, however, been recaptured and locked up again, even if we are not permitted to say secured. His flight, meantime, has served the useful purpose of a confession, and has given the moral climax to his career. If the State were only concerned with establishing his infamy, it could well afford to let him go—we had almost said Scott free. There is some hope, however, that his partners in robbery may be discovered through him. Of one thing South Carolina may be assured, that the exemplary punishment of this adventurer will not impair in the slightest her cordial relations with Massachusetts.

---

The O'Connell Centennial has been celebrated in all the principal cities of Great Britain and Ireland and America with great state. In Boston, it drew forth an oration from Wendell Phillips, and a speech from General Butler, in which Butler denounced the Puritans as bigots and vagrants; declared that before 1798 the Irish were a "happy, prosperous, and industrious people" of 8,000,000, but that after that period the oppression of the Government and of the landlords reduced them to 4,000,000, and mentioned that the Jacksons, Johnsons, and Polks, and other North-of-Ireland Presbyterians, had come to this country in search of religious liberty. He confessed that he looked forward "to the time when Ireland should govern New England, and New England govern the United States," and expressed a strong admiration of the Catholic Church and great horror of scepticism. For a "not very remote son of Ireland," which he declares himself to be, Butler's knowledge of Irish history is somewhat scanty and confused, but is quite sufficient for purposes of imposture. In Dublin, the procession was charged repeatedly, and thrown more or less into disorder, by a body of mounted coalheavers, who had a dispute of precedence with some other portion of it. The audience subsequently refused to hear the Lord Mayor read Lord O'Hagan's speech, which the latter was prevented from delivering himself by a domestic bereavement, on the ground that his lordship was too "Whiggish," and the banquet broke up in a row before the regular toasts were reached and the gas had to be turned off to prevent a general mêlée. "The boys" who took part in these tumultuous proceedings would probably answer unfriendly criticism of them in the words in which Wendell Phillips disposed of O'Connell's violence of language, that "stupor and palsy never understood life." There were to have been fireworks on the evening of the third day's celebration, but they were forbidden by mayoral proclamation, owing, it is said, to the receipt of confidential information from Cardinal Cullen that extensive arrangements had been made for a fight. The root of the trouble seems to lie in the hostility of the Fenian element to the "Home Rulers," and of the Home Rulers to Fenians and everybody else.

---

A judgment which, if confirmed in the court of last resort, will have considerable importance in Italian politics, has just been rendered by the Civil Tribunal at Mantua upon a disputed claim to an ecclesiastical benefice. Two communes in that province—San Giovanni del Dosso and Frassino—have refused to receive the parish priests assigned to them by the Archbishop, and have, at an open meeting in their piazzas, elected others by 207 votes to 47. One of them—he of San Giovanni del Dosso—had already got into possession of the temporalities, but he of Frassino had not. Under these circumstances, the Archbishop applied to the court of law to oust them, and produced his own authority under the canon law as proof of their want of qualification. The Court, however, after full argument, held that it knew nothing judicially of the canon law; that, as the Archbishop had not obtained the royal exequatur, it knew nothing of him either; and that, on general principles, the people of a parish cannot be denied the right of electing their own pastor. As the priest of San Giovanni is in possession of the living, he continues to hold it, having been appointed by the Archbishop some time before his election as a "stated supply"; but the new priest of Frassino, not having received a canonical appointment, the Minister of Worship refuses to deliver the temporalities of the parish to him, although the Court gives him possession of the parish church,

## THE O'CONNELL CENTENNIAL.

THE celebration of the hundredth anniversary of O'Connell's birthday by Irishmen in various parts of the world has naturally been enthusiastic. His fame is one which Time only enlarges and confirms. The memory of his defects of method, which were very numerous and striking, of course have passed away with the generation which witnessed them. What the present generation knows of him and remembers is, that he found the Irish Catholics in a condition of great political degradation, and that he emancipated them; and that he began the conflict against the most tremendous odds when he was still a young man, and had won the day before he was fifty, though in winning it he had to attack the most stolid and self-satisfied and imperious race in the world in their very dearest and most deeply-rooted prejudices, and to attack them too with nothing but his tongue. It was a great victory, there is no denying. Never yet in the history of peaceful agitation has one man done so much, for O'Connell was himself the Catholic movement. If he had been taken out of it after the first small meeting, there would have been nothing left of it, and Emancipation would have come rather from the slow development of the English conscience than in the nobler and better way, from the struggles of the Irish Catholics themselves.

But then Time does not do as much for his work as it does for his memory. Since his day, Ireland has played a considerable part in European politics; before his day, little or nothing was known of it beyond the fact that it was a discontented and powerless province of Great Britain. Cold criticism has, therefore, inevitably taken the place of respectful sympathy. From admiring the great thing which O'Connell did, people have taken to asking, What is the value of the new element which he has introduced into British politics; what has been the nature of its influence on the march of European and American affairs?—for its influence has been felt on this side of the water as well as on the other. Political and social progress, people remember sadly as well as joyfully, did not cease with the passage of the Emancipation Act by the British Parliament. There was still a world of work to be done on the Continent as well as in England before the cause of civil and religious liberty could be said to be fully triumphant. There were innumerable social problems to be solved, too, all of which needed all the care and judgment that Christendom could supply. The Irish Catholics appeared on the scene as speakers, writers, and legislators, just as the ideas which had been suppressed by nearly forty years of war and tumult were again beginning to find expression and to fill the world with a strange but not ungrateful impatience and foreboding. People, therefore, who are neither Irishmen nor Catholics say, when they are called on to clap hands because O'Connell was born one hundred years ago, something of this sort: "With the emancipated Irish Catholic we are very familiar. There are few parts of the world in which he is not now to be found; and wherever he is, he is apt to make his presence known. We are glad that Daniel O'Connell was successful in liberating him, because we are sure, from all we hear, that his condition before Emancipation was degrading. Emancipation was, therefore, very well as far as it went; but then it did not make the world perfect. A great deal had to be done after O'Connell's death, even for religious liberty; and before we begin our rejoicings over O'Connell's birthday, we should like, for the better regulation of our enthusiasm, to be informed what kind of part the school of politicians which O'Connell founded, and which received his maxims and traditions, has played in the work of political and religious progress. You must excuse us, but we have got over the idea we once had, that when you hear that a man is free you need ask no more about him. We have been taught by bitter experience that it is also necessary to ask what use he has made of his freedom. We must, therefore, enquire what sort of contributions Irish Catholics have made to the work in which we are all engaged, and how far their teachings have prepared or prompted them to become in all lands the friends of the causes which we, as liberal and progressive men, have most at heart, before we join you to the full extent in your rejoicings; and yet we do not deny that your hero was a great man."

Nor is this by any means an unreasonable view to take of O'Connell's responsibility. He could not have been expected suddenly to make the Irish Catholics austere and astute politicians of the Anglo-Saxon type. He could not change their history or their traditions or their temperament, nor could he probably have secured from them the support which he received in the earlier portion of his career had he been a man of finer fibre, or nicer taste, or more delicate conscience. He was rough, but he had rough work to do. He might have employed rhetorical weapons which would have had more weight in the House of Commons than the somewhat ruffianly invective in which he shone and habitually indulged, but then he spoke for Kerry and Sligo more than for Westminster, and he never could have made the hearts of his constituents throb with phrases which London drawing-rooms would have pardoned or admired. But then, when Emancipation was secured, and its triumph left him in possession of power which any monarch in Europe might have envied, and gave him the hearts of many millions as hearts have perhaps never before been given to a man, he deliberately and with set purpose proceeded to use it to strengthen and perpetuate the influence of the Catholic clergy over the masses whom he had brought on the stage of political life, and whose political prophet he was. There is no doubt he was himself a devout Catholic, and that when he beslavered the "venerated clergy" with his praises in Conciliation Hall, he felt all he said. He was doubtless conscientious in his endeavors to preserve their place for them in Irish politics, and to exalt it, and to give Irish politics ane eclesiastical hue, and make the Church a prime object of national concern, and to discourage purely secular ways of looking at things. But then his sincerity made his influence on the course of Irish political thought none the less hurtful. It preserved and stimulated that unfortunate tendency—which was natural and useful enough in the earlier stage of political development in which O'Connell found his Catholic countrymen, but which, when fairly admitted to the community of European nations, was a heavy burden and impediment—the tendency to act as a clan, through chiefs or tribunes like O'Connell himself, and to leave to them the work of thinking and deciding. It helped to perpetuate that separation of the Irish Catholics from their Protestant countrymen which has been to them the cause of unutterable woes, and has made their country a den in which the beasts of religious fanaticism, after being driven from every other civilized country in Europe, have found a refuge. It prevented them, too—which was also a great misfortune—from obtaining their legitimate weight and influence in either the British Parliament or any other deliberative assembly in which the leading political races in our day have a majority; for a party which has the priest behind it is now, in every parliament in the world, hated and distrusted and despised.

Though last, not least, it cut them off from political communion with the great Liberal party in all European countries, and has made them the bitter enemies of the movement which, in spite of many mistakes and drawbacks, has for fifty years made European politics a steady march towards a sounder and more enlightened polity—the movement which has given us a new Italy, a new Germany, a new Austria, and which, unless all signs fail, will give us, before long, a new France and a new Spain. Everywhere Irish Catholics have been found among its bitterest enemies, and it is characteristic and significant that the attempt to celebrate the hundredth anniversary of O'Connell's birthday in Dublin should have been a clerical affair with a strong Ultramontane tinge, and that the proceedings should have been marked by a succession of fights, and that the banquet should have ended in a riot which was only quelled by turning off the gas. We mention the fight and the riot not in jest, but in sober earnest, as illustrations of the points on which O'Connell's influence was defective. It was in no sense steadying; it did nothing towards the cultivation of a political sense or of a national public opinion. It did nothing for toleration, for mutual forbearance and the openness to conviction, for the regard for experience, which are the only sure foundations of modern states. It did nothing to bring Ireland into the

European commonwealth, or to bring Irishmen into true sympathy with the best tendencies of the time. The result is that Irish Catholics form everywhere a party to themselves, the wires of which are pulled more or less at Rome, and which circulates the Encyclical with more or less publicity as a serious political document; and which never sees politics as what it really is—not a picnic, or a jollification, or a high mass, but a piece of business as dry and laborious as book-keeping and as solemn and momentous as war. The Irishman who will deliver his countrymen from their subjection to the Church, and at the same time teach them the value in politics of sober-mindedness and the dangers of over-cultivation of the imagination, will do for them far more than O'Connell did; but such an Irishman has yet to show himself. The figures they cut in this country as the tools of demagogues like Butler and Banks, and the pleased and tickled protégés of musical rhetoricians like Mr. Phillips, are in fact melancholy illustrations of the smallness of the results which O'Connell accomplished.

## PROFITABLE AND UNPROFITABLE ECONOMY.

IN a time of great business depression like the present, the numerous suggestions as to the remedy which are made every day, are all entitled to a certain amount of respect, because they all contain a certain amount of truth. It is true, for instance, that too much of the floating capital of the country has been fixed in undertakings not immediately remunerative, and that, therefore, we ought for the present to avoid such undertakings. It is true that the habits bred by the war have tempted a great many people into living very expensively, and that in times like these they ought to reduce their style of living. It is true, also, that the experience we have had of the tampering of Congress with the currency since the panic, has probably aggravated the distrust with which the paper-money is regarded, and that this aggravation is very natural, and that, therefore, increased caution in business operations is desirable. But then, a large number of financial prophets and advisers are not content with these admissions. They insist upon it that what we need above all things is economy, and that the worse the outlook is, the more we must economize; that everybody must save as much as he can by cutting down all his expenses; and that after each failure he hears of he must cut them down still more. In fact, to listen to some of them, one would imagine that there could not be any recovery until we had "touched bottom," and that touching bottom meant general restriction to the bare necessaries of life.

Now, there is in a great deal of this talk the inconsequence which economists have often pointed out in the phrase a "general rise of values," which some people occasionally use, meaning thereby an increase in the value of everything together, including gold and silver. It needs but very little reflection to see that this is a chimera. But the notion that any process of recovery can take place through universal economy, or, in other words, universal diminution of consumption, accompanied by a universal increase of production, is also a chimera. If we all consume less, we cannot produce more, because the producers and consumers are the same persons. Therefore, the current newspaper advice on this subject needs considerable revision. If everybody reduces his expenses in every direction, he undoubtedly effects for the moment, say for a month or two, a considerable saving; but as soon as he attempts to increase his production he discovers that, if his neighbors have all been following his example, his market is gone. The position in which one now so frequently finds a newspaper prophet, urging his fellow-citizens to buy no new shirts this year, and at the same moment mourning over the slackness of work in the cotton-mills, is an obvious illustration of the fallaciousness of his theory. The fact is, universal economy as a means of recovery from a commercial crisis is an absurdity. Economy, to be effective, must be combined with steady or increased production; or, in other words, must be practised by only a portion of the community. If all classes undertake to practise it for any great length of time, the result will be somewhat like that of an attempt to lengthen a garment by cutting a piece off one end and sewing it on at the other. The elementary principles of political economy have been often illustrated by an account of the doings of a small company of shipwrecked artisans on a remote island. One, for instance, is a shoemaker, one a baker, one a tailor, and one a hunter, and they all exchange their products, and live happily. But it is easily seen that if, by way of remedying some imprudence or excess on the part of one of their number, all of them determine to consume as little as possible, their abstinence cannot possibly result in their all growing rich. Some have to consume freely to make the production of the others of any immediate benefit to them.

General or national economy may prove an effective means of increasing the national wealth, and of recovering from a crisis, if there is a good foreign market for the products of the national industry, but we have long proclaimed by our legislation our indifference to a foreign market, and have so arranged matters as to discourage foreigners from buying anything from us except for gold. The result is that when we fall into a slough like the one in which we find ourselves at this moment, and we all begin to "economize," there has to be a cessation or great diminution of production in all branches of manufacture. Our mills close or are on half-time, our furnaces are put out, our railroads carry freight below cost, and there is general stagnation, until a short harvest in Europe creates a foreign demand for our agricultural produce. It is undoubtedly this rather than our economy which is now going to set us on our legs again. Of course there has been what is called a "general liquidation," which some people talk of in a solemn manner, as if it were the means of making a solid addition to the wealth of the country. What they really mean by the term is a general settlement of insolvent debtors with their creditors, either by announcing that they cannot pay or by paying what they can. But then nobody is made any the richer by this process. The good it does lies in the fact that it frees some men from anxiety, and makes others acquainted with the exact state of their own affairs. It thus does much towards bringing about a return of prosperity, not by directly increasing the national substance, but by helping to restore confidence. And the restoration of confidence is after all the great thing we need; not more money, as some think, or low living, as others think. Periods of prosperity are not periods in which everybody is well off, but in which the belief that he is likely to be well off stimulates everybody's industrial activity. We are made busy and productive, not by being rich, but by expecting to be rich.

During the last six months the value of the exports of thirty-one leading American products from the port of New York has fallen off, even as compared with the same period in 1874, by over $27,000,000, or about fifteen per cent. During the same period our imports of coal, of manufacturing chemicals, of hemp, of dressed and undressed hides, of india-rubber, of molasses, of nearly all metals, of sugar, of tea, of rice, of saltpetre, and of fine woods, have also fallen off heavily—some of them enormously; in other words, there has been a great decline, as compared with last year, in the purchase of the raw materials of American industry. Some people maintain that this is a good, healthy state of things, and contains, in some mysterious manner, the seeds of recovery. Indeed, their argument, if pushed to its logical limits, would lead us to the conclusion that, through total idleness, and an absolute cessation of trade, provided they were accompanied with rigid asceticism, lay the true road to a revival of business. The truth is that the condition we are in is one of disease; the only satisfactory feature about it is that it is not hopeless or even dangerous, and that with time and care we shall be as well as ever again. But chuckling over the weakness of our limbs, the lowness of our pulse, and the shattered state of our nerves as gratifying symptoms, is not a rational performance. The state of stagnation which follows a panic in a commercial country is in reality a slight and temporary return towards barbarism. People

consume less and produce less for the same reason that they consume little and produce little in Mexico and Guatemala—that is, owing to a low sense of security about the future. Their state of mind about business becomes somewhat assimilated to that of the inhabitants of badly-governed countries in which the police are powerless or the courts venal. They want enterprise, and prefer living abstemiously to working hard or taking risks, just as the Costa-Ricans do. They cannot, however, get out of this state of mind by sitting still and saving in their clothes and food. The cure lies in the revival of confidence in the future, and this comes back, in the absence of fresh disasters, through the operation of time. When we say cheerfully that "business is reviving," that the mills are fully employed, that the furnaces have again been lighted, we simply mean that people have begun to take heart and create demand by buying again. The notion that this demand is the result of the accumulation of wealth during the previous bad year is a hallucination. The only good way in which the prevalent depression has really contributed to revival is by supplying cheap money to such manufacturers as use borrowed capital. With money at three or four per cent., the cost of production is of course lessened to those who can produce at all, and the consequent lowering of prices tempts unwilling purchasers into the market. But the depression which follows a crisis, being mainly moral, has to be dissipated in the main by moral remedies. Economy is a good thing if accompanied by industry and a good market, but not otherwise. In the one case, it is the virtue of an Anglo-Saxon; in the other, the vice of a Neapolitan.

## A JUDICIAL ELECTION.

IN May, 1870, an election was held which was probably as important as any which has occurred in the history of New York. In that month the people chose a new court of last resort, consisting of six judges and one chief judge, to declare for the next fourteen years finally and irrevocably the law of the State. The election, too, was important in another point of view, for in it for the first time the elective system was supplemented and perfected by the introduction of what is known as the "minority principle." This principle had been developed by European publicists for the purpose of remedying certain defects in representation, but its application to courts of law had not occurred to Hare or Mill, probably because they were unfamiliar with what we may call judicial politics. It was left to the thinkers of New York to invent a proportionally represented party bench, and it was to the hands of William M. Tweed that the execution of this scheme for the perfection of the elective system was entrusted. To that large class of patriotic Americans who, though debarred from all active participation in politics, still continue to take a speculative interest in the government of the country, it may be interesting to know what were the results. The real competition was between the four candidates of the minority—that is, the Republican candidates. An amendment to the constitution had provided that each party could vote for four candidates, but that the six having the highest number of votes should be elected. The four candidates of the majority could be chosen, and two of the four candidates of the minority. It had been settled in public opinion that the four Democratic candidates, Allen, Grover, Peckham, and Rapallo, as well as Chief-Judge Church, would be elected. The contest was between the four Republican candidates as to which two of them should have the largest number of votes.

The whole vote of the four Republican candidates in the State was:

| | Charles J. Folger. | Charles Andrews. | Charles Mason. | Robert S. Hale. |
|---|---|---|---|---|
| | 154,930 | 154,092 | 152,306 | 150,862 |
| In the City of New York | 26,406 | 23,635 | 22,246 | 22,034 |
| Outside of the City | 128,524 | 130,457 | 130,060 | 128,828 |

| | |
|---|---|
| Chief-Judge Henry R. Selden | 151,978 |
| In New York | 22,187 |
| Outside of the City | 129,791 |

By the vote of the city, Folger, from being the lowest of the Republican candidates, was made the highest. Andrews, from being 397 ahead of Mason, was made 1,786 ahead. It is to be noted that the whole five—the Chief-Judge and the four Judges—were voted for on one ballot. We will now see where and how Folger and Andrews were put ahead of their ticket.

The official returns show that in the Fourth Election District of the Eighth Ward the vote was as follows:

| | | | |
|---|---|---|---|
| Allen | 512 | Mason | 157 |
| Grover | 512 | Andrews | 157 |
| Peckham | 512 | Folger | 669 |
| Rapallo | 512 | Hale | 157 |

It will be seen that the regular Democratic vote in this district was 512 and the regular Republican vote 157, as appears also from the vote in the same district on the Chief-Judge:

| | |
|---|---|
| Church | 512 |
| Selden | 157 |

Notwithstanding this, we find that Folger received 669 votes, a number which happens, by a curious coincidence, to be the exact sum which would have been obtained if some inspector had added the regular Democratic vote to the regular Republican.

But we shall see as we go on that Judge Folger and Judge Andrews were popular men in New York in 1870. They had strong "personal magnetism," and though they were Republicans, the Democrats, even in the best-disciplined districts, could not be kept from voting for them. In the Second District of the same ward the regular Democratic vote was 942 and the regular Republican was 15, and the official record is as follows:

| | | | |
|---|---|---|---|
| Allen | 942 | Mason | 15 |
| Grover | 892 | Andrews | 65 |
| Peckham | 842 | Folger | 115 |
| Rapallo | 942 | Hale | 15 |

This is the first symptom of the incontestable unpopularity of Grover and Peckham, by reason of which fifty Democrats go over in a body to Andrews, and no less than one hundred to Folger. It may be thought strange, to be sure, that a Democrat, merely because he disliked Grover and Peckham, should insist on voting for Andrews and Folger, but it seems, from the vote of the Fifteenth District next following, that the sturdy Democrats took a secret pleasure in emphasizing their dislike for Grover and Peckham in this way:

| | | | |
|---|---|---|---|
| Allen | 1,003 | Mason | 19 |
| Grover | 503 | Andrews | 519 |
| Peckham | 503 | Folger | 519 |
| Rapallo | 1,003 | Hale | 19 |

Here we have no less than five hundred Democrats deserting the unpopular Grover and Peckham, and casting their votes solidly for the people's favorites, Folger and Andrews. A more emphatic rebuke than this has seldom been administered through the elective machinery. Curiously enough, however, the result tells, not against the Democrats, but in favor of Andrews and Folger, and against Mason and Hale. The upshot of this determined voting is that in these three districts of the Eighth Ward Folger and Andrews gain over Mason and Hale as follows: Folger, 1,112; Andrews, 550. It was noticed at the time that this ward in which the Andrews and Folger votes came out so strong was "Michael Norton's Ward"; but what this means we do not know.

The Sixth Ward also went against Peckham, but here the anti-Peckham Democrats were all Folger men, as the vote shows. In the Ninth District the vote was:

| | | | |
|---|---|---|---|
| Allen | 1,031 | Mason | 14 |
| Grover | 1,031 | Andrews | 14 |
| Peckham | 930 | Folger | 115 |
| Rapallo | 1,031 | Hale | 14 |

101 votes were transferred from Peckham to Folger. On Chief-Judge the vote was: Church, 1,031; Selden, 14. In the Tenth District Folger gets 300 votes at the expense of Peckham, and Folger's gain in the whole ward is 401 votes.

In the Seventh Ward the result shows that the voters were rather arithmetically than politically interested in the election, for beyond the usual interest in Andrews and Folger, their only object seems to have been to have each man on one side get exactly the same number of votes that his opponent did on the other. Whether there was any connection between the mathematically-balanced character of this return and the fact that this was Tweed's ward, we are unable to say. The vote in the Sixth District was as follows:

| | | | |
|---|---|---|---|
| Allen | 120 | Mason | 120 |
| Grover | 500 | Andrews | 500 |
| Peckham | 500 | Folger | 500 |
| Rapallo | 120 | Hale | 120 |

Andrews and Folger each gain 380 votes.

In the Tenth Ward, Grover and Peckham were not so unpopular with their own party as in other parts of the city; in two districts (the Fourth and Fifth) the votes were as follows:

| | | | |
|---|---|---|---|
| Allen | 251 | Mason | 111 |
| Grover | 376 | Andrews | 111 |
| Peckham | 376 | Folger | 236 |
| Rapallo | 376 | Hale | 111 |
| Allen | 276 | Mason | 131 |
| Grover | 392 | Andrews | 131 |
| Peckham | 392 | Folger | 247 |
| Rapallo | 392 | Hale | 131 |

Allen, it would appear, had not a satisfactory record in the Tenth Ward, for no less than 125 Democrats in a body deserted him in one district, and 116 in the other. An inspection of the vote shows that his votes were transferred to—we should say cast for—the indomitable Folger. In the remaining districts of this Ward, however, Peckham's unpopularity becomes painfully manifest. In the Eighth District the vote was :

| | | | |
|---|---|---|---|
| Allen | 260 | Mason | 103 |
| Grover | 260 | Andrews | 103 |
| Peckham | 192 | Folger | 171 |
| Rapallo | 160 | Hale | 103 |

From which it appears that no less than 68 of what we may almost call the anti-Peckhamites went up to the polls to swell the vote for Folger. Discipline told no better in the Tenth District, where 117 Democrats "went back" on their ticket, and sent Folger forging ahead :

| | | | |
|---|---|---|---|
| Allen | 324 | Mason | 75 |
| Grover | 324 | Andrews | 75 |
| Peckham | 207 | Folger | 192 |
| Rapallo | 324 | Hale | 75 |

In the Eleventh District the vote was :

| | | | |
|---|---|---|---|
| Allen | 619 | Mason | 198 |
| Grover | 619 | Andrews | 198 |
| Peckham | 619 | Folger | 373 |
| Rapallo | 619 | Hale | 198 |

showing the same extraordinary popularity of Folger that we noticed in the Fourth District of the Eighth Ward. There we had 512, and here we have 175 citizens coming from their workshops and their professions to record their approval of Folger, while caring so little for the other candidates that they do not cast even a single vote for any of them. Far otherwise was it in the Twelfth District, where the vote,

| | | | |
|---|---|---|---|
| Allen | 366 | Mason | 60 |
| Grover | 366 | Andrews | 60 |
| Peckham | 251 | Folger | 175 |
| Rapallo | 366 | Hale | 60 |

makes us wonder at the extraordinary sagacity of the Democratic party at large in managing not only to elect Folger, and to express their thorough disapproval of Peckham, but also to elect the latter at the same time. To transfer votes from your own candidate to an opponent, and elect the latter, is easy enough ; but to do this, and yet elect them both, has been, we believe, seldom attempted with success before. The fact that Folger's gains amount in this Ward to 716, shows how foolish is the popular delusion that the cities have any jealousy of rural candidates.

Turning now to the Twenty-first Ward, and omitting the Fourth and Sixth Districts as being less remarkable, we find in the Seventh District an awful example made of the wretched Peckham, who is absolutely abandoned in favor of Folger :

| | | | |
|---|---|---|---|
| Allen | 510 | Mason | 7 |
| Grover | 510 | Andrews | 7 |
| Peckham | ... | Folger | 517 |
| Rapallo | 510 | Hale | 7 |

The vote in the Tenth District was as follows :

| | | | |
|---|---|---|---|
| Allen | 642 | Mason | 19 |
| Grover | 19 | Andrews | 642 |
| Peckham | 19 | Folger | 642 |
| Rapallo | 642 | Hale | 19 |

Peckham and Grover lose here 623 votes, while Andrews and Folger, strange to say, gain exactly the same number. The sum of the gains of Andrews and Folger in this ward is as follows : Folger, 1,616 ; Andrews, 623.

Such were some of the returns of the judicial election of 1870, in which, for the first time, the elective principle was fully tested by the combination with it of the "minority" system. Now, it has occurred to some censorious investigators that the remarkable popularity of Folger and Andrews might be accounted for by supposing that their extraordinary gains were not the result of living and breathing and voting Democrats actually going over to them in the flesh, but that the inspectors, in counting up the returns, subtracted from the Democratic side what they added to these popular candidates' votes, and even in one or two cases added them on without subtracting from the other side; and they insist that these votes are false and fraudulent, and should be disregarded. They say that if this were done the result would be as follows :

| | Folger gains. | | Andrews. |
|---|---|---|---|
| 8th Ward | 1,112 | | 550 |
| 6th " | 401 | | ... |
| 7th " | 380 | | 380 |
| 10th " | 716 | | ... |
| 21st " | 1,616 | | 623 |
| | 4,225 | | 1,553 |
| Folger's false vote | 154,930 | Andrews's | 154,092 |
| True vote | 150,705 | | 152,539 |

We should then have, as opposed to the official canvass :

| | | | |
|---|---|---|---|
| True vote—Andrews | 152,539 | False vote—Folger | 154,930 |
| Mason | 152,306 | False vote—Andrews | 154,092 |
| Hale | 150,862 | Mason | 152,306 |
| True vote—Folger | 150,705 | Hale | 150,862 |

So that the popular Folger would not be a judge any more than William M. Tweed is a judge, while the popular Andrews would have only just got in by being 233 ahead of Mason, instead of 1,786. They say, too, that this fraudulent counting was the result of a bargain between the canal politicians in the interior of the State, who wanted Andrews and Folger elected, and Tweed. They say, too, that Folger ought to be got out by *quo warranto*, and that Andrews's extraordinarily large vote in the interior of the State should be accurately examined, to see whether this 233 ought not to be reduced, even perhaps to a minus quantity. But this is harsh and unkind, and tends to bring popular judicial elections and the minority system into contempt. What difference does it make if one or two judges were "counted in"? The rest were elected fairly. It is a pity to attract the attention of foreigners, who are sure to put the worst construction on everything American, to such matters as these, and the only effect will be to retard the revival of trade so confidently expected in the fall, and destroy the confidence of the people in the courts. If it is discussed, the next thing we shall hear is that there is corruption in some of the courts. We protest against it.

## ENGLISH AND SCOTCH EDUCATIONAL ENDOWMENTS.

London, July 17, 1875.

A BLIND orator, well known in England, tells with some humor an anecdote illustrating at once the advantage to him of his blindness and the resources of newspaper reporters. He had on one occasion, in his early political campaigns, made an animated speech before what he was led to believe was a numerous and enthusiastic audience, and, catching the enthusiasm of his hearers, he had surpassed himself, and was well satisfied with his appearance. At the end of the proceedings he entered into conversation with one of the reporters, who spoke feelingly of the audience. There were but seven persons present, including the reporter, but the orator was unaware of this, and naïvely asked the reporter if he considered that he had had a good attendance. To which the reporter replied : "Well, I should not describe it as a *numerous*, but as an *influential* audience." Mr. Grant Duff must have felt last Friday that he too was addressing an influential rather than a numerous audience when he called attention in the House of Commons to a report recently presented to the Queen by a Royal Commission appointed to enquire into the endowed institutions of Scotland. Scotch questions are never popular in the House of Commons, but they generally command the presence of a fairly representative assemblage of the Scotch members of Parliament. By bad luck, Mr. Grant Duff's discussion came on at the dinner-hour, and his able and interesting speech was listened to by the Speaker and eleven other members of the House, Mr. Grant Duff making up the round dozen. This, as it turned out, was exceptionally unfortunate, because the discussion, though carried on by mediocrities chiefly in the House, became one of some importance, as it branched off from being merely a Scotch debate into one in which questions of policy regarding the application of endowments were raised.

Educational endowments, both English and Scotch, have been much before the public of late years. All important questions of state in this country go through several phases. They are taken up by men who are considered, if successful, enthusiasts, if unsuccessful, crotchety. For four or five, or it may be for twenty years, these gentlemen bring their pet subjects before the House of Commons year after year, and nobody pays the least attention to them. They are then in the mythical stage ; gradually the public or the press begin to think that there may be something in them. The divisions taken upon them in the House are scanned with some interest, and men consider how their constituents would wish them to vote upon them. They have then got into the early-history stage. The public become more interested in the questions, and the Government of the day are embarrassed to know how to deal with them. This gives rise to the Royal-Commission or Parliamentary-Committee stage, and the questions become matters of theoretical importance. The Royal Commission is issued. Being composed, as such things always are, mainly of members of Parliament and judges and other busy men who have more than enough to do in attending to their own work, the Commission takes four or five years to take evidence, collect statistics, agree upon its report, and frame it. The Report lies on the table of the Houses of Parliament for a year or so, when some one calls attention to it, and asks the Prime Minister, or the Minister to whose department the report refers, whether the Government mean to deal with the subject. The Minister thus interrogated gives an evasive answer, fears it is impossible to do justice to so important a subject during the present session,

but promises to give it his best consideration during the recess. This declaration brings the matter into the domain of practical politics. Nothing is done during the next session, but in the subsequent session a bill framed during the recess, and revised and re-revised by committees of the Cabinet, and perhaps by the entire Cabinet, is introduced, and the discussions upon this bill become the events of the year, and fill columns of all the metropolitan and the provincial newspapers during a whole Parliamentary session. The bill probably becomes an act of Parliament, unless it deals with matters which offend the dignity, or imperil the position, of the House of Lords, in which case it is thrown out by that body and stands over for another session. A public question, dealt with in this way, and most public questions are so dealt with, lasts about a quarter of a century, and then it comes to maturity.

National education has undergone this sort of treatment in England In 1833, the question of giving Government grants for educational purposes was mooted. In 1843, Lord Ashley brought forward a motion on the subject, showing that at that time the education grant for all England was only some £30,000, and that between one and two million children were growing up without education. In 1858, the question got into the commission stage, and in 1870 the Education Act was carried. In Scotland, the subject has been similarly treated—individual efforts for a series of years, a Royal Commission, and an act of Parliament, thirty years after the first gaspings of the question. Educational endowments have in both countries reached the stage of practical politics. Both countries have had their Royal Commissions. England, indeed, has had three Royal Commissions dealing with the subject. Under the first, an enquiry was instituted into the nine great public schools—Eton, Winchester, Westminster, Charterhouse, St. Paul's, Merchant Tailors', Harrow, Rugby, and Shrewsbury. The second took up all the grammar and secondary schools in England, those standing midway between the elementary schools on the one hand and the nine public schools on the other. By the third, the revenues of Oxford and Cambridge were dealt with to this extent at least, that a full report upon the amount of funds in the possession of these institutions has been published, but without any recommendation as to the better application of the revenues. Acts of Parliament carrying out the recommendations of the two first of these Commissions have been passed, and are working fairly well. The report of the third is still lying on the table of the two Houses of Parliament, waiting for some one to call attention to it. But it is a large subject, full of difficulties. A timid Government like the one that now governs England—timid, I mean, in the sense of being afraid of exciting the hostility of classes in the country, or of individuals with votes, against itself—will not venture to deal with anything so risky, with anything, that is, which affects so many interests. The report will lie on the table of the two Houses for years before any action will be taken on it. Indeed, it is safe enough to prophesy that, until we have a change of Government and a ministry seated on the Treasury Bench with sufficient moral courage to venture on measures which may be unpalatable to influential interests, the wealthy endowments of Oxford and Cambridge, amounting in all to an annual revenue of £750,000, will remain untouched, doing no more good and probably no more harm than they have done for the last two centuries.

Scotland has just emerged from the operations of her Commission. Attention was, last Friday, directed to the report. The Government have promised to give it their consideration during the recess. Nothing, in all probability, will be done to carry out the recommendations next session—Government will still be considering the report. But the session of 1877 may produce a measure which will be carried in due course of time—all in the stereotyped form.

Funds reported on by these four Commissions and available in one shape or another from old foundations, and applicable in the main to secondary or higher instruction, exist in England and Scotland to the amount of something like one million and a half (sterling) a year (£1,500,000). Half of this belongs to the universities ; a fifth of it to the grammar and secondary schools of England ; and the remainder, in about equal proportions, is applicable to the nine public schools and to educational purposes generally in Scotland. The Commissioners who have reported upon the school endowments, both those of England and those of Scotland, concur to a large extent in their recommendations. They state that the funds were for the most part left some two or three hundred years ago by pious founders, who, seeing the want of educational institutions, especially for the poorer classes, desired to perpetuate their own names and improve the intellectual condition of their fellow-countrymen by providing means of education for the children in the locality in which the founders were interested. Within the last half-century, these funds have enormously increased in value. Means of education have at the same time been provided by the state, and facilities for locomotion have extended in a manner that could not have been foreseen when these foundations were instituted. The conditions of life are radically changed from what they were two hundred years ago. If these pious benefactors were now alive, they would, looking to the best interests of education, be the last people in the world who would wish to see their money spent in providing only the appliances of two hundred years ago. Schools built like monasteries, surrounded with high walls, and school-boys leading the lives of young Protestant monks, removed from the temptations and troubles of a wicked world, were very proper in the wild times of two hundred years ago. But nowadays, when the times are peaceful and orderly, and where life is free, it is a mistake to train up a lot of boys to lead monastic lives, such as they do in those cloistered palaces which surround Edinburgh in a circle, and are known in Scotland by the name of "Hospitals." In the old days, when no means of education existed for the poorer classes in any particular district, and no means of leaving the district short of expatriation were imagined, it was an excellent thing to found a school and provide for the education and maintenance of the poorer children in the district. But such conditions are now impossible. The state provides for the education of every child, and railways provide a means of moving from one locality to another. For these and similar reasons, one set of Commissioners after another have recommended that powers should be given by Parliament to the trustees of the foundations, or the governors of the several institutions reported on, to relax a little the stringent interpretations of the different deeds under which they severally act. In some cases, they have gone further and recommended that an executive commission should be appointed to assist the trustees or governors to prepare schemes for altering and modifying the trust-deeds, and even departing from them, with the view of making the foundations more suitable to the requirements of the present day. And certain of the Commissioners have been bold enough to recommend even more active measures in the direction of making it imperative on the trustees and governors to set their foundations to rights, giving power to the executive commission to do it for them if they fail.

The policy of these recommendations was touched on in the discussion of Friday. Mr. Grant Duff and Mr. Lyon Playfair, as might be expected of them, took at once an enlightened and practical view of the subject. They ridiculed the policy urged by one or two of the more weak-kneed among the speakers, that no alteration should be made in the foundations, and that no interference with the pious bequests of the bequeathers should be sanctioned. Mr. Macdonald, the miners' representative, was the warmest defender of existing abuses. He would protest against the smallest interference with the letter of the bequests. They were left for the education and maintenance of the poor of a locality, and, notwithstanding that the poor were amply provided for otherwise, these foundations, magnified a thousandfold from what they were originally, should be preserved intact for their original purposes. It was curious to hear a man who arrogates to himself the monopoly of representing the ideas of the workingmen take such a line as this. Funds were left for the purpose of releasing English captives from Barbary, as Mr. Lyon Playfair stated, and other funds were left for the purpose of killing ladybirds on Ludgate Hill—both excellent purposes in their way. But there are no British captives in Barbary, and no ladybirds on Ludgate Hill, and Mr. Macdonald would insist that the funds bequeathed for these purposes should be preserved intact until there were captives in Barbary and ladybirds on Ludgate Hill. Mr. Lyon Playfair is an old educationist who has seen the mischief that is done by the abuse of obsolete foundations. Mr. Macdonald, though as old in years as Mr. Playfair, is but a baby in educational questions. It is unnecessary to say that the feeling of the House was with the tried man, and not with the infant.

## SWISS NEWS.

GENEVA, July 16.

THE great bell of the Cathedral of St. Peter is tolling, and the sound of minute-guns is echoing to and fro between the Salèves and the Jura, for the funeral of the most illustrious of Swiss citizens and soldiers. William Henry Dufour, the hero of the war of the Sonderbund, of whom his fellow-citizens have long been wont to speak, with no small reason, as the "Washington of Switzerland," died on the 14th at his dwelling near Geneva, and this afternoon the whole people of the canton, with representatives of the national government, are gathering in the cortége that is to attend his remains to the ancient cemetery of Plainpalais. Since Switzerland became a nation, she has never mourned for a worthier son.

The great achievement of his career, the war of one campaign against the secession of 1847, would have been enough to endear him to his

country as its savior, even if his life had not presented many other claims to public gratitude and respect. I will not insist again at this time on the striking parallel between the Swiss and the American wars of secession. But as I look back on the early months of our war, when we were all fretting because General Scott was so slow, the thought occurs that the old man was aiming to reproduce the splendid work accomplished by Dufour so few years previously. The latter refrained from all armed collision until his full force was completely organized and equipped. In a country in which no force can be reckoned overwhelming and no enemy inconsiderable, he marshalled his imposing army with admirable strategy to compel an engagement upon advantageous terms, and the one conflict, resulting in the surrender of Fribourg, closed the campaign and the war, in the complete victory of the Union. But nothing in the war was so admirable as the prompt, hearty, and ungrudging peace which followed it, the blessings of which were gratefully ascribed on both sides to the knightly generosity and delicate tact of the commander of the victorious army. It is a singular testimony to the rare dignity of his character, that to-day the familiar picture of Dufour on horseback at the head of his staff should be hanging in almost every *chalet* of the lately rebellious Catholic cantons, and decked with tokens of mourning by the hands of the old soldiers of the secession.

There were many other public services rendered by General Dufour such as entitle him to a place in history. His engineering exploit in the construction of the Pont des Bergues gave him rank as Pontifex Maximus of the little republic. The first railroad in the canton, if not in the confederation, was constructed under his direction. The superb military map of Switzerland, known to all scientific travellers as Dufour's map, was the work of himself and his staff. His latest public act was that of presiding over the Geneva Congress of 1863, assembled to provide protection in international law for those who undertake the relief of soldiers wounded in battle. Having been during his whole life, military and political, a devotee of no party, he is mourned alike by all parties. In this respect, the day of his funeral is spoken of as an unprecedented day in the recent history of Geneva. Speaking generally, it may be said that the tempests in this tumbler of water never cease to rage. But to-day, when the places of business are closed by universal consent, even the restless demagogues of this fierce democracy have agreed to shut up, for the first time in a generation, their favorite temple of Janus Bifrons, and declare a Truce of God.

The fair city of Geneva, on this day of the pageant, is presenting an aspect strangely battered and forlorn. The trees are ragged with torn and shrivelled leaves and broken branches. The windows are shattered, and the slats of the window-blinds, dislocated and split, are hanging endwise. The skylights of the great hotels—so conspicuous a feature in most views of the town—are boarded over with fresh planks. In the suburbs and the neighboring country, particularly in Savoy, and in the valley of the Arve and Rhone below the city, the vine-crop is destroyed, and even the roots in the kitchen-gardens are mashed and killed by the plague of hail that came last week. Such a throwing of great stones out of heaven has hardly been recorded since the battle with the Amorites in Beth-horon, as thou goest unto Azekah and unto Makkedah. The result is likely to be a somewhat expensive addition to meteorological science; for in a town where so large a proportion of the population are members of some scientific association or other, it was the instinctive impulse of a multitude of people, first to shut their window-blinds, and then to get out their balances and commence measuring tapes and taking the weight and circumference of the hailstones in grammes and millimetres. The largest well-authenticated weight that I have seen reported is of about a pound and a half. But by frequenting the cafés, one may doubtless hear of stones twice that size. The most striking fact connected with the storm is that it was almost simultaneous with like storms at the outlet of two of the other principal lakes of Switzerland. Here at Geneva, the chief violence of the storm was concentrated about the confluence of the Arve and Rhone. In that region, the tiles upon the roofs were crushed under the falling blocks of ice. It was well for the people that it came at midnight; otherwise there could not but have been serious loss of life.

Naturally, with the usual perversity of Christian people in always resisting the teachings of the Bible on this point, from the story of Job's calamities down to that of the victims of the tower of Siloam and the man blind from birth—naturally, the Ultramontane prophets and priests find in these signs from heaven the indication of divine wrath at the ill-treatment of their sect; but are embarrassed, as such interpreters of the Divine mind are apt to be, by the awkward distribution of the judgments—faithful Toulouse that broke its Protestants upon the wheel, and Pesth-Ofen, unimpeachable n its Catholicity, having suffered worse than Geneva, while Soleure and Berne, whose sins against the Church exceed even those of the Genevese, suffer neither waterspouts nor hail. But really the succession of such disasters is extraordinary, and, if the moral explanation fails, it would be satisfactory to find a physical one. As for the freshets, they are easily enough explained by last winter's extraordinary snows. The Rhone is rapidly swelling, as the season advances, to the highest high-water mark of previous years. But this will hardly throw light on the waterspouts, the hail-storms, or the South American earthquakes.

The religious quarrels of Switzerland show no disposition to abate. The alienation between Hyacinthe and his late Liberal-Catholic associates is becoming more and more acrimonious, and puts an end to whatever prospect there may have been of his leading any extensive "Catholic Reformation"; while, on the other hand, it leaves the new political Catholic Church poorer than ever in all elements of moral dignity and strength. The Liberal Catholics are now occupying Mermillod's great church of Notre Dame for their services, and are hoping in some measure to make good the loss of Father Hyacinthe by securing for the vacant place the Abbé Michaud of Paris. But in the Bernese Jura, where the Protestant government of the canton has given to the new priests the churches, the parsonages, the salaries—everything, in fact, but the congregations, who decline to be transferred—it is found that so much of the action of the canton as banished the ejected curés from their old homes, and forbade them access to all their former parishioners, is contrary to the new federal constitution. By the middle of next November the old priests must be allowed to come back again; and it is prognosticated that from and after their arrival the weather in those mountains will grow unseasonably sultry for the *intrus* or *apostats*, as their successors are indifferently called.

I have space enough left for a few words on the subject of the Centennial Exhibition and its prospects in Switzerland. The Federal Diet has shown a cordial liberality in appropriating 250,000 fr. towards the expenses of the Swiss Department. But it is obvious that there is a perilous indifference, to say no worse, on the part of those on whom the success of the Exhibition absolutely depends—the manufacturers. A friend of mine in Germany, whose opportunities of exact information are unsurpassed, tells me that the feeling among the manufacturers of his region is more than indifference—that it is positive objection to exhibiting. From some quarter, malicious or at least mischievous stories, like the story that the goods of exhibitors would be liable to seizure for the debts of the Exhibition, are set in circulation. And it is boldly charged that some of the large importing houses conceive it to be for their interest to hinder that direct relation between smaller dealers and the producer that might result from an exhibition of the various products at Philadelphia. The Commission has serious need of a score or two of effective agents, well supplied with documents, to present in person to the manufacturers of Europe the reasons for their being well represented next year in the Philadelphia Exhibition.

## Notes.

J. B. LIPPINCOTT & CO. have in press 'The History of Co-operation in England,' by George J. Holyoake, and 'The Bric-à-Brac Hunter,' by Major H. Byng Hall.——Ginn Brothers publish immediately Hudson's 'Text-book of Poetry,' for use in schools and colleges.——Dr. Elliott Coues's 'Abstract of Results of a Study of the Genera Geomys and Thomomys' forms a part of the report of Powell's Exploration of the Colorado, and is published separately by the Smithsonian Institution. The gopher's chief utility appears to lie in the light he sheds on the development theory. Dr. Coues concludes that Geomys has, in the language of that theory, been longer in developing species than Thomomys, and has consequently "made itself into five or six firm species before Thomomys has succeeded in turning out more than one or two." To the scientific discussion a popular account of the habits of the Florida "salamander" (*Geomys tuza*) is added by Professor Goode.——The July number of the *American Journal of Numismatics* (Boston: A. Williams & Co.) begins the tenth volume. This publication still lacks adequate support, even "the editors themselves paying the subscription price." A steel plate in the present number represents the curious copper pieces known as "fugios"—the first coins issued by the United States—and the very rare Massachusetts pine-tree copper and halfpenny (1776) of which the dies are supposed to have been engraved by Paul Revere. ——The *Art Journal* for August (D. Appleton & Co.) has a pretty engraving of the "Young Shepherdess of the Abruzzi," after Michetti's painting, and woodcuts representing, at least suggestively, several of Fortuny's studies. A portrait of this lamented artist, and a sketch of his life by

Charles Yriarte, accompany them. The serial articles are descriptive of Landseer's here first published studies and sketches; the "Stately Homes of England"; and the Hudson River. The last-named series has also just been published connectedly under the title, "The Hudson River by pen and pencil, for tourists and others." It is cleverly illustrated by J. D. Woodward, and it is easy to forgive the little-travelled compiler of the letterpress for asserting that the Hudson excels in grandeur, in boldness of shore, and in the "broad majesty of its current," the Mississippi and the Missouri, the St. Lawrence, the Rhine, and the Danube, and apparently all other rivers. ——The announcement is made that Mr. J. C. Rodrigues, hitherto the sole proprietor and conductor of the newspapers *O Novo Mundo* and *La America Illustrada*, has disposed of them to an association of which he is the publisher and treasurer, and which will also carry on a general printing and publishing business in the Portuguese and Spanish languages. The success of these periodicals has been remarkable, and promises, under the new arrangement, to be even greater and more assured.

—The city of Hartford is famous for its private libraries, and is well known to have also a cultivated society, and to be the seat of a great deal of solid learning. We regret to observe, therefore, the difficulty which so old an organization as the Young Men's Institute experiences in keeping along. Indeed, from its thirty-seventh annual report, just received, the danger of its being compelled to close its doors appears very imminent indeed. And yet the library of the Institute is a very respectable and useful collection, numbering upwards of twenty-four thousand volumes, and well abreast of the publications of the day, and the reading-room is liberally supplied with American and foreign periodicals. The catalogue issued in 1873 is a very creditable offspring of the Boston Public Library's Catalogue, and answers every purpose of those who wish to consult the library. Nothing seems wanting but the public spirit to maintain the labored accumulation of three-quarters of a century; and such is the state of the Institute's finances that a writer in the Hartford *Evening Post* appears to think the only salvation lies in making a free library of it. If the city authorities are disinclined to take this step, there is wealth enough in Hartford to make the transformation easy. We venture to call the attention of worthy citizens who are now arranging their wills with reference to the founding of a new college in New England, to the opportunity which lies at their doors of putting their money where it will do more good.

—"T. B." writes us from Rochester: "I have never been in Africa. I do not know Dr. Nachtigal. I have seen neither his interesting account of his experiences in the Kingdom of Wadai, nor the *Pall Mall Gazette's* abridgment of it. But I read my *Nation*, and desire to believe all that I read in it; and when you call upon me, as you do in your No. 526 (July 29), to believe that the new-discovered realm contains 2,500,000 people upon an area of 3,000 square miles, my confidence is shaken. The population is certainly thick enough, but the story is 'too thin.' The simplest arithmetic suffices to show that upon an average square mile of this flourishing kingdom there are 833⅓ citizens of African descent. Yet in our State of New York there are but 100 persons to the same area; in Massachusetts but 150; and in compact and crowded little Belgium, with the densest population in the world, until the song of this delusive nightingale was sung, but half of the 833. But it is not in the least probable that Dr. Nachtigal said what is attributed to him. My purely *à priori* explanation is this: Dr. N. is a German, and addresses in German the Berlin Society. The *Gazette* is English, and makes a blunder which I have seen so often lately—even in the *Nation*—that it seems worth calling attention to with some special emphasis; and the blunder of the *Gazette*, which you would not have committed at first hand, you adopt by mere inadvertence. The German linear mile = about five English miles; the German square mile, therefore, = about twenty-five English; and the population of an African monarchy is the much more probable average of 33 to the mile, upon an area of some 75,000 square miles."

—In our article in No. 525 on "Class Morals and Government Morals," we spoke incidentally of the officers of the regular army as the one "body of men for the service of the state with morals rather above the average morals of the community at large." Some of our friends in the navy have delicately reminded us of an omission which we certainly had no intention of making, and of an apparent discrimination which we should be the first to repudiate. We unconsciously used the army as the type of the full military service of the country, the discipline of the two branches being essentially the same, and its effect on the character of officers precisely the same. In any comparison the navy has the disadvantage of being more out of mind, because, from the necessities of the case, more out of sight; but everybody knows that its administrative record is, in all respects, as clear and honorable as that of the army, and we regret that we should have seemed to imply the contrary.

—The latest novelty in journalism has enough merit in it to make one regret that it has fallen into vulgar hands. The third and fourth numbers of the London *Obituary* are before us, a weekly newspaper styling itself "a special organ of information and intercommunication at home and abroad." Its title is anything but cheerful; its pages are bordered with mourning rules; and its illustrations thus far are of cemeteries and tombs. Nevertheless the projector confidently expects to make it acceptable even to the young, and quite "indispensable to monumental sculptors, masons, and that trade generally." Not only will it be cherished in clubs, libraries, exchanges, and banking-houses, and be duly appreciated by solicitors, notaries, probate courts, and "those who seek next of kin," it will also "supply a handsome portfolio to adorn any drawing-room table." The record of deaths is of course the chief feature of the paper, and one can easily see how much (if it ever became the fashion to advertise in it as in the daily papers) this would recommend the *Obituary* to colonial readers, and how profitable it would be to the proprietor at five shillings the insertion. From an English point of view we judge this to be an idea worth carrying out, and the inventor has fairly conceived the necessities and the possibilities of his enterprise. The monuments of the illustrious dead furnish an exhaustless fund of artistic and historic material; and biography, genealogy, the statistics of population and of sanitary science, offer abundant supplies to the judicious editor. Some of the topics treated in No. 3 will illustrate the scope of the *Obituary*, and suggest other means of making the publication anything but dismal or repulsive: Old St. Paul's; Westminster Abbey, with Queen Eleanor's monument; Memorial Statue to Richard Baxter; Memorial to Byron; Greek Epitaphs; Proposed Wicker Coffin; Registrar-General's Report; Wills and Bequests (a regular department), etc., etc. The articles on "An English Officer Killed by a Tiger" and on the "Burial of the Ancient" at Columbia College might or might not be excluded by a severe taste. Such is certainly not the editor's, and we were thinking partly of that when we said the undertaking had fallen into vulgar hands. His own writing is slovenly and uncultured; he ekes out his columns with wishywashy and goody sentiment, and with "humor" which, we are sorry to say, is too often American; and his discrimination in making poetical extracts is not much above that displayed by afflicted relatives in the Philadelphia *Ledger*. He warns the public, however, not to "look for exciting tales and death-bed scenes" in his columns. The typography and general air of the *Obituary* are little attractive, and its illustrations are cheap. A very different thing it would have been if it had imitated the get-up of *Vanity Fair*, for example, and had used the heliotype from nature instead of photolithography in line copying.

—We learn from the *Athenæum* that Misses Jane and Isabella Bewick, of Gateshead, ladies now well advanced in years and daughters of Thomas Bewick, have signified their intention to bequeath the British Museum their entire and "probably complete" collection of proofs of cuts executed by their father and his less famous brother John. Some of these proofs are all that remains of the designs, the blocks and the original impressions having disappeared. They have all been classified chronologically in two large volumes by the Misses Bewick, and will be authoritative in determining the proper work of each of the several artists who bore the name of Bewick. With them are bound up a collection of original drawings by Thomas Bewick, partly, we surmise, "inedited," and partly studies afterwards engraved. We have often wondered how much Bewick delineated on the wood and how much he trusted to his graver. His immense productiveness led us to suppose that his design was slight before he began to cut it, especially if he had the object before him. That this was not always the case appears from the statement of the *Athenæum*: "Many of them [the drawings just referred to] are most exquisite little works, the tail-pieces and birds being especially beautiful; a small water-color drawing of a quail is charmingly delicate and precious beyond the common, and so are some of the original drawings for the famous feather tail-pieces. If Thomas Bewick had done nothing more than these tail-pieces, his fame would have been established." Those whose privilege it has been to visit the Misses Bewick have been shown their father's blocks carefully preserved in glass cases, and still capable, after all their usage, of giving clear and distinct impressions. They are not alluded to by the *Athenæum*, but their destination can hardly help being ultimately the British Museum.

—The Cable despatch announcing the death of Hans Christian Andersen gives the final intelligence of a career which, on the whole, was singularly fortunate and happy. We have indeed his own word for this, for in one of his books he has made the remarkable statement that were his life to be lived over again he could not ask that anything in it should be altered; yet his life was no exception to the general rule that the penalty of genius is suffering. Though he could look back on his early years with that pure content inspired by a true religious sense, there is no doubt that his childhood and first years of youth were only prevented from being profoundly unhappy by the soundness of his disposition and the buoyancy of his hopes of the future. His father belonged to a family that had once been rich, but for all that his child was the son of a poor shoemaker, discontented, naturally, with his lot, and seeking relief for his feelings in telling his children and friends stories of the former splendor of the family. This was hardly the education to encourage content and submission; but, to make matters worse, the boy, who was a sensitive, delicate, imaginative child, lost his father when he was only nine years old. He learned to read and write, and but little more, at a charity-school, and after his father's death he was sent to work in a factory, where he made his first acquaintance with the coldness and ingratitude of the world, the workmen, whom he tried to amuse by singing and reciting passages of poetry, giving him abuse and blows in return. Notwithstanding the aptitude which he early showed for dramatic literature, his mother determined to apprentice him to a tailor, while he, on his part, was trying to get some common employment about the theatre at Copenhagen. Misfortune seemed, however, to cling fast to him, and he was rejected on account of his awkwardness and ignorance, and obliged to apply to a joiner for employment. This occupation, for some reason, soon came to an end, and Andersen was thrown upon the world in a strange city at the age of fourteen, without money or friends. There was nothing left to try but his voice, which was a promising one, and he applied to the director of the Royal Conservatory, who found means to have him educated as a singer for the stage. At the end of six months his voice gave out. For two years he struggled on as well as he could, when suddenly the tide turned, and, his talents of one kind and another beginning to attract attention, the director of the theatre obtained permission of the king to have the boy educated at the public expense. At the age of twenty-three his success began with the publication of 'A Journey on Foot to Amak.' His poems and novels—particularly the 'Improvisatore'—soon gave him a world-wide reputation, but it is probably his stories for children which have made him best known and most endeared him to people of our race. He was fortunate in having for his translator Mary Howitt, who, though she may not have caught all the delicate shades of the original—if there can be said to be any original in the case of a writer who is equally enjoyed in any language—she certainly got the spirit of his humor, of his pathos and his simple morality. His stories for children might be regarded, if we did not know Andersen to be a born story-teller, as wonderful *tours-de-force*, so remarkably do they unite the interest of the old-fashioned fairy-tale handed down to us from generation to generation from our Aryan forefathers with the more subtle and refined interests that appeal to the conscience and heart. It is this last feature which makes his stories something beyond mere children's stories; so that the child who has read them may in later life read them between the lines, and find a deeper meaning in the chequered career of the little Tin Soldier and in the wonderful adventures of the Snow Queen than he dreamt existed before. It is impossible to believe that these charming stories could have been written except by one who had in his childhood often "eaten his bread in tears"; and so we too, who have read them, may say with Andersen, though more selfishly, that we should have regretted it if even his early life had been other than what it was.

—A remarkable contribution to the subject of European folk-lore has recently appeared at Palermo. Giuseppe Pitrè, a native of that city, has made the traditions of his country the study of his life, and has embodied the results of his investigations in his 'Biblioteca delle Tradizioni Popolari Siciliane,' in seven volumes. The first two volumes contain a collection of popular ballads and songs, the third a series of essays on popular poetry, and the last four a collection of tales in the style of Grimm's 'Hausmärchen.' Rich as Sicily is in popular poetry, it possesses a still greater wealth of popular tales, comparatively few of which have ever been published. In 1870, Otto Hartwig published at Leipzig ninety-two Sicilian tales, collected and translated by Laura Gonzenbach, with learned annotations and references by Köhler, and at the end of the second volume a few of the stories were given in the original dialect. But the present collection far excels anything previously done in this field in Italy and, we had almost said, in any other country, and is a monument of patient erudition and sound criticism. The stories are all given in the dialects of the places where they were collected, and these dialects are carefully and, for the first time, scientifically examined in the grammar. Finally, the glossary contains three thousand words. Our space will not allow us to say more than a word about the general character of these tales. In a country subjected to such vicissitudes as Sicily has been under the successive occupation of the Greeks, Romans, Arabs, Normans, French, and Spaniards, we should naturally expect to find traces of all these nations in the popular traditions. Such traces do in fact exist, but only to a limited extent, the great mass of the stories being the common inheritance of all Indo-European nations. Pitrè intends to continue his work with a collection of Sicilian proverbs, popular festivals, and children's games. He has in the May number of the *Rivista Europea* an interesting article on "Sicilian Popular Botany," giving the current insular traditions in regard to various trees and plants.

## A BEGINNER IN BOTANY.*

MR. RUSKIN, "having been privileged to found the School of Art in the University of Oxford," now proposes to found a new school of botany. Of course, it will be a vagarious school. One crying evil to be remedied is "that there are generally from three or four up to two dozen Latin names current for every flower," and "the most current and authoritative names" are "of the devil's own contriving." This is not seemly. As Wesley would not allow the devil to have the singing of all the good tunes, so neither will Ruskin allow him to have the naming of all the sweet flowers. He proposes "to substitute boldly . . . other generic names for the plants thus faultfully hitherto titled." He "will not even name the cases in which they have been made," but will "mask those which there was real occasion to alter by sometimes giving new names in cases where there was no necessity of such kind." That is to say, the evil of a redundancy of botanical names is to be overcome by making more, some of them avowedly needless; and innocent names are to suffer, lest bad ones should become notorious by being discarded without company. For it appears that the diabolical names to be sent to their own place in this reform are not discarded because they are cacophonous, although that is the common charge, but because they are immoral. Of the two evils to be dealt with, the first is simply a superfluity of Latin names; the second, and the worse, a superfluity of naughtiness. As Mr. Ruskin forcibly puts it:

"The second, and a much more serious one, is of the devil's own contriving (and, remember, I am always quite serious when I speak of the devil)—namely, that the most current and authoritative names are apt to be founded on some unclean or debasing association, so that to interpret them is to defile the reader's mind."

This reminds us of the fine lady who thanked Dr. Johnson for omitting indelicate words from his dictionary, to whom the blunt moralist rejoined: "I perceive, madam, that you have been looking for them." Now, if the case be really as is represented, the sound practical axiom, "Quieta non movere," would seem to suggest the proper treatment; for his purposes, one would think the Latin and Greek names might be left untranslated; and the reform might begin, and end, with the popular English names—almost the only ones the author may need to use—some of which are coarse and vulgar enough. Indeed, as to botanical generic names, far from finding any confirmation of Mr. Ruskin's sweeping charges, we can recall barely one or two the translation or etymology of which would be embarrassing at the parlor-table. Moreover, if the following passages really refer to "nomenclature" (though terminology seems to be meant), our author, upon his own showing, need not waste his time in the endeavor to reform it:

"The mass of useless nomenclature, now mistaken for science, will fall away, as the husk of a poppy falls from the bursting flower. . . . When the science becomes approximately perfect, all known plants will be properly figured, so that nobody need describe them, and unknown plants will be so rare that nobody will care to learn a new and difficult language in order to give an account of what in all probability he will never see."

Well, for that matter, the English Botany, in its various editions, furnishes fairly good figures of all British plants; and the *Botanical Magazine*—a page of an early number of which, eighty years old, is gibbeted by Mr. Ruskin—has gone on to figure more than 6,000 cultivated exotics, and is continuing at the rate of nearly a hundred a year. So that our author's ideal is practically all but realized already. There are well-nigh pictures enough, if one knows how and where to find them. And it amusingly appears, from Mr. Ruskin's trouble with St. Bruno's lily at the beginning, and from his investigation of moss further on, as well as from scattered

* 'Proserpina: Studies of Wayside Flowers, etc. By John Ruskin, LL.D. Part I.' George Allen, Sunnyside, Ossington, Kent; New York: John Wiley & Son.

statements, that his mode of proceeding in systematic botany is the simple one of searching high and low for a picture to match the specimen in hand. Accordingly, it is not surprising that his "botanical studies were, when [he] had attained the age of fifty, no further advanced than the reader will find them in the opening chapter of this book."

As to this, the conclusions which the reader will draw are all along anticipated by the author. Next to the pervading—well—bumptiousness, nothing is so prominent in the book as the profession, not to say the parade, of ignorance of the topics treated. As to "the elements of the science of botany," "I can scarcely say that I have yet any tenure of it myself." "And meanwhile I don't know very clearly so much as what a root is or what a leaf is." "Some one said of me once, very shrewdly, When he wants to work out a subject, he writes a book on it. . . . This book will be nothing but processes. I don't mean to assert anything positively in it, from the first page to the last. Whatever I say is to be understood only as a conditional statement—liable to and inviting correction. And this the more because, as on the whole I am at war with the botanists, I can't ask them to help me, and then call them names afterwards." So "for many reasons, I am forced to print the imperfect statement, as I can independently shape it." To get at the facts "I should have to write a dozen of letters before I could print a line, and the line at last would be only like a bit of any other botanical book—trustworthy, it might be perhaps, but certainly unreadable." The converse is preferred. Readable it certainly is, and in its way interesting, not so much for what it tells about botany as for what it tells about Mr. Ruskin; and the art-student, out of the abundance of golden chaff, may pick some grains of knowledge that might not otherwise fall in his way. But the seeker of botanical information must glean warily, especially where the author grows positive. For almost the only instance in which he does pronounce decidedly happens to be a vexed question in vegetable physiology, and there is reason to fear that he decides it wrongly. At least the recent investigators who have had the matter in hand in the way of experimental enquiry, will not agree with him that the plant can get water from the atmosphere directly and "for the most part does so; though when it cannot get water from the air, it will gladly drink by its roots." Still "our natural and honest mistakes will often be suggestive of things we could not have discovered but by wandering." Very likely; but why invite learners to go forth with him upon his wanderings? In many a book the want of sufficient knowledge is pleaded as an excuse; in this, it is paraded as a recommendation. Ignorance, no doubt, has its uses. But it is questionable whether teaching is altogether the best use to put it to. As the member of Parliament who yawned desperately while delivering his speech was thought to trench upon the privilege of his hearers, so the students of 'Proserpina' may complain that the playing of the rôle both of teacher and learner at once involves some incongruity and inconvenience.

The second part of 'Proserpina' has just come to hand. It treats of the leaf and the flower, in a discursive and oracular way, leading into æsthetical questions, where we need not follow and do not greatly admire. Now and then a scientific topic is taken up, and the point missed, as usual. Treating of foliage and its office, we are bid "to think awhile of its dark clear green, and the good of it to you." We look for an exposition of the fact, in which the whole meaning of vegetation inheres, that leaves under the sun's influence create all the food of the world, and are, therefore, the basis of all animal existence. Instead of which we have:

"Scientifically you know green in leaves is owing to 'chlorophyll,' or, in English, to 'green leaf.' It may be very fine to know that; but my advice to you, on the whole, is to rest content with the general fact that leaves are green when they do not grow in or near smoky towns, and not by any means to rest content with the fact that very soon there will not be a green leaf in England, but only greenish-black ones." . . . "Well, this much the botanists really know and tell us"—that vegetation "is made chiefly of the breath of animals." . . . "So that you may look upon the grass and forests of the earth as a kind of green hoar-frost, frozen upon it from our breath, as, on the window panes, the white arborescence of ice."

Mr. Ruskin evidently has no idea of the essential independence of the vegetable kingdom; that, as all the carbon of the breath of animals comes from plants, so they, in their decay, would furnish this material for succeeding vegetation perhaps as rapidly, on the whole, without the intervention of animals. At most, the latter somewhat expedite the decomposition.

"But how is it made into wood?" As to that and matters therewith connected, "under the impression that it had been ascertained, and that I could at any time know all about it, I have put off till to-day the knowing of anything about it at all. But I will really endeavor now to ascertain something, and take to my botanical books accordingly."

Behold the result of the *cram*, "the gist of the matter":

"Hence generally, I think we may conclude thus much, that at every pore of its surface, under ground and above, the plant in the spring absorbs moisture, which instantly disperses itself through its whole system 'by means of some permeable quality of the membranes of the cellular tissue invisible to our eyes even by the most powerful glasses'; that in this way subjected to the vital power of the tree, it becomes sap, properly so-called, which passes downwards through this cellular tissue, slowly and secretly; and then upwards, through the great vessels of the tree, violently, stretching out the supple twigs of it as you see a flaccid water-pipe swell and move when the cock is turned to fill it. And the tree becomes literally a fountain, of which the springing streamlets are clothed with new-woven garments of green tissue, and of which the silver spray stays in the sky—a spray, now, of leaves."

Then as to the blossom: "The flower exists for its own sake, not for the fruit's sake. . . . But the flower is the end of the seed, not the seed of the flower." "The corolla leads and is the object of final purpose. The stamens and the treasuries [Mr. Ruskin's new term for pistils] are only there in order to produce future corollas." Without criticising anybody's notion of final causes, we only notice how Mr. Ruskin fails to make his own point. He has seen "among the speculations of modern science, several, lately, not uningenious, and highly industrious, on the subject of the relation of color in flowers to insects, to selective development, etc." And he proceeds to intimate that even Mr. Darwin must be ranked among "the men of semi-faculty or semi-education who are more or less incapable of so much as seeing, much less thinking about color," etc., referring merely to the latter's speculations upon the ocelli of the Argus pheasant, in blissful ignorance, it would seem, that he has to deal with Mr. Darwin upon this very subject of color and use in flowers, and that he is not prepared even to state his own side of the question.

## THE MYSTERY OF THE NEWSPAPER.*

ANOTHER book has just been published on the great puzzle of modern times, the nature and influence of newspapers, and the qualities necessary to the successful production of them. This is more remarkable than any of its predecessors in the same field, because it is composed almost exclusively of the opinions of editors about their own calling. These opinions, it is true, have already been pretty widely published, but in various periodicals and at various intervals, so that their effect when concentrated in a single volume is something novel, and almost startling. The first thing which strikes one in reading them over is that the writers are deeply impressed with the mystery of their profession. They talk of "News" as if it were an invisible force or afflatus which seized on the journalist, and made him speak whether he would or no, sometimes in the small hours of the morning and sometimes in the small hours of the afternoon, but the coming and going of which, or the requirements of which, no man could predict or explain. No journalist professes to understand News; in fact, if one might judge from some of the essays in the volume before us, News is one of the elements of the Unconditioned. All that the editor can do in relation to it is to prepare himself humbly and devoutly for its reception and diffusion. A drunken man, for instance, hits his wife in the head with the heel of a boot in the Sixth Ward, and she dies. At this point the event is a common murder, interesting mainly to policemen and penologists. But after the reporter arrives and gets the husband's statement and the statement of the woman on the floor above who heard the row, the matter becomes News, and needs a priesthood called journalists to get it into type, and after it is in type it possesses a slightly mystical character, which almost raises it to the rank of a revelation. What it is that makes the public willing to listen, what makes News in one man's mouth more attractive than News in another man's mouth, is the problem over which most writers about journalism are constantly working, and there is something almost comic in the reverence with which they approach the subject and the solemnity with which they discuss it. Those who discuss it most, generally reject with contempt the notion that instruction by argument or exposition is a leading and necessary function of the press. It is, they think, a kind of adjunct which, if kept in strict subordination, and not allowed to interfere with News, may do no harm. The real mission which editorial conventions ponder and debate is the collection of News. And what is News? Who knows? Why are we pensive at sunset? What is life?

For a thorough and satisfactory investigation of one peculiarity of the newspaper profession, and that a very prominent one, we have looked in vain through the volume. None of the contributors have made a serious attempt to explain why editors are so openly and persistently boastful. Public opinion imposes modesty as a necessity on other professions. If Mr.

*'Views and Interviews urnalism. Edited by Charles F. Wingate.' New York: F. B. Patterson.

Evarts were to make a speech once or twice a week showing what an ass Mr. Stoughton was, and asserting that the receipts of his office were falling off, while those of his own were steadily growing; that Stoughton's practice was knavish, while his (Evarts's) was high-toned in an extraordinary degree; and that anybody who trusted Stoughton's law would be sure to be ruined, while Evarts's clients were sure to get rich, the general conclusion would be either that Evarts was insane, or that he was a disgrace to his profession. How is it, then, that Jones can with impunity demonstrate three times a week that Smith is a mixture of depravity and folly, and that nearly all his waking hours are spent in concocting lies of such transparent absurdity that the minute he tells them he is found out? How is it that Smith, on the other hand, can show that while he sells 70,330 pounds of his paper every month, Jones only sells 42,916 pounds of his, without exciting surprise or reprehension? It cannot be said that the calling in which these things are done is so mean or unpretending that these crowings are not worth notice. There is no calling with loftier pretensions. Both Jones and Smith discuss the widest possible range of topics, and offer advice on all the problems of life with as much authority as any preacher, and with more ability than most preachers. Jones's 43,000 pounds of journalism contains sermons on the immortality of the soul, on the education of children, on the immorality of war, and the nature and use of credit. He covers more ground than any preacher in this city. Why, then, are people not shocked when he follows an article pointing out the grounds of our expectation of future life by another showing that Smith's chances of immortality are so small as not to be worth mention, and that his paper is almost certainly maintained by robbery?

We offer, as possibly throwing light on this obscure branch of a difficult subject, the following suggestions: The reason of an editor's unblushing boastfulness, or of the patience of the public with it, is that he has a sort of subconsciousness that his readers are partners with him in his business, and that when he brags, he brags on their behalf as well as on his own, and his braggartry, therefore, assumes the impersonal character of *esprit de corps*, and passes as a man's boastfulness about his regiment, or his church, or his state, or any other large corporation of which he is a member. He gets into this belief through the reflection that his readers share his opinions, as is shown by their reading him, that they like his way of collecting news, and that it is only by their pecuniary co-operation he has been able to make his paper the great organ that it is. He and they are, therefore, for all practical purposes one. When he proclaims his own honesty and sagacity and ability, he is proclaiming *their* wisdom and perspicacity, and he heightens the effect of the compliment to them by drawing attention to the low quality of the wares with which the subscribers of his rivals are content. His egotism is, therefore, not as pure and unmixed as it seems. When he contrasts Smith's baseness with his own purity, he does it in the name of the two millions who subscribe to his paper and the three millions who borrow it.

The subscribers, on their side, fully share in this feeling. They think they are partners in the enterprise. They come to look on the editor as an agent they have employed to put their opinions into shape, to distribute their praise and blame in the quarters in which they believe them to be due. When they read his account of the superiority of his paper to the sheet published by Jones, they feel that he is only stating the bare truth; that they have indeed built up and are supporting just such an organ as he describes, and are not surprised that he sells 70,000 lbs. a month to Jones's 43,000. Why should the truth be concealed? they ask. Why should the world not know the great work we are doing for religion and humanity? This theory, too, explains the way in which they take the editor to task when he publishes an article with which they do not agree. The article is, let us suppose, on some prominent and interesting public question, on which there is more or less division of public sentiment. It is written with care, and is the fruit of much consideration and attention, and is put forth with a due sense of responsibility. There is no editor who does not often receive, under such circumstances, letters like this:

"Bosh-posh, Sangrado T., April 1, 1875.

"Sir: My name is Brown; I have subscribed to your paper for many years, and generally concur in your opinions. But your article on the grasshopper ravages in last Tuesday's issue was something for which I was certainly not prepared, and which I have read with the deepest pain. I have no knowledge of the subject except what I get from the papers, and have not given it any particular consideration; but I am satisfied you cannot honestly have reached conclusions so widely differing from mine. Nor have I the time or inclination to discuss the matter with you. If I had, I doubt if you have intelligence enough and candor enough to consider what I would say. What I do say now is that you are entirely wrong, and wrong, I fear, through the workings of a malignant and disingenuous mind. That the grasshoppers are not the beasts you take them to be is the opinion of many good men of my acquaintance; your assertion that the damage they did has been exaggerated has been a great shock to many of your admirers. If you cannot take any other position than this on the matter, pray let it alone. I have burnt your last number in order to keep it out of the hands of my family.

"Hastily yours, John Brown."

Here the subscriber's theory clearly is either that his partner, who has been left in charge of the concern in his absence, or has been charged with the active management of it, has been doing illegitimate business, or that a tradesman whom he has employed to furnish him with a certain commodity according to sample has been trying to palm off on him an inferior article. A sharp rebuke, therefore, and not discussion, is what the case calls for, and the obscurity and insignificance of the subscriber is no bar to his administering it; for his subscription, small though the sum be, puts him on the footing of a stockholder in the enterprise.

It is no doubt very flattering to editorial self-love to have the functions of the press so much debated as they are now by moralists and economists and politicians. There can be no doubt that these functions are very important, and that the very best man is not good enough for them. But then we make bold to say that editors would discuss them more profitably if they took a less profound or mystic view of them. There is nothing mysterious about the press, in spite of what Mill says about its likeness to the Hebrew prophets, and what Dean Stanley says about the likeness of editors to "crouching tigers." It has two departments: one, the collection and arrangement of news; the other, comment on it. The collection of news is not the work of a prophet or apostle. It is precisely the kind of work done by a dry-goods "drummer," and anybody who succeeds in the dry-goods business would probably publish a good *news*paper. The great mass of the contents of a newspaper has only commercial importance—that is, is only important because people want to know it, and are willing to pay a small sum for the knowledge. The calling of a man engaged in the business of supplying this demand is about as lofty as that of the proprietor of a soda-water fountain at a race-course on a hot day. No demand is made on the higher qualities of an editor's mind or character until he undertakes to assign space or prominence to news in the order of its importance. To do this successfully requires a good deal of knowledge and experience and a good deal of honesty; and the way in which it is done goes far towards determining the value of the press to the public. But then there is nothing mysterious or abstruse about this either. Most men are not equal to it; but then most men are not equal to success in anything but manual labor. That the public has been hitherto badly served in this particular there is no denying. Very few editors make a pretence of serving them at all. The management of the perspective is apt to be left to the lowest hands employed on the paper. Correspondents and reporters are allowed to fill space to suit their own fancy or convenience, and treat subjects in their own way without proper supervision from the chief, and with results which are often sickening. But in these things, as in others, there is rapid improvement. A greater and greater number of editors every year begin to feel the responsibility of the presentation of news after they have got it together, and of the selection of things to be noticed or reported out of the vast mass which the telegraph now brings to their doors. But in the arrangement of news the editorial articles necessarily play an important part. They are, so to speak, the turning on of the light. They point out what is important, and what is trifling; what the reader had better weigh and remember, and what he may pass over and reject; and anybody who treats them as a mere insignificant adjunct has little to say about editing that is worth listening to. Those who think the commentary of small moment are apt to assign a mysterious character to News, in order to give some sort of dignity to the newsmonger's calling; but then a newsmonger who prints such stories as he can pick up is no better or more sacred than his predecessor who hawked them about the market-place or told them over a pot of beer in the tavern.

## NEW NOVELS.*

'WARD or Wife?' we suppose, must have been written by either a man or a woman; and yet we are sorry to think that it is necessary for either sex to be charged with its production, for a more vulgar and stupid tale we have seldom met with. The story is simple and unobjectionable enough: it is that of a young girl and her guardian, who subsequently becomes her lover and marries her. There are, of course, some other characters, but little is made of them, and much less might have been made with great advantage. The hero is James Tregarvan, generally called "Jim," a retired officer who has squandered his money, and is obliged to give

* 'Ward or Wife? A Romance.' New York: Harpers.

fencing lessons in a retired town in France, where he takes to live with him the child of an old comrade, whose name is Wilhelmina, or more shortly "Min." In this quiet French town this reduced gentleman, living under an assumed name, and his ward are discovered by old acquaintances, who, instead of meeting the questionably respectable pair with the stony British stare, insist in the most friendly way on renewing their acquaintance, invite them to come and see them, and almost before one can say "Jack Robinson" adopt "Min" as their daughter. Min has meanwhile come into some property, which is really her guardian's, but which he puts in her name, so that he may give her every advantage; and for himself goes on teaching fencing and *le box*. Min's new friends take her to England, and bring her out in such society as that island affords, which must be, from the description of it given here, quite equal for vulgarity and slang to any of ancient or modern times. We have no space for long extracts to prove this statement, but a conversation between Jim and Min after dinner (her education being now completed) will illustrate the tone of the book:

"'Can't believe it's you sitting there. I keep fancying I shall awake, find it to-morrow morning, and all this a dream.' 'Pinch yourself, Jim,' she advises. 'Too comfortable. But I really can't realize it yet. Feel as if I wanted tangible proof.' 'If you were any other young man,' retorts Minnie, 'I should consider that last remark of yours a paltry excuse to squeeze my hand.' They break into soft laughter. One laughs easily when cares are none, a pretty woman near—or bel homme, as the case may be—and dinner just over. Jim stretches out his hand. 'Give a paw, little woman!' as from one in authority."

The style of the author is a strange jumble of French, English, and an occasional dash of German, as for instance we learn of Min that "all at once, *sans rime ni raison*, she bursts into tears"; and again, "that she sits down sobbing, *pour tout de bon*"; the personal pronouns are generally left out altogether, and the verbs whenever it is possible, somewhat in the manner of the celebrated Mr. Alfred Jingle. In the end Jim marries Min; but "Regy," as the author would say, gives him a pretty hard run for it, and they come out almost neck-and-neck. We cannot recommend 'Ward or Wife?' to any class of readers. The thoughtful will find it empty, the polite will find it vulgar, the hopeful will be made despondent by it, and the despondent will be rendered morose; while by the simple device of avoiding the perusal of it, all these consequences may be avoided.

'The Law and the Lady' is one of those stories which could by no possibility have been written by any one but Mr. Wilkie Collins. It does not need his name on the title-page to make the authorship recognized. The central point of interest in it is naturally enough a crime—the murder, in this case, of a woman, which has happened before the story begins; and the novel consists of the efforts, finally successful, made by the heroine to discover the true criminal, and thus clear the suspected murderer—her husband. This gentleman has not merely been suspected of the crime; he has been tried for it; and the proof was so strong that had it not been for the wisdom of the Scotch law, and the necessities of the story, he would probably have been hung for it. But fortunately the jury returned a verdict of "not proven," and thus opened a way for the wonderful perplexities which ensue. The hero changes his name, and retires to the country, where he meets his second wife. He is evidently under a cloud of some sort; and as the reader has not yet been made acquainted with his previous history, he feels immediately confident that if a crime has been committed, he and the hero know perfectly well who committed it. This conviction is no sooner formed, however, than it is shaken by intimations thrown out by the author pointing to the unfortunate man's innocence. Meantime he is married to the heroine, and an *éclaircissement* has taken place, with no other effect than to prove the steadfastness and love of his new wife, who at once resolves to devote her life to freeing her husband's reputation from the odious suspicion attaching to it. The characters now begin to increase in number rapidly, and the reader's suspicion begins to fasten itself upon the mother of the hero, but soon changes its object after being made aware of the history of the murder-trial and the evidence given, and finds a new one in a certain Mrs. Beauly, a sort of rival of the hero's first wife. Need it be said to any one who knows the devious paths trod by Mr. Collins that it is neither Mrs. Beauly, nor the hero, nor the hero's mother (nor a servant either, who at one point seems to have a chance of turning out the criminal), but another person, no other than the first wife herself, who has been led to suicide by the atrocious conduct of the villain of the plot, an extraordinary monster in half-human shape named Miserrimus Dexter, who throughout the story has been kindly assisting the second wife in unravelling the mystery? The key to the mystery, by the way—we mention it for the benefit of writers of fiction—is an old letter torn into little bits, thrown with other refuse into an ash-heap at the time of the suicide, and there lying till the hour has struck and the man has come who is to give orders to have the heap sifted and the lost document reconstructed. Mr. Collins's ingenuity in the construction of his plots is very great. He reminds one of an older school of fiction in the steadiness with which he trusts to the unfailing love of a "story," particularly a story of crime, common to all mankind. The volume called 'Alicia Warlock' is a collection of short stories by the same author; but to our taste Mr. Collins's long stories are preferable to his tales, chiefly for the reason that his ingenuity in the development and unravelling of a plot cannot be well displayed in a short compass.

'Playing the Mischief' is a story of Washington life. The person who plays the mischief is one Mrs. Josephine Murray, a young widow, who is described as being very interesting to all kinds of men, but not so pleasing to those of her own sex. We can for ourselves deny feeling the slightest interest in her, for the simple reason that she is a lying, thievish, and totally heartless little jade, without the faintest vestige of a moral nature. The other characters in the story are mostly corrupt Congressmen (she herself is a skilful corruptionist with a claim on Congress that has been paid once in full), who fall in love with her. As the history of a fraudulent claim successfully carried through Congress, the book does well enough, though the barefaced candor with which the conspirators talk their fraudulent designs over with one another is, we should say, improbable even in these days. There is, no doubt, a great deal of corruption in Washington, and many a Congressman may have been influenced in his official acts by the passion of love, but people who wish to influence him corruptly usually try to induce him to think his interest and his duty to his country coincide. If we took Mr. De Forest's picture for absolute verity, there would be nothing surprising in members openly "selling out" to one another, and making their own bribery and subornation of perjury and other daily crimes the subject of unreserved conversation. Mr. De Forest has a great deal of cleverness, but he overdoes his "realism."

Christian Reid is a voluminous author. We have not read all her books—we take it for granted that they are written by a woman—but there are among them some of a particular kind, absolutely *sui generis*, which deserve notice. They are specimens of what may be called the Southern novel, and of them 'A Question of Honor' is an example. The Southern novel, if a new school of fiction, with its home in the South, is to spring up, must to a certain extent be founded upon the model of this book, for it describes a sort of life, with characteristics, ideas, traditions, hopes, and feelings, evidently sprung from the soil. In 'A Question of Honor' we have the love-affair of half-a-dozen of the younger members of two or three Southern families; one of them an old but proud and honorable line. They are all engaged to one another, or about to be, when the story begins, but as it goes on the engagements fall to pieces, and new ones are formed in the most surprising way. In the end there are one or two marriages, and the death of one of the young ladies of the story, which is necessary to render one of the marriages possible, takes place. In all this there is nothing very different from any ordinary novel, but still the atmosphere of it all is Southern. We cannot help feeling that we are in the midst of a society quite different from any to be found in any other part of the country. It is not the new South, with carpet-baggers and fraudulent bonds and progress, but the old South, lasting over with its broken fortunes into the new. There are the Severns, an old Southern family, such as we used to know and like before the war, making a manly struggle to put themselves on their feet once more; they fought gallantly for the "Lost Cause," and they were beaten; they must put their shoulder to the wheel, and retrieve their sunken fortunes. Perhaps what gives the peculiarly Southern coloring to the book is, more than any one thing, the extraordinary statements made by the male characters about their own and their family's honor, the excessive politeness of everybody, and the old-fashioned compliments which the men pay to the women. To people accustomed to Northern manners, where compliments are almost out of date, studied politeness is generally suspected of being a hypocritical cover for bad designs of some sort, and all allusions to "honor," one's own or anybody else's, carefully avoided, for the very good reason that the old practice of defending it at twelve paces has died out, all these echoes of the past seem very strange. Christian Reid's people are like people in a dream, and, although no mention is made of it in the book, we cannot help feeling that the manners described bear something the same relation to the romantic model which they dimly imitate that the modern Southern "tournament," with its "knights" and "queens of love and

beauty," do to the celebrated feats of arms at Ashby-de la-Zouch. We cannot help wondering either whether the war has really left in the South as much of the old "chivalry" as Christian Reid would have us believe, or whether the Scotts and Parkers have not quite wiped it out.

We knew Mrs. Elliot as the author of that rather flippant and untrustworthy book, the 'Diary of an Idle Woman in Italy,' and yet we opened 'The Italians' with tolerable hopes of entertainment. But Mrs. Elliot seems to us a mistress of the art of disappointing one. Her former work, in spite of its particularly pleasing title, was singularly unamiable and unsympathetic; it made the reader wonder that a person who cared to be at pains to write two volumes about Italian things, should not have a finer sense and a more delicate touch. Mrs. Elliot evidently knows Italy fairly well in a superficial way, and has had some observation of provincial Italian society, but she does not seem to us to have risen to the level of her opportunities. It is as if she had come to know Italy against her will and not from ardent choice, and had accepted her subject half in grumbling. The scene of her story is the picturesque town of Lucca, into certain of whose social mysteries she appears to have been initiated. We confess that we read her novel for the sake of Lucca, its beautiful cathedral and its grassy bastions, rather than for that of the author's own style. Italian scenery and manners have come to be a rather threadbare resource in romance; but we confess to a sneaking kindness for the well-worn theme, and our curiosity would have abundantly found its account in a story with the real savor of the Lucchese soil. In what Mrs. Elliot has undertaken to tell us, however, there is nothing especially characteristic, and no needful connection between her background and her intrigue. The latter is rather stale and tame. The young Count Nobili (of very new nobility) comes to live opposite a poor and proud old marchesa, the penultimate scion of a once glorious race. The ultimate scion is the marchesa's niece, a young girl with whom the count falls in love. The marchesa hates him for his wealth and his new-made prosperity, and takes away her niece to a castle in the Apennines. Here she falls asleep, one night, burning old papers, and sets fire to her niece's apartments. The niece seems likely to go the way of the papers, when the count turns up in a cloak and slouch hat and snatches her from the flames. After this he makes his own terms with the marchesa, and secures the hand of the niece on condition of liberating the estate from debt. There has been in the early part of the book a certain Count Marescotti—the "red count," as he is called—a fantastic radical of aristocratic birth, a deep-dyed Republican and sublimated Communist, who, though his character is but feebly sustained, makes the reader ask why he has come into the book and why he suddenly goes out of it. The author has gone to considerable expense to introduce him, but, once introduced, she drops him into outer darkness. His only visible *raison d'être* is that Count Nobili may suddenly declare that his own betrothed has been offered to Marescotti and refused by him, and that he therefore washes his hands of so dishonored a bride. He storms and rages and behaves very shabbily, and the sweet Enrica, his repudiated mistress, pines and droops in orthodox fashion. Nobili veers about, however, at the eleventh hour, and, to make up for his brutality, elopes with the young lady. The author has not succeeded in reconciling us to the ferocity of his sudden disaffection, and it would only be needful that we should have interested ourselves in the marchesa's niece to say it was a great shame he ever recovered her. The young girl, however, does not rise to the dignity of an object of interest. We can hardly say what the tale is meant to illustrate, unless it be the baleful effects of exaggerated family pride. The marchesa is possibly a study from life; unfortunately, she is a study that is not studied. The figure is drawn with coarse and angular strokes, and the impression that the author may have had some knowledge of an original only increases the reader's displeasure that she has not found it artistically more inspiring. As a collection of typical Italian portraits, the book makes some pretensions; the author has in especial a good deal to say about what she calls the "golden youth" of Lucca. We hardly know why she should so frequently reiterate this phrase, with its quotation-marks: "jeunesse dorée" is not Italian, and the young loungers of Italy are generally not at all "golden." At Lucca, particularly, one may lounge with pockets very scantily lined, and be withal a rather more interesting fellow than the members of the group sketched by Mrs. Elliot. Considering her own tone, the writer seems to us too scornful of Italian levity, and she has not taken the profitable way of dealing with the Lucchese gossips. On the one hand, her satire is not morally edifying, and, on the other, her imagination does no justice to the charming dramatic *bonhomie* of her models.

The 'Odd Trump' is a tale of love, adventure, and ghosts. It shows some cleverness, and seems to be written by an American who has lived a good deal in England, or, at any rate, is familiar with many peculiarities of English society. There are a good many characters, one of whom is an American, and he is better drawn on the whole than most Americans are apt to be in novels of English authorship. The hero is the old-fashioned hero of novels of a generation ago—a strong, brave, tender-hearted, and honest young man, who opens the ball by rescuing the heroine from a watery grave and closes it by marrying her. The "odd trump" is not a winning card held by one of the characters, but is the hero himself. We have seen better novels, and we have seen worse. We are always grateful to any rising literary man who does not fill us with a physical loathing, not merely of his own vulgarity but that of the world which he describes. The reader of the 'Odd Trump' will be spared this, and be perhaps surprised to find that it is possible for a novelist of nothing more than ordinary power to produce a work of fiction which shall have a plot, characters, and even interest, without any morbid appeals to a prurient taste for horrors, excesses, indelicacies, and adulteries. We do not mean to say that the 'Odd Trump' is a work of genius or is above the capacity of nine out of ten clever men or women, but it shows a cleverness which is above belittling itself by these mean arts.

'The Italians: A Novel. By Frances Elliot.' New York: D. Appleton & Co. 18.5.
'The Odd Trump. A Novel.' New York: E. F. Hale & Son. 1875.

*Nooks and Corners of the New England Coast.* By Samuel Adams Drake. (New York: Harper & Bros.)—Mr. Drake gives us good measure. His twenty-eight chapters, covering 450 ample pages, are crowded with description, narrative, and sentiment, and adorned with some three hundred wood-engravings of which it is only just praise to say that not one is trivial or superfluous. We will not maintain the accuracy of all the portraits or of the drawings of all the old houses, which are numerous; but the artistic portion of the work is, considering its intention and the judgment displayed in it, safe from any criticism of ours. The author's coast-line begins at Mt. Desert and ends at Saybrook, Conn. His several stations are selected for other reasons than those which determine the ordinary tourist, yet a large part of them are recognized watering-places, and at all of them the hot season might be pleasantly and profitably passed. On this account the travelling public will prize this as a guide-book of no ordinary merit. Wherever an antiquary would be tempted to land, Mr. Drake comes ashore; but twenty landings by no means exhaust a coast so rich in antiquities as that of New England, and Mr. Drake passes by a good many harbors in which his drag-net would have brought him an embarrassment of riches. He touches at York, but not at Portsmouth; at Salem, but not at Newburyport; at Marblehead, but not at Lynn; at Castine, but not at Machias; while that delightful "corner" of New England, the real angle of "Down East," Eastport, is likewise omitted—let us hope for a second volume like the present.

For a literary workman, Mr. Drake lacks self-restraint. He is too prodigal of his historic lore, and too much inclined to make a pretext for lugging some quite irrelevant fact or personage on to the already overpeopled stage. An example of this occurs on p. 217, where Mr. Drake has occasion to tell of General Putnam's having kept a tavern in 1768. He immediately adds: "Another famous soldier, Murat, was the son of an *aubergiste*, and Napoleon was not too willing on that account to give him the hand of his sister." But Putnam was not an innkeeper's son, and the allusion to Murat seems to find its motive either in a little pedantry or in a desire to fill out a rather scanty paragraph. Another fault which we will indicate is a too positive and peremptory expression of opinion concerning men and events not yet beyond controversy. As a sentimental tourist, Mr. Drake is entitled to offer us his glasses, but, as an historian, modesty should induce him not to force his views upon his readers. With these exceptions, we can only congratulate him on having produced a very useful and entertaining work, which ought to be long in demand.

## The Week.

MR. WILLIAM WELSH, of Philadelphia, a well-known merchant, and a former member of the Indian Commission, has been writing a very unpleasant letter to the President about Secretary Delano. It will be remembered that two distinct lines of defence were adopted by the Indian Bureau when the charges of fraud began to be made against them—that is, Commissioner Smith fell back on his Christian character, and Mr. Delano tried to discredit his assailants. In a moment of fatuity, the latter tried to pooh-pooh Professor Marsh by calling him "a Mr. Marsh," and since then he has brought charges of by-gone drunkenness against Mr. Walker, the confidential clerk of the first Board of Commissioners, who first drew attention to a few frauds. Mr. Welsh now takes up Mr. Walker's defence, and talks in a licentious and unbridled manner about the worthy Delano. In the first place, he bears the strongest testimony to Mr. Walker's character, and to the accuracy of his charges, and then says the attack on him is a malicious libel got up by Secretary Delano and his Assistant Secretary Cowen. He then hints that the President would have done well to let Delano go when charges were first made against him, and that he was kept in and "allowed to leave his Department in charge of subordinates for months together that he might canvass the country and secure his [Grant's] re-election to the Presidency," and he demands that the papers in his (Welsh's) possession shall be examined by some of the President's friends in Philadelphia, to see whether Messrs. Cowen and Delano have not been guilty of a criminal libel. In fact, it is evident not only that Mr. Welsh "feels unkindly" towards Mr. Delano, and thinks meanly of him, but that Mr. Delano would, if he were not "under fire," be in great danger of removal. Mr. Cowen has undertaken to reply to Mr. Welsh's charges, the gist of his argument being that Mr. Welsh has, down to the present time, denied having any knowledge of Indian frauds, or, in other words, that he has "slept on" the matter too long for us to believe him now, and is, in fact, a thorough scoundrel and falsifier, engaged in a damnable conspiracy to blacken the character of men who have never wronged him.

Exactly what the functions and prerogatives of the mysterious body known as the Grand Army of the Republic are, no one knows perhaps but the members, but one of them appears to be that of preventing the ex-President of the Southern Confederacy from making himself too conspicuous. A committee of Western Grangers at Rockford, Illinois, asked Mr. Davis to deliver the annual address at the Fair of the Winnebago County Agricultural Society, whereupon the Grand Army of the Republic—the local representatives of it—held a meeting, and resolved that they regretted the invitation had been given; that they looked upon it as an insult to ask the "arch-traitor" to address the relatives and surviving friends of 13,000 men "murdered at Andersonville alone by his orders"; that they protested against the whole proceeding, and pledged themselves not to help or forward it in any way. We must say that we cannot see what possible pleasure any Northern community which suffered heavily during the rebellion can have in listening to a lecture on agriculture from Jefferson Davis, though, if we were obliged to hear him, we should rather hear him treat agricultural topics than such a matter, for instance, as constitutional law or the pardoning power or prison reform; but, of course, it is a matter of taste to be decided by each locality for itself. On one account, however, we regret that the lecture to the Winnebago Grangers did not come off. The address would naturally have dealt mainly with the elevation of labor and certain questions connected with capital, and the suggestions of the ex-President of the Southern Confederacy on one, and the advice of a Mississippi repudiator on the other, delivered to the Honest Farmer intent upon swindling his creditors, would have been an entertaining, if not an instructive, address.

The week has brought nothing of unusual importance in the business world. As was expected, the Bank of England reduced its minimum discount rate to 2 per cent, and discounts have been obtainable elsewhere in London at 1½ per cent. With the decline in what may be called the official rate for money in London, there has been a sharp advance in securities, British consols leading, and selling at higher prices than at any time during the past fifteen years. American securities have also been in larger demand, as is proved by the sales of the U. S. new five per cents, which have been sufficiently large to enable the Syndicate to request the Treasury to issue a call for another $10,000,000 of the 6 per cent 5.20's. At the New York Stock Exchange there has been an absence of speculation, but prices have generally advanced, the most conspicuous instances having been furnished by the stocks of the railroads north and west of Chicago and of the Western Union Telegraph Company. In respect to the latter, it is understood that a reconciliation has been effected with its rival, the Atlantic and Pacific. On Monday each of these companies restored rates to what they were before the "war" which broke out last spring. The money market has been very easy, and rates have not yet responded to the improved enquiry from the merchants for bank accommodations. The crop advices have been that previous accounts of damage have been exaggerated; accordingly, prices have declined for all the most important staples. The price of gold and the rates for sterling exchange have fallen on account of the rise in and enlarged demand from Europe for American securities, and also because the time is drawing near for the exports of cotton to begin.

The detailed statement of the assets and liabilities of the firm of Duncan, Sherman & Co. appeared on Tuesday; it showed total liabilities of $4,910,013, with total assets of $2,119,368, the latter including $264,800 individual property of the partners. Of the liabilities, $1,210,000 consisted of the unsecured paper of the firm, and $2,230,314 due depositors. It turns out that the largest depositor had a balance with the firm of $345,639 12, and that there were but two others whose balance exceeded $100,000. The securities of the firm are given at $567,470, and this while many of them are assigned only a nominal value, some being put in at a cent on the dollar. It is noticeable that, for a banking-house of excellent credit before the failure, the greater part of the securities are of that peculiar kind shunned by prudent people. Altogether, however, the official statement shows that the affairs of the firm were in better condition than feared, and the publication was undoubtedly a relief to many who were prepared for a much worse exhibit. Mr. William Butler Duncan has issued a card to the creditors of the house, proposing a settlement at 33⅓ per cent. He offers his notes for this amount, payable in five different instalments, the last of them in 1877, on the understanding that, should the assets produce more than 33⅓ per cent., the surplus also is to be divided pro rata.

We observe among the suggestions sent to the newspapers apropos of the inconvenience caused to Americans travelling abroad by the failure of Messrs. Duncan & Sherman, that the circular notes given to travellers by banking-houses ought to be guaranteed by the Government on the same terms and in the same manner as the bills of national banks are now guaranteed. This is a fresh and striking illustration, though a small one, of the growing readiness of the present generation of Americans whenever they get into trouble of any kind to fly to the Treasury for relief. If the

Government were to guarantee travellers' credits, it ought not to stop there. It ought to see that their baggage is properly shipped, that they are lodged in foreign cities in salubrious quarters, that they deal at the best stores, and that their children are sent to the right schools. It ought to see, above all, that American heiresses are not cheated by foreign husbands, and it is questionable whether it ought not, in case of exceptionably brilliant matches by poor American girls, to supply the trousseau. Ought there not, too, to be Government couriers appointed by the Custom-house to take American travellers over the Continent, and help them in their shopping? Perhaps the day will come, after the inflationists get into power, when Americans abroad will be able to draw direct on the Treasury Department for whatever funds they need, on having their nationality attested on the draft by the consul. That we are not so very far from this is shown by the suggestion of the Cincinnati *Enquirer*, that the Government should "stop collecting taxes for a few months," and pay its expenses in paper-money of its own manufacture. But, as the Boston *Advertiser* pertinently asks, why for a few months only? Why not for a few years? And why its own expenses only, we ask? Why not the expenses of all good men and women? Why should we all toil and moil when the Treasury could, if it pleased, foot our bills without loss to anybody?

---

Mr. Tilden has been making a sort of progress through the State, addressing crowds in the towns through which he passed on the subject of reform. He has spoken very plainly about it, and told his audiences that what he means by reform is not electing "straight-out" Democrats nor Jeffersonian Democrats, not "rallying" nor "wheeling into line," nor even hurling the corrupt centralizer from power, but the election of honest men of whatever party to do the work of the Government. His remarks seem to have struck the assembled multitudes very favorably, and it would appear from their manifestations of approval that this is just the sort of thing they mean by reform themselves. In fact, with a politician of Mr. Tilden's cautious temper and perhaps over-willingness to follow a popular lead, rather than take the initiative himself, it may safely be assumed that he would never have bid such open defiance to the party yoke if he believed at bottom that it was weighing very heavily on the public neck. The press, instead of following their usual custom of opening the floodgates of calumny upon Mr. Tilden—and thus (we may observe incidentally) deterring our purest and best men from entering the political arena—have applauded him, and pointed him out as one man in public life at least deserving popular support. The *Times*, however, which is sometimes inclined to set up a too lofty standard for our public men, criticises Mr. Tilden as not being quite whole-souled enough a reformer. It is impossible to forget, the *Times* says, that Mr. Tilden was a prominent Democratic politician during the whole Tweed period, and declares that he must have been "privy to many of the worst acts of Tweed and Sweeny." The "worst acts" of Tweed and Sweeny were stealing, ballot-stuffing, and perjury, with an occasional connivance, it may be, at murder; so that Mr. Tilden must be a pretty abandoned old villain to come out as a Canal Reformer. And yet, strange to say, he seems to win the confidence of the masses more than Murphy, Bliss, Davenport, Gardner, Conkling, or even Havemeyer did.

---

A body known to itself as the Legal-Tender Club is going to hold a meeting at the Cooper Institute on or about the 1st of next month to fire the hearts of the inflationists. The club declares itself in favor of a "United States Legal-Tender Sound Currency, based on the faith and credit of the people of the United States and their General Government, and also on the revenues paid by the people to the United States Treasury, and having in addition a representative value in being redeemable and interchangeable for 3.65 United States bonds." The club have invited General Butler to address it, and he has written a letter in reply, expressing his sympathy with the objects of the club. He says that "how the country is to grow rich enough to pay its debts by the non-production of its able-bodied workers" is something which he cannot understand. Two millions of people, it seems, are now out of work, and, estimating the value of their labor at the low rate of two dollars a day, we find that we have lost—or they, or some one else has lost—in the past year no less than $1,200,000,000 by their enforced idleness, to say nothing of "the loss of the morale" of the working men and women, which we should say it was safe to estimate at three dollars a head, for both sexes, making in all $3,000,000,000. No wonder, as General Butler says, that the docks of New York are deserted, her stores unrented, and her dwelling-houses "so depreciated as hardly to meet the mortgages upon them." We are glad to see that the club is not going to stand this sort of thing any longer. As the Secretary of the organization well says, "who would be free, himself must strike the blow."

---

Mr. Plimsoll appeared in his place in the House of Commons on the day to which the debate on the motion to censure him had been adjourned, and made a full and frank apology. Whereupon Mr. Disraeli abandoned his motion, and everybody seemed satisfied except Mr. Bentinck, who called attention to the fact that Mr. Plimsoll had not withdrawn his charges against Mr. Bates, and suggested that there ought to be a Committee of Enquiry. The Government has passed a bill dealing with the unseaworthy ships, which substantially gives an officer of the Board of Trade at each port the power of stopping a ship from going to sea, and an examination of any ship is to be made on a demand of a certain proportion of the crew. Mr. Plimsoll's own scheme provided for the minute supervision of the shipping business at every stage in a ship's history—when she was built, altered, or repaired, and every time she sailed. This would not have worked, and it is doubtful whether the Government bill will work well either, but then the crime it deals with is committed by a small class and ought not to be difficult to suppress. The effect on Mr. Plimsoll's popularity has been wonderful. His tirade elicited a burst of applause from one end of the kingdom to the other, and brought him so many testimonials that he has been compelled to acknowledge their receipt through the *Times*. The restrained and sober way in which the House of Commons dealt with the affair showed that it had a premonition of the effect it would have on the country at large, as well as a strong sense of its own dignity.

---

The question whether a Wesleyan minister has the right to put "Rev." before his name on his daughter's tombstone in a parish churchyard, has been decided on appeal, after an elaborate argument, by the Dean of the Arches, Sir Robert Phillimore, the father of the Chancellor of the Diocese in which the case arose, who had already passed upon it. The son decided against the minister, as our readers may remember, on the ground that Mr. Keet, as a Wesleyan, was not "worthy of reverence," and that if he were allowed to call himself "reverend" on a tombstone, it might be the means of disseminating false doctrine. The father does not take this solemn view of the matter, but he reaches the same conclusion as the son, viz., that the vicar's discretion cannot be interfered with, inasmuch as the graveyard is the rector's freehold, and he can do what he pleases in it, and might even pasture his sheep in it. We presume he might also disinter the bodies and put them elsewhere. The case grows more ridiculous the farther up it goes. At the next step, however, it comes before the Judicial Committee of the Privy Council, which is not an ecclesiastical court, though it has jurisdiction of ecclesiastical causes, and may, and it is hoped will, put an end to this scandalous absurdity. The extent to which the fair fame of the Church of England and its hold on popular respect and affection may be put in peril by the action of a single cantankerous or ill-conditioned minister, is well illustrated both by this and the Jenkins case.

The conviction of Colonel Baker for an assault upon a young lady in an English railway carriage has been the occasion of a good deal of moralizing in some of the newspapers on the difference between justice as administered in our courts and in the English tribunals. This is apropos of course of a supposed failure of justice in the Beecher case; but it seems needless to point out that the analogy between the two cases consists solely in their both being cases at law, tried in court by judge and jury. There is no other resemblance. An offence like that committed by Colonel Baker, had it occurred in this country, would probably have been far more heavily punished than in England, as it is notorious that juries always like to find verdicts where a woman is the plaintiff or prosecutrix. The theory that in such a case the social standing of the defendant would screen him in any civilized court is untenable. The implication, too, that the Beecher case was an indictment for assault is slightly inaccurate and libellous. The law and penology of some of the newspapers seem a little defective, and there is so much crime of one kind and another going on which needs discussion and exposition that this is to be regretted. In the establishment of new schools of journalism, the need of chairs of penology and law ought not to be overlooked.

---

The flight of Alexander Collie has prevented the submission to the English courts of some interesting points of trade usage. The case of the Bank against the firm was that its bills were not only "accommodation bills," professing, as all bills do, to have been given for "value received," but had certain letters or marks, which were intended to produce the impression that they not only referred to a sale of some kind, but to a sale of particular goods which would be available for the payment of the bill. There was no denying the existence of the letters and marks, but the defendants' counsel contended that they did not necessarily bear the construction put on them by the prosecution; that they were not unfrequently used without any reference whatever to goods; and he produced one example where the letters were merely the initials of the drawer, or acceptor of the bill, and had actually summoned members of six or eight leading firms as witnesses in support of his position, when his client fled, and he retired from the case. There appears, if one may judge from the discussions in the London papers, to be no settled opinion about the matter, or, in other words, it seems as if there was some trade custom in that city which made the legality of these marks at least uncertain. The flight of Alexander Collie proves no more than that his transactions have been doubtful and that his nerves are weak.

---

The unfortunate British bondholder is again laying his griefs before the civilized world. The Committee of the House of Commons appointed some months ago to investigate the manner in which swindling republics like Honduras, San Domingo, and Costa Rica managed to borrow large sums of money in the London market, has just made its report, and it is certainly an entertaining document, and ought to be issued as a volume for "summer reading." The Honduras Loan is a specimen case. The principal person engaged in carrying it out was Don Carlos Gutierrez, the Minister of the Republic at the Court of St. James, who appears to be a great operator, and cheated in a great variety of ways, and employed as his principal assistant a man named Lefevre, who had been condemned by default in Paris to two years' imprisonment for breach of trust. The two employed Messrs. Bischoffsheim & Goldschmidt as their brokers to put their loans on the market. The subsequent operations were of the most extraordinary character, and included every variety of stock-jobbing frauds, and ended in the disappearance of most of the money raised. It must be remembered that Honduras, when they began raising loans, had no credit whatever and hardly any resources, and was inhabited by a small population, which hardly knows what credit means. In 1867, the Republic owed in all about $600,000, of which it was able to pay neither principal nor interest, having been in default in both for a long period. Gutierrez and his confederates then went to work, and, by an elaborate system of false pretences, lies, and stock-jobbing, between the years 1867-70 ran the Republic in debt for over $30,000,000 by the sale of bonds at about 80; but of this sum only about $3,500,000 reached the Government in cash, and this went to pay the contractors who made fifty-three miles of an uncompleted railroad. The only other return was the cancellation of bonds amounting in nominal value to about $3,500,000 more. The rest of the debt has disappeared, but both Lefevre and Don Carlos refused to appear before the Committee. The bonds now outstanding are, we need hardly say, worthless, and the only course open to the holders is to raise a filibustering party, conquer the Republic, and "base" their securities on "the entire wealth of the people."

---

The French Minister of Public Works, M. Cailloux, has made before the Committee on the Budget an estimate of the damage done by the floods in the South of France, in which he sets it down at over $15,000,000, which is a very large reduction from the earlier estimates, which reached in some cases $100,000,000. The exaggeration which marks these estimates in case of all great fires and inundations is a natural result of the tremendous impression they make on the imagination. The Assembly continues to work away at the details of the new constitution, and particularly the regulation of the election of senators, and in voting the various appropriations. M. Buffet announces that the state of siege will be kept up until a new press law, which will not be ready until the Assembly meets again, has been passed—probably one of the strongest acknowledgments of the influence of the press ever made in France. There is no change worthy of note in the relations of parties. There are still rumors of troubles with Germany arising out of German jealousy of the French armaments, but they seem to have no foundation.

---

In Germany there are signs of a break in the Ultramontane resistance, for two of the bishops have expressed their willingness to submit to the law for the administration of ecclesiastical property, but it is denied that there is any likelihood of joint action on the subject. It is generally supposed now that permission has been given from Rome for each bishop to decide for himself to submit or not. On the other hand, the Ultramontanes have carried the day in the Bavarian elections, and will have a majority of two in the new Chamber.

---

That there is an insurrection of greater or less dimensions in Herzegovina, and that there has been some fighting, appear to be certain; but whether the movement is making any progress, or is likely to become serious, it would be difficult to say. All troubles occurring in Bosnia or Herzegovina are certain to be magnified, owing to the wildness and remoteness of the provinces, and the hatred of the Turks felt by the majority of the population and by their neighbors over the Austrian border. Skirmishes are magnified into battles, and the Turkish losses represented as very great, on the smallest possible ground of facts. The origin of the present disturbance is probably to be found in the tax-gathering, and whether it will become serious or not will depend on the amount of assistance the insurgents can get from Austrian territory, and this again will depend on the amount of zeal Austria puts into measures of prevention.

---

The condition of affairs in the North of Spain appears again to be very uncertain. The Carlist Committee in London pronounces the late reports of Alfonsist successes untrue, and it is acknowledged by the Alfonsists that there was no foundation for the story that Dorregaray had retired across the French frontier. The Carlist version is that two hundred of his men, who were left behind to burn the ferry-boats on the Ebro, had been driven into France, but this was expected, and that the Carlist losses during the past month have been trifling. The game of recrimination about cruelty is still kept up on both sides, and Don Carlos has written to his cousin remonstrating with him on the brutality of his troops, and expressing unbounded confidence in his own ultimate triumph. The new constitution as a whole has been adopted by the committee appointed to draft it.

## THE CONTEST OVER THE CURRENCY.

AN Ohio correspondent, in another column, puts together some facts which are just now worth noting because they have a good deal of bearing on the fate of the currency question. That question is again coming up, and is again assuming a threatening aspect and exerting a depressing influence on the business of the country, mainly because the party in power for the last fifteen years has either avoided dealing with it at all, or has only dealt with it in a half-hearted and insincere way. It is dealing with it now in a half-hearted and insincere way. The bill of January, 1875, was avowedly not a final settlement, but a compromise intended to put off final settlement to a more convenient season. We drew attention at the time to the way in which Senator Sherman fenced with the questions put him by Mr. Schurz as to the real meaning of the act. Our correspondent draws attention to the way in which he is explaining it away in Ohio. From the account he gives of it there, people are led to believe that it is a mere form, and will have no effect whatever, or, in other words, that the present state of things is neither dangerous nor undesirable. And Senator Morton's speech shows clearly that the Republican chiefs do not wish to "go before the people" on the currency question, and have nothing very positive to say about it. What they prefer to speak about and legislate about is the "outrage" question. They have ten words to offer about apocryphal murders at the South for one about financial reform.

What has been done to inform public opinion on financial questions has been done almost entirely by the newspapers; but then, excellent as much of the work done by the newspapers has been, it cannot have, and has not had, the effect which plain and earnest speaking by the party leaders would have had. People in forming their judgments about public questions are apt to be a good deal influenced by the consideration of what must and will be done, as well as by the consideration of what ought to be done; and about the former, party managers are naturally supposed to know more than the editors know. When the party chiefs, therefore, kept on persistently shirking or evading the currency question after the war, good Republicans naturally got into the way of thinking that it might be shirked or evaded indefinitely, and of regarding the newspaper articles about the currency as good essays containing sound principles which some day or other the country might have to put in practice; but what most needed to be done at this particular moment "practical men" like Messrs. Sherman, or Boutwell, or Conkling were supposed to know best.

The result of this state of things is that the Republican party has remained, down to this moment, without any definite policy on the currency question, and that those who speak for it officially have always spoken about the public debt in an uncertain way. When Congress first authorized Secretary McCulloch to contract, it did so in carelessness or ignorance of what it was doing, for, as soon as its attention was strongly directed to the matter, it withdrew the authority. When the first outcry against the bondholders was raised in 1867-8, and the talk of paying them off in greenbacks began to be heard, instead of boldly stemming the tide and speaking out in defence of common honesty and national honor, Senator Sherman introduced a most discreditable bill, intended to "scale" the public debt by compelling the bondholders to accept a five per cent. for a six per cent. bond, without the option of being paid off, and advised the bondholders as a friend to submit to the fraud, lest a worse thing should overtake them. So, also, when the question came up of the precise position and character of the $44,000,000 withdrawn by Mr. McCulloch, the majority refused to make any legislative utterance on the subject, and allowed the bold Boutwell to settle the matter in his own way. Had the panic not occurred this do-nothing policy upon the most important question of the day would probably have been persisted in, and the attention of the party managers have been concentrated steadily on the manipulation of the South. The frantic manufacture of outrages, through the machinery of the Department of Justice and otherwise, which we witnessed last fall, was unquestionably a desperate attempt to escape the pressure of the financial problem; and the bill of last January was, as we now see more clearly from Mr. Sherman's account of it, a piece of mystification. It is, he says, paper for the soft-money men and gold for the hard-money men. "You pays your money and you takes your choice." As regards the Republican party, its own desire is to please everybody—both the contractionist and inflationist, the solvent and insolvent, the creditor and the debtor, the lazy and the industrious; but a policy of this sort is not likely to carry us very rapidly towards specie payment. The Ohio voter may very well ask Senator Sherman now why the Treasury has accumulated gold, inasmuch as it is not going to redeem, and what need there is for redemption when the greenbacks are in any event sure to stay afloat.

That the Democrats, on the other hand, have no really sound financial traditions, and have never received any sound or thorough financial instruction, is equally certain. When the party last took up the currency question it approached it wholly from the political side. Its hostility to paper money was hostility to the money of monopolist banks. A thorough discussion of the evils and dangers of all paper money by whomsoever issued has never taken place in its ranks, so that "soft money" issued by "the people" is a new thing to it and by no means repulsive. Approaching the subject again from the political side, it sees much in "people's money" to commend it. It is issued not by "grasping speculators" and "heartless monopolists," but "by the people, through the people, for the people." It is printed on the people's press and scattered abroad by the people's officers. When issued plentifully, it is sure to raise not the prices of a few things but the prices of everything, and is thus a thoroughly democratic money. Moreover, it cannot, like gold and silver, be melted down and carried off by foreign speculators. It stays at home and circulates only through American hands. In fact, it has, considered politically, every quality that "the poor man" can desire, and there is nothing in the history of the Democratic party to lead a good Democrat to distrust it. Moreover, its constitutionality in time of peace is not so serious a difficulty for Democrats as some Republican orators would fain believe. It was the general opinion of lawyers and politicians down to 1861 that the United States had no power to make anything but gold and silver a legal tender in payment of debts or to issue paper for compulsory circulation. The Republican party got over this difficulty by the assumption of "the war power," or, in other words, by the aid of the theory that in times of great national peril whatever was necessary to the national safety might be done without regard to constitutional prohibitions. Now, the Democrats may very well say, and do say, that the term "war power" ought to be construed in a large and liberal sense; that the danger against which it is intended to guard need not necessarily be danger from armed attack or invasion, but any danger threatening the mass of the citizens with distress and suffering; and that the panic has brought us face to face with such a danger—a fact which the President and Mr. Richardson partially recognized when they began issuing the $44,000,000 in 1873 for reasons of state. Moreover, although the Supreme Court may pronounce the issue unconstitutional except in time of war, a Republican Administration has shown that a decision of the Supreme Court is only binding until the Court can be reorganized or enlarged. In fact, it is painful and alarming to recall the number of Republican devices produced during the last fifteen years which may now return to plague the inventors.

The way to get out of the scrape is to drop the policy of subterfuge and evasion and tell the honest truth and stick to it, or, in other words, "trust the people," as Mr. Boutwell would say. No amount of lying and quibbling will ever get us back to specie payment, nor will the supply of murders at the South last long enough to save the party from taking some solid ground on this question. All the negroes might be slaughtered without solving or helping to solve the problem. There is one thing, too, very certain, and that is, that the Presidential campaign cannot be carried on next year on the

Southern issue. It will inevitably be conducted largely on the financial issue; whether it result in the triumph of the policy of inflation or of the policy of evasion, the effect on business will be equally disastrous. The country has gone as far as it can go on the Republican plan of dodging and postponing. We have very distinctly reached a crisis, at which we must select one of two plain courses. A decision in favor of resumption, without falsehood or reservation, would launch the country on another magnificent run of prosperity; a decision in favor of inflation, or of inflation that will be the same thing as contraction, or contraction that will be the same thing as inflation, will certainly bring about one of the most tremendous financial catastrophes ever witnessed, for no commercial state of the magnitude and importance of the American Union has ever either gone into bankruptcy or attempted wholesale issues of irredeemable paper in time of profound peace. The seizure of the Government by the inflationists would in fact mean, and be taken to mean, that, for the first time since the fall of the Roman Empire, the affairs of a vast, highly-organized society had passed into the hands of its most ignorant and unscrupulous class; and an occurrence of this sort in our day would give a shock to civilization itself.

## THE PLIMSOLL INCIDENT.

IT seems to be the fate of the English Conservatives of late years to stimulate radical tendencies a good deal more than the Liberals could or would. In fact, their main function in English politics has recently been the precipitation of schemes which the Liberals were only talking of in a half-hearted way, and their very blunders seem to serve this purpose as well as their preconcerted strategy. At the bottom of their promotion of radical ideas is the belief that their putting on more coal will secure them the control of the engine. It was this belief which led them to carry into execution the radical plan for the extension of the franchise in 1867, and which is now leading them to flirt with the female suffragists. The party is suffering seriously in the House of Commons, as the English papers are beginning to point out, from the Premier's want of business capacity, combined with the delicacy of his health and his advanced age; and, curiously enough, this serious weakness has unexpectedly, in the Plimsoll case, lent powerful support to a state of public feeling which any party calling itself really conservative ought to view with horror. Ever since the Dundee election, when Mr. Edward Jenkins was elected by a heavy majority over Mr. Fitzjames Stephen, the new constituencies, or, rather, additions made to the old constituencies by the late Reform Acts, have been causing English politicians considerable anxiety. The election of Mr. Jenkins was followed by that of Dr. Kenealy, and there is constant expectation of others of a similar character. Mr. Jenkins was elected because he had written a novelette containing a caricatured biography of a young pauper, and Kenealy because he had been counsel for a butcher who had been clearly proved a fraudulent claimant of a baronetcy. Both candidates, too, were elected without the slightest reference to party ends or traditions, or to current political questions, and, in fact, their success had all the air of being the result of a sudden freak. If one judges the new constituencies from such occurrences, one can hardly avoid feeling that if about the time of a general election the voters of the boroughs were seized with any great delusion, they might, under its influence, send up to the House of Commons a sufficient number of adventurers and fanatics to place the Government in great peril or difficulty; and the history of the Tichborne affair shows that no foresight or sagacity would be sufficient to put politicians on their guard and enable them to adopt measures of prevention. The rise of Orton the butcher into a popular hero has been as unaccountable as that of many of the Arab or Indian prophets, and the election of Kenealy as a means of helping him and vindicating the cause of justice, has also a flavor of Oriental extravagance and absurdity about it. But the striking characteristic of his election is that it is simply a means of giving expression to strong feeling on a particular point, and is, in no sense, a contribution to the general political work of the country. It is, in short, a process somewhat resembling the giving of three groans for the Court of Queen's Bench; and that the franchise should be used recklessly for such a purpose naturally causes more or less alarm even among people who are not timid.

Now, it is not difficult to see that the Plimsoll affair is likely to spread and strengthen, especially among the new voters, this excited and emotional way of using the franchise. Mr. Plimsoll is not a very wise man in the political sense of the word. He is a philanthropic enthusiast, whose imagination has been filled with one gross abuse, and who takes no account of difficulties in trying to remedy it. This sort of man does and has done great service in our day, but not in shaping or suggesting legislation. The bill which Mr. Plimsoll himself framed for preventing the use of unseaworthy ships was in so far absurd that it would have been impossible to execute it. Now, anything which makes such a man seem not only more humane, but more sagacious, than those who are regularly charged with the embodiment of ideas in legislation is, in the existing and probable condition of English constituencies, more or less dangerous; and yet this is exactly what has happened through the late scene in the House of Commons. Not only did the Government show itself indifferent to human suffering by its abandonment of the bill, but its subsequent surrender showed that its abandonment was foolish and unnecessary. This is not all, and not the worst, however. It was brought back to its duty, not by the parliamentary process of persuasion by argument, but by a violent, threatening, and disorderly harangue, from a person excited to the verge of insanity. Upon seeing him shake his fist in their faces, and set the Speaker at defiance, the Ministers actually changed their programme, and agreed to carry a bill which they had determined to throw overboard. This is the real truth of the matter. Mr. Plimsoll's apology was a mere form, the most marked effect of which was to heighten the triumph of his peculiar method of bringing the Ministry to terms. All England is delighted, too, and congratulations pour in on him from every quarter; and the lesson of the affair to the new voters is obvious, and most certainly will not be lost on them. It will not only heighten their respect for the Plimsoll type of man, which is not to be regretted, but it will increase their confidence in it for political uses, and will correspondingly diminish their confidence in the kind of politicians by which the English Government has thus far been conducted—the slow, cautious, careful, unemotional kind, which occupies itself fully as much with the possible indirect results of measures as with their intended or direct results. The chances of seats in the House for men like Mr. Plimsoll will be greatly increased, and the imaginations of young demagogues will be filled with visions of overthrowing the Cabinet by *coups de théâtre*.

Why the rise into power and credit of this class of politician would be unusually dangerous in England it is not difficult to explain. The first or main reason is that the constitution is simply a bundle of traditions, respect for which is a mere habit which the House of Commons might any day throw off. There is no organic law, as there is here, embodying the sober second thought of the country, a disregard of which would be revolutionary. A reckless or radical House of Commons would, therefore, be an engine of tremendous power, and especially of power of mischief, owing to the constitution of English society; for English society and the huge fabric of English credit rest almost entirely on the assumption that (in English politics) customs and traditions and vested interests and long-existing understandings will be respected, that no sudden or violent changes will be made and no rash experiments tried. English society is so complicated, and English credit so delicate a thing, and the variety of interests over which the Government has to watch in all parts of the world so great, that the slightest suspicion of revolutionary tendencies in the House of Commons would produce a panic such as the world has never seen. The social and political machinery there could not bear the jolting over rough roads which ours here has so often to undergo, and undergoes with impunity. The danger from the caprices of the new

constituencies will probably not disappear until they have been in some manner subjected to party rule, and trained to act under the orders of "managers"—a result which may not be very far off. What kind of party they will support, and what general policy they will take up, it would now be difficult to predict, because uncommonly little is known about them. Every writer has his own theory about "what the English workingman wants," and no two writers agree. But it may be taken for granted that his rule, if it is ever established, will have but little of the steadiness and farsightedness and stolid devotion to remote ends which have marked English policy for five hundred years. It will probably be more humane and less imperious, but it will want the national self-confidence, and will not long retain the wealth which has made England a first-class power. A very little instability in legislation would cause its disappearance.

## THE STORY OF THE GREAT AMERICAN TUNNEL.

A FEW weeks ago (July 8) the first regular passenger train rolled through the notorious Hoosac Tunnel in Massachusetts. The completion of a work bearing the same relation to all other tunnels in America which that of Mont Cenis bears to the tunnels of Europe, is a fact of more than local interest, and the history of the enterprise contains not a few lessons of far-reaching application. So impracticable has the whole undertaking appeared that popular lecturers have long been accustomed, especially in Massachusetts, to refer to the time of the completion of the Hoosac Tunnel as a synonym for eternity. Many may be surprised, therefore, to learn that the real beginning of the work dates back less than twenty years, although fifty years ago a tunnel under the mountain was talked about, not for a railway but for a canal, to perform for Massachusetts the same function which the Erie Canal performs for New York. The reason why so much attention has been directed to this mountain in the northwestern corner of Massachusetts, and why for over fifty years it has been apostrophized, "Be thou removed," is that a prolongation of the Mohawk Valley in New York strikes the valley of the Deerfield River in Massachusetts, and the two valleys, including the valley of the Hoosick River, form therefore the most natural and, in fact, the only possible low-grade route between the West and Boston; or, more properly, would have formed such a route could the five miles of Hoosac Mountain have been taken out of the way.

After the abandonment of the canal project, which was not given up until some time after the ground had been actually surveyed, nothing was done until 1848, when the Massachusetts Legislature granted a charter in the usual form to the Troy and Greenfield Railroad Company for a road from Greenfield in Massachusetts to the State line of New York, there to connect with some road to be built from the city of Troy. It was understood, of course, that this road was to pass through Hoosac Mountain. In 1851, work was commenced upon the western end of the road, and at the same time the company petitioned the legislature for a loan of the State credit in order to build the tunnel—uncertainty with reference to the time of completion and cost of which prevented capitalists from investing in the stock of the company. This application, as well as another made in 1853, was unsuccessful. In 1854, however, the company found a more hopeful or a more pliant legislature, and the State loaned its credit to the amount of two millions of dollars for the purpose of building the tunnel, it being supposed at that time that the whole cost would be less than this sum. The tunnel was to be finished in six years from that time. The conditions of the loan were precisely expressed, and every precaution was taken apparently to guard the State against any loss. No scrip could be issued until the company had obtained stock subscriptions to the amount of six hundred thousand dollars, twenty per cent. of which was to be actually paid in in cash. In addition, seven miles of road and one thousand linear feet of the tunnel were to be finished. When these and some minor conditions were complied with, the State Treasurer was authorized to deliver to the company one hundred thousand dollars in scrip. Subsequent payments were to be made upon the fulfilment of similar conditions until the full amount of the loan should be delivered. As security, the State took a mortgage upon the road and other property of the company. Four years passed before the company was able to comply with these requirements, and, after an unsuccessful attempt to induce the State to subscribe for stock in addition to the loan, the first application for State scrip was made in 1858. After this there seemed to be no difficulty, and applications were made with increased frequency until July 9, 1861, at which date the State had paid out in all nearly eight hundred thousand dollars. Work suddenly ceased July 12, or three days after the last issue of scrip, and, soon after, the State foreclosed its mortgage and took possession of the road.

Two or three years of investigation by legislative committees brought to light the following facts: The company which had contracted for the building of the road and tunnel on the strength of the promised State loan, had not been able to secure stock subscriptions except for a very meagre amount. Six hundred thousand dollars was required before State aid could be obtained. Hardly one-tenth of this was ever subscribed by *bonâ-fide* subscribers. In this emergency, the contractors subscribed for nearly the whole amount desired, six thousand shares, the company agreeing to receive pay for the same in work. The company also agreed to turn over to the contractors all money received from other subscribers; also, to pass to them all State scrip as soon as obtained; also, to allow them to increase their contract price—at first three hundred thousand dollars, and afterwards two hundred thousand dollars more. It will be seen, also, that, in virtue of holding a majority of the stock, the contractors, Messrs. H. Haupt & Co., became the real owners and managers of the company.

The formal records of the meetings of the directors of the Troy and Greenfield Railroad Company for the succeeding four or five years furnish some very amusing reading. The meetings were held apparently at any time or place convenient to the four or five men who usually attended them—sometimes at the Fitchburg Depot, sometimes at the American House in Boston, and sometimes in Greenfield. At these meetings Mr. Haupt is always present. Sometimes he votes simply as a director; sometimes he acts as clerk of the meeting; again, he appears as a committee to receive subscriptions, which are to be paid to H. Haupt & Co.; again, he is appointed chief-engineer, or serves on the finance committee, or is appointed agent of the company to solicit subscriptions from towns. In fact, Mr. Haupt is really a wonderful man. He outdoes Mr. Oakes Ames completely, for he not only puts stock "where it will do most good," but he also puts himself where he will do most good—to himself. For instance, Mr. H. Haupt, as chief-engineer, certifies to the Troy and Greenfield Railroad Company—that is, to H. Haupt & Co.—that H. Haupt & Co., contractors, have done an amount of work which entitles them to receive four hundred thousand dollars in bonds and stock, and Mr. H. Haupt thereupon, as member of the finance committee, signs an order upon the treasurer directing him to pay H. Haupt & Co. the amount authorized by the chief-engineer. In recent years, we have become accustomed to very remarkable railroad management, but when we remember that all this took place before the war, we are obliged to credit Mr. Haupt with an originality and versatility of which it is impossible to speak too highly.

We take the liberty to digress for a moment to describe two or three of Mr. Haupt's little schemes, which, if not quite so amusing as the performances above-mentioned, may nevertheless have an illuminating influence on legislators and contractors. On one occasion, it became necessary to certify to the State Treasurer that twenty per cent. on all subscriptions to stock had been paid in *in cash*. But it had already been agreed that the contractors, who were the principal subscribers, should not pay in cash, but in work. Mr. Haupt, therefore, borrowed from a bank for an hour one hundred thousand dollars in bills, took them to the treasurer of the road, and received credit for a cash payment to that amount on stock subscriptions. He then produced an order from the finance committee, of which he was a member, directing the treasurer to pay H. Haupt & Co. one hundred thousand dollars in cash for work done on the road. The treasurer handed back the same bills, and Mr. Haupt returned them to the bank from which they were taken a few minutes before. Through the aid of this little game the treasurer was enabled to certify that the required amount had been received in cash, and the State Treasurer accordingly handed over to Mr. Haupt one hundred thousand dollars in State scrip. Again, a large part of the State scrip was expressed in sterling currency and made payable in London. Mr. Haupt contrived to secure this at a valuation of four dollars and forty-four cents to the pound at a time when the market value was four dollars and ninety-one cents, and thus in two years was overpaid more than fifty thousand dollars. Again, the northwestern corner of Massachusetts, on account of its rocky character, is impassable for railroads. In order to reach the New York line and connect with a railroad coming east from Troy, it was found necessary to build six miles of road through a corner of Southern Vermont. This required a charter from the Vermont Legislature and the formation of a separate corporation—the Southern Vermont Railroad Company. The company was formed and the road built, the contractors who built it being our old friends H. Haupt & Co. They received in payment fifty thousand dollars in stock (all the stock issued, thus making them sole owners of the road) and one hundred and fifty thousand dollars in first-mortgage bonds. The work cost about one hundred thousand dollars, the road being an easy

one to build. It was very necessary, of course, that the Troy and Greenfield Company should obtain control of this road, and accordingly they were authorized by the Massachusetts Legislature to purchase it, the State loaning the company two millions of dollars to make the purchase, and offering to take as security a mortgage upon the Southern Vermont Road when obtained. Who was at the bottom of this precious bit of legislation we do not know. We only know that the Troy and Greenfield Railroad Company (H. Haupt & Co.) bought the Southern Vermont Railroad of the stockholders (H. Haupt & Co.), and the State advanced double value for the purchase. But this was not all, for it was afterwards discovered that the Southern Vermont Railroad had been leased in perpetuity to the Troy and Boston Company for a small annual rent, and the State thus paid a heavy sum for a cheap piece of road over which it has no more control than it has over any road in Nebraska.

Mr. Haupt has certainly been well treated by all investigating committees. No word of censure was passed upon him. His unpaid bills were settled by the State. His feelings were injured as little as possible when the State finally took possession of his work, and he was allowed, while surrendering his claims to the State, to put on record a notice of the reservation of a right to petition future legislatures for redress of grievances. We need hardly say that he feels kindly towards everybody. His "sentiments are not embittered." "Grace, mercy, and peace" is his motto.

For two years after the disappearance of Haupt & Co. very little work was done upon the tunnel, although an energetic board of commissioners was prosecuting enquiries with reference to the future work. When the State took possession, it found, as might have been expected, that the road had been built in a miserable manner. Only the cheapest work had been attempted. Deep cuts were passed over, roads were left unbridged, culverts and ditches were not to be found, or, if found, had been constructed evidently not as aids to the running of trains, but as aids to the acquirement of State scrip. Even the location of the road, originally designed to make the best road the nature of the ground permitted, without regard to cost, had been changed so as to make a road of sharper curves and steeper grades, but of cheaper construction. Upon the tunnel the work was of analogous character. The line and grades had been changed so as to secure easier work, and in such a way that fifteen hundred feet would be added to the length. A large part of this tunnelling was afterwards abandoned or changed into an open cutting. The engineering work upon the tunnel was peculiar, if not original. A diagram of cross-sections, drawn by a competent engineer who examined the work, gives the idea of a tunnel through a snow-bank made by school children, though not nearly so regular as these sometimes build. Fortunately, the commissioners appointed by the State at this time were able men, who worked vigorously to bring at least partial order out of this contractor's chaos, and the measures initiated by them for carrying on the work upon the tunnel were followed in the main by the various commissioners and contractors who succeeded them. The State managed the work with varying success until the end of 1868, when a contract for the completion of the tunnel was made with the Messrs. Shanly, of Canada, who have faithfully finished a task of immense difficulty—finished, that is, the work specified in their contract. Of extra and unforeseen work there is yet a great deal to be done, for geologists and engineers alike have been somewhat deceived in the character of the rock and the quantity of water encountered, the former having proved more troublesome and the latter more plentiful than was anticipated. But the Hoosac Mountain no longer blocks the way to the West. The tunnel is an accomplished fact. We may now consider certain questions relating to its construction, its management, and its prospects, to which we call the attention of the Holy Farmer of the West.

Last year, in view of the approaching completion of the Hoosac tunnel, five gentlemen (the best-known of whom perhaps are Mr. W. B. Washburn, Mr. C. F. Adams, jr., and Dr. P. A. Chadbourne) were appointed as corporators of the Boston, Hoosac Tunnel, and Western Railroad (a new name for the former Troy and Greenfield). These gentlemen were directed to examine thoroughly the present condition of the tunnel and the connecting road belonging to the State, to put the latter in a condition for traffic, to examine into possible railroad connections with the West, and to suggest the best method for the future management of the tunnel property. According to the report of these corporators, the tunnel has now cost the State the sum of fourteen millions of dollars. We are struck at once by the great difference between this amount and the two millions at which the work was first estimated, and naturally ask for the reason of this difference. We have already shown that nearly all the money advanced by the State to the Troy and Greenfield Company was wasted. That so great an undertaking fell at first into hands so incapable is greatly to be deplored, and that the State was culpably negligent in allowing its money to be thus thrown away cannot be disputed. It is evident also that the State officials had no adequate conception of the vastness of the work undertaken, until some time after the first contractors had failed. The first commissioners were able and energetic, and, for a few years, the work was carried on in an effective manner. But the unavoidable "rotation" by which we are cursed came at last, and inefficiency took the place of ability. When the contract was given to the Messrs. Shanly, the State had already paid out five millions of dollars. This last contract, which was confined to the tunnel proper, cost nearly five millions more, and the rebuilding of the badly-built railroad, with land-damages, official salaries, legal fees, sums paid to experts, large quantities of extra work not provided for in the contracts, and interest upon the various sums advanced during eighteen years, bring up the cost to the enormous sum mentioned by the corporators. Moreover, as nearly the whole tunnel will probably require brick arching before it can finally be pronounced perfectly safe, another large sum is to be added to the above amount.

But assuming the tunnel to be ready for use, what is its present situation, and what are its future prospects? The hole is indeed through the mountain; but who will go through the hole and pay for the privilege of so doing? This is a vital question, and only as it is successfully answered can the tunnel enterprise be saved from failure. At present, one terminus of the tunnel-road is at the country village of Greenfield. The other terminus is not even at a country village, but at a State line. If the tunnel be likened to a bridge, it is a bridge with no roads leading to it, and with no people who care to cross it. Concerning it, the expression is almost true that it begins and ends nowhere. A host of ludicrous images is unavoidably suggested by the present attitude of Massachusetts in relation to the tunnel. The tunnel was built too soon. Whatever may be the call of the future, there was certainly no demand for it when it was begun, nor is there any real necessity for it to-day. At present, the tunnel-road can do nothing whatever without the help of the Troy and Boston road upon the one hand, and the Fitchburg road upon the other, for its local traffic is insignificant. But these two roads are, for the most part, only second-class single-track roads, with iron rails, and any attempt to do over them the enormous business of a through line would result in pounding them to pieces in less than six months' time. But the tunnel was built to serve as part of a through road, and only if used as such can its great cost ever be repaid. These two connecting roads, therefore, must be almost entirely reconstructed or new roads built before the tunnel can begin to fulfil its mission.

This consideration brings us to the first proposition made respecting the future management of the tunnel, which is, that the State shall buy out and complete the connecting lines to the Hudson River, and thus furnish, under State ownership and management, the desired rival to the present Boston and Albany Railroad. This action undoubtedly would greatly please Mr. Wendell Phillips and a few others like-minded, as it would be the first step in answer to their present mild request that the State shall buy out a great through-line to Chicago. The stumbling-block in the way is the fact that this first step would cost, in round numbers, twenty millions of dollars, and, in the present condition of the State finances, the prospect for the appropriation of this sum is altogether hopeless—hopeless, we mean, so long as gold and silver furnish the money of the nation. If Messrs. Phillips, Butler, Kelley & Co. can convince the people that twenty millions of dollars can be manufactured with a printing-press, then something may be done in furtherance of this plan. In the meantime, what remains? The State of Massachusetts came into possession of the Hoosac tunnel originally by foreclosure of mortgage. It did not desire the property, but undertook the task of finishing the tunnel in order to get back, if possible, the money already advanced, exactly as banks sometimes finish houses when the builders who gave the mortgages have failed before their work was done. One of the simplest methods of getting out of a very bad fix, therefore, and from very many points of view the most sensible method, would be for the State to imitate the banks and sell the tunnel to a private corporation as soon as possible. This might be done, of course, with some more or less obvious restrictions, and also with permission to consolidate with other companies, and thus to form an efficient trunk-line to the West. There is, however, so strong an opposition to this course that the legislature expressly forbade the corporators above-mentioned to take this proposition into consideration at all, and for the present, therefore, as it fails to receive candid discussion, it may be regarded as impracticable.

Two possible propositions remain. The first is the one earnestly advocated by the corporators—namely, a mixed system of State and private ownership, under which a powerful consolidated road might be formed by the union of several connecting roads with the tunnel-road, the State

being one of the partners in this corporation, and to be represented by one-half the members of the joint board of directors. This seems complicated; but, apart from any theories of the State management of railroads, would probably be the quickest method of forming a large and powerful line. If State directors could be trusted to look after the interests of the State as faithfully as other directors can be trusted to look after the interests which they represent, this might be at once accepted as the very best practical method of escape from the present embarrassing circumstances. But unfortunately it is difficult to understand how it is possible to ensure efficient protection of public interests in any partnership concern. If it can be done anywhere, it can probably be done in Massachusetts; but even in Massachusetts we should feel very doubtful about the result. If the experiment should be fairly tried, it would be watched with interest. The experiment, however, will not be tried immediately, even in Massachusetts, for the bill in its favor was voted down at the last session of the legislature, and the only possible plan remaining was adopted in its place. By this plan, known as the "toll-gate" plan, the State remains sole owner, puts the tunnel under the care of a superintendent or manager, and simply collects toll of all passengers and freight passing through it. The plan has the merit of simplicity; but this is almost the only merit it possesses. As a permanent measure it is condemned, because it will not pay, and also because it directly interferes with the chief purpose of the tunnel—the creation of a powerful through-line. As a temporary expedient, however, it is most admirable. It can be easily altered when necessary; and, in the meantime, it gives a chance to all who are interested to enquire and to think. Mr. Adams and his associates may take comfort in the fact that the defeat of their plan was followed by the adoption of no antagonistic plan, but of a simple time-gaining expedient, which leaves all serious questions unsolved.

## TORY MISMANAGEMENT.

London, July 31, 1875.

SOME weeks ago I called your attention to the state of confusion into which Tory mismanagement was fast reducing the business of Parliament. Since then matters have not improved. On the contrary, they have gone from bad to worse; and we have arrived at this, that one of the strongest governments of the present reign has been seriously shaken and discredited in the eyes of their supporters and of the country by the irregular proceedings of a well-meaning, indiscreet enthusiast. No government ever started with a better chance. They had a clear working majority of faithful and well-disciplined followers sent by the English constituencies. They were thus independent of the Scotch and Irish vote—no small consideration to those who wished an unembarrassed régime. The country wanted rest from all sensational legislation and from all troublesome interference by government departments in the affairs of life. It would have been satisfied with very little. A few remedial measures of a mild domestic type, the repeal of obsolete and the consolidation of effective statutes, and a firm but temperate and kindly administration of public affairs, would have been a sufficient programme. A magnificent surplus of six millions was lying in the exchequer; the prestige of the successful conclusion of the Ashantee war threw a halo over the Treasury Bench. The opposition were disheartened and disorganized. They were too feeble to harm the Government by fair, and too chivalrous to harass them by factious, fighting. Everything was in favor of the administration. Wise men saw no reason why they should not survive the full seven years of this Parliament, and perhaps begin another. Sanguine men of one party and desponding men of the other spoke of the Tories remaining in power for a quarter of a century. The gloomiest croaker could not have suggested that a short two years would see the Government sunk into general disfavor—so seriously damaged that, but for the disintegration of their opponents, a change of government might almost have occurred this year.

It is not difficult to see the causes of this collapse; and if you will bear with me while I run over the principal Parliamentary events of the last two sessions, I think I can make them clear.

The Queen's speech last session promised legislation as to the transfer of land, the rearrangement of the courts of judicature, the relationship of master and servant, and the question of licensing. The only fraction of these promises that was carried out was the last. The Government came into power on the votes of the licensed victuallers, and they had to be rewarded. The Licensing Bill did not achieve much for them. It permitted them, however, to keep their public-houses open for an hour each day longer than previously, and secured in exchange their continued goodwill and their suffrages at the cost of the demoralization, for an extra hour per day, of the public. The other parts of the programme were abandoned for the session. The large landlords did not care to have the transfer of land simplified, and it was desirable to keep them well disposed towards the Government. The influential Tory peers did not wish a rearrangement of the courts of judicature, which might involve the abolition of the jurisdiction of the House of Lords, and no interest cared to press the question. The relationship of master and servant was more ticklish. The workingmen have votes now, and were urgent for some measure in their interest. But the employers of workingmen have also votes, and deprecated the passing of a new measure on this subject when the old one was still on its trial. The Government being in a cleft stick, so to say, between the workmen and their employers, bethought themselves of a seasonable delay, and appointed a committee to report upon the subject. So much for the measures promised in the Queen's speech of 1874.

They had repaid the licensed victuallers for their support at the election; but they owed a heavy debt of gratitude to another important section of the community—the clergy of the Established Church. In an evil moment they remembered the Endowed Schools Commissioners. These gentlemen had offended the clerical interest by carrying out a policy which had the effect of opening old endowments of the pre-Reformation period to the sons and daughters of parents who belonged to other denominations than the Church of England. The Government, in order to do their clerical supporters a favor, determined to cashier the old Liberal Commissioners and appoint new Tory Commissioners in their place, and attempted to direct all the old endowments into one channel—the channel, namely, of the Church of England. The first part of this policy they succeeded in carrying out, but not the second part. They were startled at the feeling aroused in the country by their proposals. They got into a panic, and dropped the dangerous clauses, ingloriously covering their retreat from an untenable position by accusing the official draughtsman of Government bills, who acts only under the instructions of the Government, of draughting clauses that were incomprehensible. But still further to conciliate the church, or rather that part of the church which is powerful in elections, they took under their active protection the bill "to put down Ritualism." The Ritualists are politically an insignificant body, and so they were trampled upon; and this pleased the other sections in the church which have some political insignificance; and thus they paid off their heavy debt of gratitude to the clerical body.

But there was another section of the community—not, perhaps, so powerful socially as the clergy, but still of weight in elections, and especially in metropolitan elections—the cattle-slaughterers, the blood, bone, and soap boilers, the manure manufacturers, the tallow-melters, and other dealers in unsavory trades in London. These important industries had to be conciliated. By certain provisions of an act passed in 1844 it was enacted that all who carried on such manufactures in certain parts of London should be bound to discontinue them after thirty years. In other words, thirty years' Parliamentary intimation was given to all owners of slaughter-houses, and other abominations of the kind, that, after 1874, they must clear out of London and carry on their nasty work outside the town, as in most Continental cities. They all knew the fate that was impending, and had known it for thirty years. If a government possessed of moral courage had been in office, they would have gone almost without complaint. But, fortunately for them, and unfortunately for the community, at the end of their thirty years' warning an administration was in power eager to conciliate any interest that had votes. The clauses of the old act of Parliament were repealed, and an act was passed forbidding, it is true, new manufactories of the kind to be erected, but sanctioning the old ones which had been condemned in 1844. And so last session closed, and the whole metropolitan press sang pæans over the administration.

This session opened with a flourish of trumpets and a great promise of sanitary and domestic legislation. I need not recapitulate the names of all the multitude of measures that was announced. Very little of them remains, except their names in the order-book. The Pollution of Rivers is gone with the late floods; the manufacturing interests were too strong for it. The bill for the appointment of a public prosecutor has not even been introduced. The Judicature Bill was withdrawn because the Duke of Buccleuch and Lord Redesdale and some more Tory peers were offended by the proposal contained in it to curtail the privileges of the House of Lords. The Merchants' Shipping Bill—the only measure, as it appears, in the Ministerial programme about which the country felt any interest—was abandoned a week ago, and reintroduced in an abbreviated form yesterday, because the Ministry became panic-stricken on discovering that the country was in earnest, and was determined that the lives of the seafaring men in England should not continue to be endangered owing to the supineness and *insouciance* of the Government. These are the failures of the session; and now

see what are the successes? A measure has been passed to reintroduce an insidious form of purchase in the army, in the interest of the wealthy officers. Another has been passed to clear out the wretched inmates of the city "rookeries," who have no votes, in order to build cottages for artisans who have votes. This is a useful measure, if it only can be put into operation. Two other measures which may have an important bearing on the welfare of the newly-enfranchised working-classes have received the Queen's assent—the Friendly-Societies and the Employer and Workmen Bills. If to this short catalogue the Agricultural Holdings Bill, about which I wrote to you the other day, be added, you have the sum of the legislation of this protracted session.

And now I hope you have gathered some idea of the principal causes of the decline of the present Government in popular esteem. The great distinction to be drawn between this Government and that of Mr. Gladstone is this: that the latter legislated for the community at large, and the former for individual classes in the community. It has been all class legislation since March, 1874. The policy of Mr. Disraeli's Government in introducing their measures has not been regulated by the consideration, Will this measure be for the amelioration of England? They have not said to themselves, Will the country be happier and better if this becomes law? does it redress some widespread grievance or glaring injustice? The question they have asked is this: Will this measure gratify such and such a class of men who have votes and political influence—men who will wish to keep us in power and vote for us at the next general election? It has been the policy of electioneering agency throughout, and, as a natural consequence of such a policy, every proceeding initiated by the Government has been characterized by a timidity and fear to give offence which in a strong government is contemptible. If any of their proposals presses however gently upon any interest, and that interest cries out, the pressure is at once removed. Either the whole bill is dropped, or the troublesome clause is dropped, or a provision is inserted in the bill to enable any one who feels aggrieved to withdraw himself from the operation of the measure. And, along with this desire to keep things comfortable all round, there is displayed on the Treasury Bench an inconsistency and vacillation which, when compared with the strong determination of the late Government, is almost pitiful. The policy of the Parliament is very much what the Cabinet makes it, and the Cabinet is very much what the Prime Minister makes it. The present Prime Minister has never liked the drudgery of work, and has always smiled at earnestness of purpose. He will use all his ingenuity to "dodge" a difficulty and all his never-failing humor to laugh it off; but he will never face it and conquer it in fair fight. Hence there has been an air of unreality, a desire for "dodging," and an absence of earnestness in every detail of the Ministerial policy. The country have borne with this for two years. But they will stand no more of it. The contrast between the zealous and unselfish earnestness of the member for Derby—an earnestness that has nearly cost him his reason—on behalf of the seafaring men of England, and the cynical indifference of the Government, who were ready to sacrifice the sailors' lives in the interest of the tenant-farmer's pockets, has roused the best feelings of the country. Next session the Government—whether under Mr. Disraeli or some other Prime Minister—will be compelled either to mould its policy in the interests of the community and not in the interests of Tory voters only, or to make way for another Government which will.

# Correspondence.

## A NORWEGIAN SCHOLAR IN POLITICS.

To the Editor of The Nation:

Sir: At the very time that your excellent article on "The Scholar in Politics" was being issued, an episode was taking place in our political campaign which illustrated some of its principal points, and has lately become the topic of lively discussion. The central figure is Prof. R. B. Anderson of the State University. He is a Norwegian by birth, a contributor to the large Norwegian paper, the *Skandinaven*, of Chicago, and author of a book called "Columbus not the Discoverer of America" and others.

You very justly showed that mere declamation in favor of purity and against corruption in the abstract is of little avail. It must be enforced by personal examples. To quote the words of the article in question: "It becomes the duty of the reformer not so much to preach purity as to give reasons why Smith or Jones must be got out of the way; and this is an unpleasant task, which the scholar in politics like other people naturally avoids if he can." This giving of reasons is precisely what Professor Anderson has done in a recent case, and the result seems to show that the scholar in politics must be prepared to meet not only the ordinary resentment which Smith or Jones naturally conceives against anybody who interferes with him, but a special indignation directed against him by reason of his profession. The circumstances are briefly as follows:

The Norwegians alone of the foreign element of our population have been in the habit of voting the Republican ticket almost in a body. Their numbers are so considerable that of late they have been given a representative upon the State ticket. This year it was agreed that they should have the Secretary of State. They presented to the convention the names of two of their most respectable compatriots; but Hon. S. D. Barron, State senator from the northern counties, displaced them both with a candidate of his own named Warner, whom he eulogized as a more truly representative Norwegian than any other who had been named. The delegates protested that Warner was scarcely known; that it was certain from what was known of him that he was entirely incompetent for the position; that Warner was not a Norwegian name; and, finally, that he was not and would not be accepted in any sense as representative of their element.

At this juncture appeared the scholar in politics in the person of Prof. Anderson. His position and acquirements, and his residence at Madison, where the convention was held, naturally caused his advice and assistance to be solicited by his countrymen. He interested himself to the extent of trying to procure for them the most creditable representative possible. Warner, it seems, is of Norwegian parentage, but was brought up by an American family, changed his name, and long since lost any identification he might once have had with the Scandinavians. He is said to be illiterate, and not in any respect competent for the important office in question. It is notorious that Barron secured this nomination for him in order to remove him from his own path as a candidate for the State Senate this fall, having been pressed very hard by him at the last election. Barron, incensed by the professor's interference with his plan, approached him and told him fiercely that it was in exceedingly bad taste for a professor to have anything to do with politics, and that he was no more than an officious meddler. It happens that Barron is one of the regents of the institution in which Anderson is professor. His rebuke was met with a spirited reply: "If it is proper business for a regent," said Mr. Anderson, "it is certainly proper for a professor."

The tenor of the press comments on this rencontre strongly favors the senator and abuses the professor. The leading Republican newspaper of the city says that "the rebuke was timely and deserved," and the opinion is generally concurred in. It is agreed that politics is so degrading that nobody can touch it without contamination, especially nobody whose position holds him up as a guide and a respected model before a number of other persons. With a wild lack of consistency, or perhaps upon the theory that the politician was lost beyond redemption any way, the whole opprobrium is heaped upon the professor. The fate of this professor, who thought it was proper to manifest some anxiety for the nomination of a competent and respectable Secretary of State, instead of an ignorant and rather disreputable one, does not seem likely to encourage other scholars in politics who might feel like stating their views personally about Smith and Jones.—Respectfully,

W. H. Bishop,
Ed. *Commercial Times*.

Milwaukee, August 10, 1875.

## THE OHIO ELECTION.

To the Editor of The Nation:

Sir: The pending election in this State has come to be regarded as a movement in the Presidential election, and therefore it has drawn the attention of the whole country. The Democratic managers in this State mean that this election shall fix the doctrines or "issues" of the Presidential election, and the candidate thereof; and they have had the sagacity or the ill-judgment—according as the sequel shall show—to take the field in advance, assume the aggressive, and force the canvass entirely upon a single question of national policy; that question, as they state it, being whether Congress shall make money plenty or scarce; whether it shall make good times or hard times; whether it shall issue to the people plenty of their own money—greenbacks—or take these away, to give to banks the privilege to issue their money.

The fact that orators stump the State, delivering harangues of which this is the theme, and inciting "the people" to hostility to the bond-holders, the banks, capitalists, money-lenders, the property-classes, and to creditors of all sorts, and try to persuade them that the emission of "the people's money" will shove by all these "robbers" and put money directly into their

hands, and that they think to carry the election by these means, does not seem to support the common boast that the average intelligence of our people is higher than that of any other, nor the theory that ability to read and write is a safeguard against political demagogues. If we could predicate a judgment upon the popular intelligence, we could predict the result of an election which is made to hang on such absurdities; but can we assume anything upon the popular intelligence as to the office of money? We have a multitude of examples that men of pretty good intelligence in general affairs are daft when they touch the currency question. Besides, the idea that the emission of paper money is an engine of prosperity is one of the oldest of American traditions. The national Constitution tried to extinguish it, but it found the habits of a people stronger than written constitutions. We have a multitude of "statesmen," political financiers, "able editors," and "publicists" who sincerely think the emission of paper money is the creation of wealth; that Government should issue enough to make prosperous times; that the volume of it has no relation to its depreciation, and that therefore this is no measure of its sufficiency.

Therefore we may not predicate upon the popular intelligence a confident opinion that the people of Ohio will reject these shallow demagogues, who promise that in return for their votes they will give them plenty of greenbacks and good times. We see them tempted by a delusion which was always captivating to the American people, and we have to think that there has been no considerable class of public men or of writers for the public journals, with correct ideas of the laws of money, to impress the public mind, and shield it against these paper-money fallacies. It is true the Democratic party has at times and places, and apparently with popular support, declared for "hard money," but this was always against some special bank-issue creation of the other party, and it could invoke popular prejudice against the banks, which certainly gave occasion enough by their frequent failures; but now, whilst the party has abandoned hard money, it still makes use of the popular prejudice against banks, and it represents them as usurping the place of "the people's money"—greenbacks.

Can an attempt to predicate upon the popular intelligence an opinion of the way the people will vote, be aided by a view of the principles or policies which the Republican platform or speakers present as the alternative to these Democratic fallacies? Their platform declares:

"That a policy of finance should be steadily pursued which, without unnecessary shock to business or trade, will ultimately equalize the purchasing power of the coin and paper dollar."

This is very good for platform literature; but, like the wise opinions of Captain Jack Bunsby, the meaning lies in the application thereof, and the campaign speeches give the application. Gen. Hayes, the Republican candidate for Governor, pleads for the Republican party that—

"They do not propose to force resumption by a contraction of the currency. They are satisfied to leave to the influence of time and the inherent energy and resources of the country the work that yet remains to be done to place our currency at par."

This is Boutwell's "growing up to specie," expressed in prettier words. The hearer would never suppose there was in existence an act of a Republican Congress prescribing that on Jan. 1, 1879, the Secretary of the Treasury shall redeem the greenbacks as fast as presented, and giving him bonds to sell for gold to make this redemption. Is not that a law for the most violent contraction when the time comes? So it was thought; but it seems there was a mistake, for Senator Sherman, the leading financier in Congress, who followed General Hayes in opening the Republican campaign, denied that the act contemplated any contraction, unless, indeed, there should be found to be more currency than was demanded by "the wants of trade." He assumed that the act does not intend the redemption of the notes, but to "float" them on the promise of coin convertibility, as banks of issue float their circulation; and he argued that this, so far from causing contraction, would actually inflate, by adding the specie to the paper money. He said:

"The great body of our present circulation could be maintained at par in gold, and all the gold now lying idle, and all that is produced by mining, could be added to and mingle with the paper-money in daily use."

The like of this, he told them, has already been done in France. The next great gun in the campaign was fired by Senator Morton, at Urbana on the 7th. With his accustomed sagacity, he sought to turn the discussion to other matters, and to make chiefly prominent the bad character of the Democratic party, and its dangerous designs in the South and upon the public credit. But when he came to the currency question, he also denied that the Specie-Payment Act contemplated any real redemption of the greenbacks or any contraction. He said:

"The bill provided that the greenbacks should not be retired so as to leave less than three hundred millions in circulation, and it contemplated that they should continue to be a part of the circulation, and the main purpose was to improve their quality and bring them to a par value, and with them the bank-notes, which were redeemable in greenbacks. . . . The theory of the bill in another respect was, that there should be neither contraction nor expansion of the currency; that the volume should be maintained as nearly as possible at what it then was."

So we find that when the act says, "On and after the first day of January, A.D. 1879, the Secretary of the Treasury shall redeem in coin the United States legal-tender notes then outstanding, on their presentation for redemption," etc., and authorizes him to use to this end the surplus revenue, and to sell bonds to buy coin for this redemption, it does not mean really to redeem the notes, but to keep them all afloat; that the Government is not to go out of the business of issuing currency, nor to withdraw its legal-tender notes; but that it is to continue to issue according to "the wants of trade," and is to make an effort to float three hundred millions of legal-tender notes on the promise of specie, and on top of these all the bank circulation that can be floated thereon. And as the provision for retiring greenbacks in the ratio of eighty per cent. of the increase of bank circulation uses the same word "redeem," it thus appears that these can be reissued; for it is found that to redeem a promise to pay means to float it. And so the Treasury is to sell bonds to buy coin to pour into a bottomless hole by redeeming and floating between seven hundred and eight hundred millions of paper money, and as much more as "free banking" shall bring forth.

What is the situation thus presented to the popular mind? Unhappily specie payment is impossible without a preparatory contraction or a violent following contraction; but neither party in Ohio dares to propose contraction, or to admit that it will result. Each talks idiotically of "the wants of trade" as to be the regulator of the volume of greenbacks that Congress shall emit. And while the Democratic speakers boldly feed the popular folly by denouncing contraction, and promising more money, the Republican speakers have to deny contraction, and their senatorial financier is constrained, by his view of the party necessity, to declare the redemption act a fraud, and to make a quasi-promise of inflation.

If we forecast the election upon the intelligence of the people, and if we take the speeches of both sides as trustworthy estimates of their intelligence, can we say that either party presents such superior merits as to make its election rationally sure? Are we not left rather to conjecture how far party spirit, party lines, and the distrust of the other party will hold the Republican majority together against the influence of hard times and the seductive promise of flush paper money?

In truth, the Republicans are heavily handicapped by the crooked course of their party in Congress. At the first session of the last Congress they were carried away by the cry for more banks in the West and South, which they tried to satisfy by withdrawing circulation from the East. But the banking privilege is unavailing without capital, and this was the real want. At the second session they were still under the influence of the cry for more currency, and they tried to grant more; but Grant's views had meanwhile changed from inflation to contraction, and he vetoed their inflation bill. The influence of the Administration was aided by a clamor of the Eastern press for something to be done to bring in specie payment. On the other side was the popular fear of contraction, and the popularity of more money. The Republicans tried to ride both horses by embracing both inflation and specie payment in one act. This they are now constrained virtually to declare a fraud. Yet it stands a law which, without any preparation save to make the business-panic chronic by the fear of the impending and unknowable, with even a provision for preliminary inflation, prescribes that on the 1st of January, 1879, the Treasury shall begin to pay the United States notes as fast as presented, and thus shall absolutely withdraw the whole volume of the greenbacks from the circulation, and from under the vast bank circulation which rests upon them. And it is well known that this is the Secretary's understanding of the act, and that it accords with the latest phase of the President's views.

If the people were intelligent as to the nature of money, would they be captivated by this prospect? Thus, whether the law be represented as honest or as a fraud, it is a heavy load on the Republicans in this canvass. It deprives them of that upright standing which Republican intelligence and Republican honesty demand, and of that firm base which they need in order to withstand the demagogic fallacies of a party which has cast aside all its traditions, all principle, and all regard for the general welfare, in order to win the election.

REPUBLICAN.

OHIO, July 10, 1875.

# Notes.

THE official report of the Beecher Trial has begun to be edited, with notes and references, by Austin Abbott, and the first volume has now appeared (Geo. W. Smith & Co.) It makes 829 pages 8vo, and ends on the seventeenth day with the conclusion of Moulton's testimony. A number of portraits and biographical sketches accompany the report, and apparently more are to come. The *Times* has, in consequence of the demand for it, thrown its review of the trial into pamphlet form, with corrections and additions.

—J. R. Osgood & Co. have in preparation for publishing in the fall 'A Bibliography of the Original Quartos and Folios of Shakspere, with particular reference to copies in America,' by Justin Winsor, Superintendent of the Boston Public Library. This notable work is designed "to provide in a manual what cannot now be found in a single volume—a sure means of testing the genuineness and state of copies of the early quarto and folio editions," calling to the aid of the descriptive text the heliotype process of reproduction in facsimile. There will be sixty-eight illustrations of this kind, nearly one-half of which will be made directly from originals, most of these being in the famous Barton Collection of the Public Library, but some existing only in England, and being unique even there. As all other modes of facsimile have proved more or less defective (for example, the silver photographic prints made by Mr. Halliwell having faded into illegibility in twenty years), Mr. Winsor will, by way of comparison, give two heliotypes of Harris's very skilful direct, hand-wrought facsimiles, and one of Ashbee's lithographic transfers by tracing. The reading-matter will consist of the revised and recast bibliographical notes of Mr. Winsor, which have already appeared in his monthly reports, supplemented by a history of the principal collections of the quartos and folios, and a collation of opinions on the state of the text of these varieties, a review of their commercial valuation, and other interesting data. Two hundred and fifty copies quarto will be printed, after which the plates will be destroyed; and American subscriptions (at $25 each) will be received for only one hundred and fifty, the rest of the edition being reserved for Europe. There is no need of saying that the execution of this Bibliography will be highly creditable to the author and to the institution which he so admirably conducts.

—The superiority of the heliotype, for certain purposes, to all other modes of illustration is just beginning to be recognized. We have often called attention to it, and we make Mr. Winsor's work another occasion for so doing. But we have also before us Mr. Whitmore's 'American Genealogist' (3d edition; Albany: Joel Munsell), to which the author has prefixed a heliotype portrait of himself, in order to show how cheaply the compilers of family histories can illustrate them with enduring and speaking likenesses of the persons whose lineage they record. So, too, the latest volume of Proceedings of the Massachusetts Historical Society (1873–75) is greatly enhanced in interest and value by five illustrations in heliotype. These are quite various: one being from a French caricature of the last century—an etching; another from silhouettes, drawn by shadow, of Gen. Washington and his brother John, in the second Presidency of the former; another from a page of John Adams's diary commenting on the destruction of tea in Boston harbor the night before; another from the oil painting of Gov. Christopher Gore; and the last from the original map accompanying the Zeno narrative of 1558. This is, we believe, the first employment of the heliotype process for illustrating these Proceedings, but we are confident that it will not be the last. A number of opportunities for its use besides those above-mentioned will occur to every reader of the present volume. To point them out would be to enter too largely into the contents, with which we must deal briefly. A discussion of the way in which slavery was abolished in Massachusetts leads to the curious conclusion that George Mason, of Virginia, was the remote occasion of it. He was the author of the Virginia Declaration of Rights adopted at Williamsburg June 12, 1776, which John Adams copied in 1779 when framing the first article of the Massachusetts Declaration of Rights embodied in the Constitution of 1780. It was to this article that Chief-Justice Cushing referred as a decree of emancipation when charging the jury in 1781 to find Nathaniel Jennison guilty of assaulting Quack Walker. Had the same "glittering generality" found the same judicial interpretation and the same public opinion in Virginia, how different might have been the course of history on this continent. On page 283 there is a very suggestive letter written by the late Professor Agassiz to Mr. Robert C. Winthrop in relation to Mr. Peabody's then undetermined endowments. It marks out a scheme of popular aid to science, letters, and art which, utopian as Agassiz himself thought it, is well worth considering as a substitute for Government patronage.

—In Massachusetts there is annually published, along with the laws of the year, commonly called the 'Blue Book,' a statement made by the Governor to the Legislature of the pardons granted during the year past, and the reasons for granting them. The 'Blue Book for 1875' has lately appeared, and an examination of the reasons assigned for the eighty-seven pardons granted during 1874 suggests some criticism which may be interesting to our readers. When a man is accused of crime, it is for a jury to say upon their oaths whether the witnesses against him deserve belief, whether their evidence, if believed, proves that he did the act charged, and whether he did it while of sound mind and responsible for his actions. It is then the duty of the presiding judge to impose sentence, in which the law often gives him a discretion, according to the aggravation of the offence as proved before him. If there have been any irregularities in the proceedings, the sentence can be reversed by a court of appeal. In each of these stages every precaution is taken to secure a just and correct result, and that result, when reached, ought, in the absence of fraud, to be final. How is it in fact? The Governor and Council of Massachusetts, it seems, feel authorized to review the evidence and find a new verdict of their own, which releases the prisoner. Thus, in case 14 of the list just cited, a pardon was granted because "the prisoner was evidently insane when the assault was committed" (a point of which the jury were clearly the best judges); and in case 50, because the "Council felt there was reason to believe" that the witnesses for the prosecution were perjured. In other words, they presumed guilt to exist in several persons who had never been convicted, in order to be able to presume innocence in one who had been convicted. Again, the pardoning body is in the habit of thinking that judges abuse their discretion in the matter of sentences. In more than a dozen cases the sentence was remitted because it "seemed too severe" (as in case 29), or because the prisoner, having served part of it, was "regarded as sufficiently punished" (as in case 40). If the judges do really err on the side of long sentences, it may be accounted for by the fact that the term is very likely to be curtailed, while it cannot be extended, by a superior power. Further, the pardoning body takes upon itself to reverse a judgment, as a court of appeal might do, if they think there is a legal error in the proceedings. In case 5 pardon was granted because of "illegality of sentence. The property stolen was less than $100 in value, and the prisoner could not be legally sentenced for more than one year."

—In these cases pardons were granted for reasons which might legally have availed the prisoner if they had been alleged before the proper tribunal at the proper time, and then made to appear true. But the prisoner failing to satisfy the jury that he was insane, or the judge that the punishment was unduly severe, had still a chance left with the Governor's Council. In other cases the reasons alleged are no reasons at all, and could have had no possible influence with any tribunal bound to respect the law and the facts, but seem to have had their effect on a tender-hearted Governor and Council. Thus, in at least twelve cases, pardon was thought proper because when the offence was committed the prisoner was intoxicated (cases 13, 52, 53, and others). This novel and startling doctrine, that drunkenness excuses crime, is applied more especially to extenuate the crime of rape (cases 81, 62, 70). Let any one imagine the result of this new principle of the criminal law should it become generally known to the vagrants who now infest the country. Another rule of the law of pardon seems to be that when two are jointly convicted, and one is pardoned, it is but fair that the other should be let loose also. This reasoning appears to have had force in cases 38 and 83. Neither can the Governor bear the piteous sight of the parting of twin criminals convicted of the same offence. "Case 47. —Prisoner's sentence was longer than that of his brother, who was to be released Sept. 1. Prisoner was pardoned on the same day, in order that the twin brothers, who had never been separated, might leave prison together." With this conclusive reason for clemency to a thief we leave the Massachusetts Blue Book, though its treasures are far from exhausted.

—The increase of ocean travel and the costly improvements in the construction and propulsion of vessels, making their loss more serious, have had the effect of turning the attention of the travelling as well as the mercantile community to our want of accurate charts of the waters and coasts of the world. This is graphically shown by a map accompanying a paper read before the United Service Institution in England, on which the "surveyed," "partly surveyed," and "explored" coasts are shaded or colored differently. In the paper, little reference is made to surveys conducted by other than British officers, and persons unfamiliar with the subject would naturally infer that we owe the only accurate charts in existence to the efforts of the

British Government, while in fact less than one-half of the accurate charts have been constructed from English surveys. However, we are concerned here rather with the map, and a close estimate of the coast-coloring gives the following result: one-sixth surveyed, one-third partly surveyed, one-half simply explored. This does not include the polar regions nor the oceans; it comprises the frequented coasts only, where merchant-ships seek freights and men-of-war cruise. Among the coasts simply "explored" we find the western coast of South America comprised between the equator and 45° S. latitude (including Chili and Peru), almost all the islands of the Pacific and Indian oceans and China seas, about one-half the western coast of Africa, almost all of the western coast of Mexico, and a large part of the eastern coasts of Asia and Africa, besides much more which it is not necessary to enumerate. Of the coasts partly surveyed, we find the remainder of South America, with slight exceptions, much of Africa, Asia, and North America, and a great part of Europe. Of the coasts said to be surveyed, only those of the British Isles, France, Denmark, Sweden, and Norway, the Baltic coasts of Russia, and the eastern coast of the United States, have been sufficiently worked over to warrant the term, although the bulk of the remainder, which is not much, may well be left until the wholly unsurveyed parts of the world are looked after.

—There is hardly an excuse for this want of accurate charts; and we will suggest a simple remedy, which we believe will find earnest advocates in the navy. In addition to the instruments forming a part of every cruiser's outfit, there should be furnished to every vessel in commission a complete set of surveying instruments. We believe this has been done in many instances. Within the limits of every foreign station there are large sections of coast-line, and numerous important and frequented ports, of which surveys are greatly needed. The whole number of vessels in commission in foreign waters is twenty-eight, of which twenty at least are admirably adapted to the work. Our national interests require that not less than this number should be retained in foreign waters, but that they should cruise from port to port with no other object than that of "showing the flag" is absurd. Every commander of a foreign station should be *ordered* to detail two-thirds of the force under his command for the purpose of surveying, and be held responsible for the work not only in quality but amount. In the opinion of many persons well qualified to judge, our naval vessels are better adapted to do the work on foreign stations than small vessels especially fitted for the purpose. Our naval officers are justly credited with having a higher average ability than those of any other nation; and, as regards the special branch of surveying, they are taught it at the Naval Academy, and have for many years formed the majority of those engaged in surveying our own coast, acting under the Coast Survey Office. This and many other needed reforms in a branch of the public service but little thought of and appreciated, can hardly be hoped for as long as the navy and the appropriation for its maintenance are regarded by the politician at its head and those surrounding him as legitimate means of advancing their personal aims and increasing the incomes of their friends. The cry "reduce the navy" would be changed to "increase the navy" if naval officers would strive to demonstrate their value and usefulness in peace as well as in war.

—The great age which Horace Binney had reached in a country in which longevity is popularly supposed to be uncommon, lent an interest to his closing years which otherwise they might not have had so completely. Whether this popular impression has any foundation in fact is more than doubtful, but there can be no doubt that it exists, and that where, as in Mr. Binney's case, not only was there professional and political eminence to create distinction, but a physical *tour de force* seemed to be performing itself with each succeeding year of life, the interest in the struggle between nature and his vigorous constitution annually increased. Mr. Binney died at the age of ninety-five and a half years. He had long since retired from the active practice of his profession, in which he early obtained reputation, but down to the day of his death retained his mental vigor and his influence as well. To such an extent, indeed, was this true that strangers in Philadelphia, coming there from the newer and more irreverent parts of the country, have been more surprised perhaps than by any other one thing to find the public looking up to and guiding their opinions in many matters by the advice of an old man not actively connected either with commerce, the professions, or the "Street," not, for these days, remarkable for his wealth, and keeping his hold upon the confidence and esteem of the younger generation solely by his venerable age, unsullied reputation, and accumulated stores of wisdom. This of itself was an interesting fact in a country which we have gradually come to look upon as rather a dangerous place for the old and feeble, and which foreigners have generally talked about as if we were likely before long to introduce the Polynesian custom of retiring the senior members of society by beating them on the head with a club. Mr. Binney has left behind him, besides his legal arguments, little to perpetuate his fame, though he took an active part in some of the important debates in Congress in the Webster-Clay-Calhoun period. His interests were chiefly professional, and his most important contribution to legal controversy was his argument in the Girard College case. When we think of the events at home and abroad which happened in his lifetime, it seems as if the mere living for ninety-five years in such a period of the world's history were action enough. Born in 1780, his life covered a space within which, jostling on each other's heels, came the separation of America and Great Britain, the formation of the United States, the meeting of the Tiers-États, the Revolution, the downfall of the French Monarchy, the Republic, the rise of Napoleon, the mighty European wars which altered the face of Europe and ended with the "Hundred Days" and the exile of the Corsican tyrant; the restoration of the Bourbons and their ruin, the Monarchy of July, the Second Republic, the Second Empire, the Third Republic, the Commune, and the humiliation of France by a power which but the day before had been a mere federation of incoherent atoms, the Septennat; the unification of Germany and of Italy. In this hundred years the commerce and habits of the world had been revolutionized by steam and the telegraph, and the country which as a young man he had seen arise out of the ashes of war, he beheld in his old age torn asunder again in the most gigantic and murderous civil war of modern times. This war, too, he saw end in secure peace, finally establishing as one of the great powers of the world a nation which at his birth hardly had an existence.

## EDGAR QUINET.*

FRANCE has lost in Quinet a writer whose genius and originality have never received their due appreciation in America. His essay on the Revolution throws a flood of light on some of the aspects of its topic. The book has been published for at least ten years; it has gone through more than five French editions; its pages are marked by the intellectual and moral sincerity, the poetic insight, and the high tone of spiritual rather than religious feeling characteristic of its author; but the essay has never been translated into English, and has not excited either here or in England half as much attention as the lengthy histories in which the fanaticism of Louis Blanc vindicates the humanity of the Terrorists, or the patriotism of Thiers offers most needless flattery to the genius of France. The causes of Quinet's failure to influence the American or the English public are not far to seek. Readers trained in the traditions of English literature and politics demand, and as a rule quite rightly demand, in their instructors what may be called the manner of good sense. Unfortunately, the salutary feeling in favor of plain, direct writing leads readers to fancy that nothing can be true which is not expressed in the form of commonplace, and that it is of even more consequence that an author should write sensibly than that he should write good sense. This sentiment or prejudice is constantly outraged by Quinet. A good deal of his essay reads like a series of detached epigrams and exclamations suggested by the events of the Revolution, and it needs both some insight and, still more, some sympathy with the writer to perceive that these sharp-cut, detached sentences embody a systematic view of the Revolutionary history, and that epigrams and exclamations often contain in a few words the results of long study and patient thought.

Nor is Quinet's mode of thought calculated to obtain from the mass of English readers that kind of sympathy which may remove the offence caused by his style. He represents a type of feeling and belief out of keeping with the tone both of the Liberalism and of the Conservatism which prevail in the nineteenth century. The central article of his creed is faith in spiritual and intellectual freedom. For material well-being and for schemes of which material prosperity is the main object, he cares as little as for the impressiveness of mere historical associations. The criterion by which the success or failure of a revolution must in his view be tested is the answer to the question, Has it freed the spirit of man? This is the test which he constantly in one form or another applies first to the Reformation and next to the Revolution. The result of its application in the hands of a man so clear-sighted and honest as Quinet could not be doubtful. The Reformation stands, the Revolution does not stand, his criterion. With all its defects and all its shortcomings, Protestantism wrought a great deliverance for the nations of Europe. With all its promise and with all its efforts, the Revolution has wrought no spiritual deliverance for France. Quinet saw this, and, with an honesty difficult for a Frenchman to practise, boldly pro-

* 'La Révolution. Par Edgar Quinet.' Paris: Librairie Internationale.

claimed to his countrymen that the Reformation had succeeded and the Revolution had hitherto ended in failure. This honesty and clear-sightedness would have been remarkable in an enemy of the Revolution. It is still more remarkable in a man like Quinet, filled with the keenest sympathy for the revolutionary efforts. The very love of spiritual freedom which made him deplore the failure of the Revolution to emancipate the spirit of France, made it impossible for him to deny how great at the outbreak of the Revolution was the need for freedom of all kinds, and how noble were the aspirations of the generation who believed themselves called upon to regenerate mankind. It is this sympathy with the higher objects of the revolutionary movement, combined with a profound consciousness of its failure to obtain them, which gives the special merit to Quinet's essay. He more nearly than any other writer with whom we are acquainted avoids the characteristic errors at once of English and of French critics of the Revolution. He does not on the one hand fall into the delusion originated by Burke and propagated by later writers without half his excuse, that a gigantic movement in which not France alone but the whole civilized world took more or less part, could be accounted for as an outbreak of human wickedness, violence, and folly. On the other hand, he refuses to exculpate the crimes of revolutionists or to indulge in the natural but harmful delusion that it cannot be that a movement which caused so much suffering should have failed in attaining the objects which alone made the suffering worth endurance. Hence Quinet, at any rate, perceives that the true problem presented by the Revolution to historical students is, how did it happen that a great movement, aiming at worthy objects, guided by men of genius, and commanding the sympathy of the civilized world, has ended in failure ?

To say that Quinet has supplied a complete answer to the riddle which was the constant occupation of his thoughts is to attribute to him a success which no one thinker has yet achieved, and which probably is unattainable. Nor can it be asserted that he has not, in the treatment of his great subject, fallen at times into errors peculiar to himself. But candid students who have not only read but have reflected on Quinet's work, will admit that he has thrown a flood of light on his subject, has dispelled inveterate traditional errors, and has called attention to aspects of history which have escaped even the acute analysis of such a writer as De Tocqueville. Quinet, in fact, deals successfully with exactly that side of history to which De Tocqueville, with all his acuteness, was, to speak the truth, blind. The author of the 'Ancien Régime' weighed and measured the political, the social, and, so to speak, material influences which both led to the revolutionary outbreak and influenced the course of the movement. But the religious aspect of the Revolution more or less escaped him. He saw that the church of the *ancien régime* differed in many respects from the church of modern France. He perceived that material causes had led in part to a change in moral character. All that he saw was true ; but it was not the whole truth, or the most important part of the truth. He did not see that there was an inconsistency between the spirit of Catholicism and the spirit of liberty. Devoted to freedom and devoted to the Catholic religion, the genius of De Tocqueville blundered at once in the domain of speculation as in the domain of practical politics. The man who opposed the Empire and abetted the expedition to Rome was naturally unable to perceive that one of the rocks on which the revolutionist made shipwreck was the inherent impossibility of establishing political freedom without carrying out a religious reformation. This idea which escaped De Tocqueville is the fact which haunted the imagination of Quinet. Half at least of the revolutionary errors originated, as he points out, in the inability of the revolutionists either to realize the nature of the "religious difficulty" or to suggest any mode of removing it. The assertion that men who seemed at one moment about to overthrow Christianity itself were timid innovators in matters of religion, appears at first sight a hopeless paradox. Few readers of Quinet will doubt that the apparent paradox is the summary statement of an indubitable fact. The revolutionists, from Mirabeau down to Robespierre, always hesitated to touch even in the least point matters of dogma. Under the easy pretence that "fanaticism was dead," as Robespierre stated at the very moment when a religious war was desolating La Vendée, they preached the doctrine, and to a certain extent practised it, that religious dogmas were unworthy of the attention of a statesman. To proclaim that Protestantism was a belief more compatible with freedom than Catholicism was, in their view, at once to show an unphilosophic interest in contemptible points of theological difference, and to exhibit an unstatesmanlike rashness in offending the prejudices of women and peasants.

The ground of this view is not hard to find. Men of all parties, Burke no less than Robespierre, shared the belief that there was no essential difference between the various forms of Christianity. The one might draw from this the inference that all religions were equally admirable, and the other that they were all equally contemptible. But that specific theological belief should influence decisively the course of national politics was an idea almost foreign to the men of the eighteenth century, who looked with philosophic calmness on the follies and fanaticism of the Reformation. This view of the insignificance of theological differences was closely connected with the belief that the mere proclamation of toleration for all creeds would without further effort remove every religious difficulty out of the path of statesmen. When facts showed that the enunciation of the doctrine of religious freedom would not work the miracles which it was supposed to be capable of effecting, the revolutionary leaders were at their wit's end. Persecutions, proscriptions, enforced oaths of allegiance, massacres of priests, desperate efforts to set up the worship of Reason, are all signs of the incapacity and violence of men who had met with an obstacle which they were unprepared to remove, because they had fancied it did not exist. To encourage actively a married priesthood, to introduce any scheme of reformed belief, to adopt Protestantism, and thus break finally with Rome, were measures which required a boldness and statesmanship not to be found in any one of the heroes of the Revolution. They guillotined priests because they did not know how to attack the spiritual foundations of hierarchical power. Nor, on the other hand, had the revolutionists that unwavering faith in the efficacy of freedom to remove all prejudices which might have enabled them to give at any rate a fair trial to the principles of toleration. Their fundamental want was a lack of belief in spiritual influences. They neither dared, like the Reformers, to proclaim "the truth," and enforce it at all risks, nor had they the faith of philosophers which might tolerate differences in the belief that perfect freedom would produce the victory of truth. The consequence was that, as Quinet points out, the revolutionists had the maxims of toleration on their lips, whilst their actual policy was a policy of cruel and aimless persecution. They incurred, therefore, all the odium due to persecutors without effecting any such revolution of national sentiment as persecution has sometimes indubitably produced.

That the revolutionists were utterly incapable of dealing with the religious difficulty, and that this difficulty was one which, grounded as it is in the opposition between Roman Catholicism and modern conceptions of freedom, no skill could elude, is as certain as any fact of history. To have shown the importance of this fact, and to have insisted on the necessity of recognizing it, is the great service which Quinet has rendered both to historical students and to practical statesmen. It would, however, be unfair both to Quinet himself and to his critics to conceal the fact that one great object of his historical speculation is to enforce a view as to the mode of carrying out religious reformation which is clearly intimated in the following characteristic sentences :

"Under the Christian emperors, when the moment came for snatching the people of Egypt from the religion of the Pharaohs, the whole nation stood in wavering uncertainty around the temples. A centurion stepped forth from the crowd, and with his hammer struck the first blow at the temple of Isis. The crowd followed, and finished what the centurion had begun. From that moment Egypt belonged to the modern world. The French Revolution lacked such a centurion."

The parable hardly needs explanation. The crowd, according to Quinet, never initiate a reform. They know the truth when it is proclaimed, and follow it. But it must be proclaimed in order that it may be known. There comes, moreover, a time when error must be treated as error. It is no good to talk of toleration at the commencement of a reform. The first step is to denounce falsehood. The centurion must strike even the temple.

The end of an article is not the place in which to examine Quinet's views on the relation between reform and toleration. His zeal for truth indubitably betrays him at times into something very like a defence of persecution. But it would take a very unfair opponent to deny that the fundamental sentiment of Quinet's writings is zeal for truth and a hatred of all attempts to suppress spiritual freedom by means of material force. The massacre of St Bartholomew, the revocation of the Edict of Nantes, the conversions enforced by dragoons, all the persecutions by which Protestantism was rooted out of France, are as hateful to him as the massacres at Lyons or the Noyades at Nantes, by which France was deprived of almost every chance of ever establishing the rule of rational freedom and just law. What he hates is not toleration, but that sort of sham religious liberty which, in the name of liberty, enables its sworn foes to root out all spiritual freedom. What he detests even more, and with even better reason, is the various pretences under which men proclaim with more or less circumlocution that in matters of religion there is no such thing as truth or falsehood. Quinet's protests, it must be remembered, against the false liberalism which veiled itself under the show of facile toleration, were uttered at a time when

French liberals thought they could find in the Roman hierarchy an ally in their struggle with imperial despotism, and statesmen thought that all religious difficulties might be met by the formula, "A free church in a free state." Quinet's policy may be mistaken, but credit for foresight at least must be given to the prophet who foresaw in 1865 the perils to freedom which in 1875 tax to the utmost all the skill and boldness of practical statesmen.

## RICHARD WAGNER.*

IT has always been a matter of surprise to us, in view of the undeniable and widespread interest which the musical works of Richard Wagner have excited in this country, that so little has been done towards making us acquainted with the literary and philosophical side of this composer. We have heretofore been content to take him too much for granted as an original and daring thinker, without troubling ourselves about what his original and daring thoughts were. His more important theoretical and controversial writings have now been quite long enough before the world to excite the curiosity, if nothing better, of our music-loving public, but we fancy that very few of us know more than their titles. This may be easily explained by the difficulty of Wagner's German, but that nobody should have yet given in a translation some of Wagner's writings is not so easily explained. His 'Beethoven' has been translated in America, to be sure, but the 'Beethoven' is one of the most abstruse works on æsthetic metaphysics that exist in any language, and can hardly be expected to serve as a favorable introduction to Wagner's art-philosophy. Mr. Burlingame's 'Art Life and Theories of Richard Wagner' is, therefore, very welcome. It is a translation of very judicious selections from Wagner's prose works, omitting his longer theoretical essays, but giving just enough to make the reader familiar with the author's life and habitual cast of thought.

One of the pet ideas in this country as well as in England seems to be that Wagner has written all his music on a new system, which he had previously painfully thought out according to newly-discovered metaphysical and philosophical laws. Yet we now find Wagner himself saying:

"'The Flying Dutchman,' 'Tannhäuser,' and 'Lohengrin' were written by me, their music composed, and all (with the exception of 'Lohengrin') performed upon the stage before the composition of my theoretical writings. I might therefore show you in them (if it were entirely possible from the nature of the subject) the course of development of my artistic production up to that point where I saw myself called upon to account to myself theoretically for my method of procedure. But I only mention this to call your attention to the error that has been committed in believing, with regard to these three works, that they were purposely composed according to the abstract rules I had laid down. Let me tell you rather that my boldest conclusions concerning the possible form of the musical drama were forced upon me by the fact that I was, at the very time I made them, carrying in my brain the plan of my great drama of the 'Nibelungen,' for a great part of which I had even written the poetry; and I had so developed it that my theory was little else than an abstract expression of the productive process that had formulated itself within me."

He has also been held up to public execration as the annihilator of melody; as a man whose own melodic impotence (so to speak) had led him to defame melody as frivolous and beneath the notice of thinking men, much as a certain fox despised certain grapes. But here we find him saying: "Let us establish first of all the fact that the *one true form of music is melody;* that without melody music is inconceivable; and that music and melody are inseparable. That a piece of music has *no* melody can therefore only mean that the musician has not attained to the real formation of an effective form that can have a decisive influence upon the feelings, which simply shows the absence of talent in the composer—his want of originality compelling him to make up his piece from hackneyed melodic phrases to which the ear is utterly indifferent." This certainly presents Wagner in a light new to many of us.

The most important chapters in Mr. Burlingame's book are undoubtedly the "Music of the Future" (which, by the way, must not be confounded with Wagner's much longer and more detailed essay, "Das Kunstwerk der Zukunft," which made so much noise on its first appearance in Germany), the "Purpose of the Opera," and the extracts from a letter on "Musical Criticism." Although these selections are far less exhaustive of the subject, and from a literary point of view inferior to Wagner's longer theoretical essays, such as "The Work-of-Art of the Future," "Art and the Revolution," and his "A Communication to my Friend," not to speak of his "Opera and Drama," they are most judicious for Mr. Burlingame's purpose, which seems to be to give the American reader a sufficiently comprehensive, bird's-eye view of Wagner's life and art-theories. The chapter on the production of "Tannhäuser" in Paris is interesting, inasmuch as it lets the reader into the secrets of dramatic success in the French capital, and shows by what a thread a composer's popularity may at times hang. Though a one-sided, it is nevertheless a perfectly credible account of the so-called failure of the opera in Paris. After speaking of the various demonstrations made by the audience on the opening night, Wagner goes on to say:

"The behavior of the audience on the evening of the second performance proved to me that I had not been mistaken in considering the result of this first evening to be a complete success; for by this it was decided with what opposition I was to have to deal in future—namely, with that of the Paris Jockey Club, which I am certainly authorized to name thus plainly, since the audience itself openly pointed out my opponents by the cry 'à la porte les jockeys.' The members of this club, whose right to consider themselves lords of the Grand Opera I need not now explain to you more fully, and who felt themselves deeply injured at the absence of the customary ballet at the time of their entrance to the theatre (about the middle of the performance), perceived with disgust that 'Tannhäuser' had *not* failed at its first reception after all, but had really won a triumph. From this time forth it became their business to prevent this balletless opera from being presented to them evening after evening; and for this purpose they had provided themselves, on the way from their dinner to the opera, with a quantity of hunting-whistles and similar instruments, with which they began, immediately upon their entrance, to operate against the 'Tannhäuser' in the most shameless manner. Until that time (that is, during the first and up to nearly the middle of the second act) not a trace of opposition had made itself felt; and continued applause had accompanied unhindered those passages of my opera that had most quickly become favorites. But from this point no further demonstrations of applause assisted me; in vain did the Emperor and Empress themselves a second time demonstrate their appreciation of my work. The irrevocable condemnation of the 'Tannhäuser' had been spoken by those who regarded themselves as masters of the theatre, and who all belonged to the highest aristocracy of France. Up to the very end of the piece, whistles and pipes accompanied every attempt at applause on the part of the audience."

The chapters on the "Love Veto," "A Pilgrimage to Beethoven," and "An End in Paris," throw a good deal of welcome light upon the composer's earlier life up to the time when he wrote his first grand opera, "Rienzi." The "Pilgrimage" and the "End in Paris," although insignificant enough as works of fiction, are pleasing from the frank, outspoken, youthful enthusiasm for what is high and noble with which they are filled. Now and then a touch of welcome wit or humor relieves their sombre grimness of purpose; but upon the whole they are little better than callow attempts at story-writing. We cannot, however, quite pass them by without a certain degree of interest when we think what want and suffering prompted the young author's pen. The two chapters on the performance of the "Freischütz" in Paris, and particularly the second, are excellent examples of Wagner's caustic wit and unsparing sarcasm. The chapters on the "Opera-House at Bayreuth" have a special interest now, and the "Legend of the Nibelungen" is a clear and concise narration of the somewhat complex plot of Wagner's great trilogy. The chapter of autobiography needs no comment.

Mr. Burlingame's translation is unusually good. When we consider the difficulty of rendering Wagner into intelligible English at all, we must give the translator the highest praise. His task has, indeed, been an exceptionally hard one. The book ends with a catalogue of the composer's published works and a very convenient index of names of noted men and places mentioned in the book.

*'Art Life and Theories of Richard Wagner. Selected from his writings and translated by Edward L. Burlingame.' New York: Henry Holt & Company. 1875.

*The Romantic Legend of Sâkya Buddha:* from the Chinese Sanskrit. By Samuel Beal. (London: Trübner & Co. 1875.)—This is not exactly a work to be classed with summer reading, but its romantic character invests it with many of the attractions of a novel, and not a few may find it much more enchaining than the tales which they take from the circulating library. A more agreeable introduction to the knowledge of a great religion and of the life of its founder could hardly be expected. The Oriental fault of repetition and exaggeration, pruned as it has here been by Mr. Beal, whose convenient "etc." slaughters whole pages of verbiage, is but a slight drawback to the pleasure one gets from the general narrative and from the numerous parables and histories, of truly Indian conceit; and it must of course be duly weighed in forming a just apprehension of Buddhism. The translator thinks that "the interest of the book will be found to result, not from any critical studies (which I would fain have attempted) found herein, but from the stories which throw light on contemporaneous architectural works in India"; and he accordingly makes frequent references to the plates in 'Tree and Serpent Worship.' The theological student will find in the preface and in the appendix an enumeration of some of the points in which

there is an external resemblance between Christianity and Buddhism. The question of precedence is broached, but not for argument or settlement.

The interest of the story of Buddha increases as it approaches the end, for it is there that one sees the founder compelled to restrain his followers with prohibitions and injunctions, all tending to build up an orthodox ceremonial and usage which would not have arisen from the mere preaching of the law. One of the most amusing chapters is that which tells of Buddha's attempt under difficulties to convert the unwilling and worldly Nanda, who, after he is "roped in," very much as the curious visitor to the camp-meeting is got in spite of himself on the anxious seat, makes a series of fruitless attempts to leave the brotherhood, each of which leads to a fresh rule of conduct from the founder; as, "From this time forth, let no Bhikshu presume to wear a garment of the same size as mine; or if he does, let him be dealt with as the law directs!" And again: "Brethren! from henceforth let none of my disciples wear a decorated robe, or use any unguents, or lightly hold his pâtra, and so go a-begging; whoever commits himself thus, let him be dealt with according to the law." We are tempted, on account of its *naïveté*, to give one of these incidents entire:

"Nevertheless, Nanda, though obliged to give up his beautiful robe and the other personal adornments we have named, could not forget the joys of his royal home and the delight afforded him by the company of Sundari; and so all day long in his retreat he did nothing but draw the figure of his sweetheart on a fragment of a tile, with a burnt piece of stick as a pencil, and delight himself with gazing at her from morning till night. Then Buddha, having been acquainted with the circumstance, assembled the Bhikshus, and solemnly warned them against any such misconduct as this, and forbade it under penalty of expulsion from the community."

There are numerous passages which we should like to quote for their beauty, like that telling of the thirty young men in search of a dancing-girl who had stolen off from one of their number in the night, with the jewels and other light property of the party. They come suddenly upon Buddha under a tree, and are startled into conversion by the Socratic or Christian enquiry: "Whether is it better, think you, to find yourselves, or to find this woman whom ye seek?" They replied: "It would certainly be better to find ourselves." This, too, may be cited for its delicacy. A woman has just brought the tidings of the birth of Sâkya Buddha:

"At this time the great minister Basita loosed from his neck the string of precious stones that he wore, and gave it to the woman, because of the news she brought; but having done so, again he thought, 'This woman, perhaps, is a favorite of the king, and his majesty, seeing her so beautifully adorned, will naturally enquire and find out where those pearls were obtained, and so it will cause trouble.' So he took back the gems, and desired that whatever merit would have attached to the gift might redound to the woman's benefit."

The 12th School-year will begin Sept. 30.
A University Professor has charge of the highest class
Mrs. Reed's address until Sept. 10 is Navesink, N. J

*MRS. J. T. BENEDICT'S Boarding and Day* School for Young Ladies and Children, No. 7 East Forty-second Street. Will reopen Sept. 30.

*MRS. WILLIAMES, assisted by Miss Cruttenden*, announces the eighteenth year of her English and French Boarding and Day School for young ladies and children, at 26 West Thirty-ninth Street. Prompt attendance is requested on Thursday, September 23.

*NESHANIC (N. J.) INSTITUTE.—Collegiate* School for Boys. Rev. P. D. OAKEY, Prin. Sept. 15.

*NEW BRITAIN (Conn.) SEMINARY for* Young Ladies. Address D. N. CAMP, Prin. Autumn term begins Sept. 7.

*NEWBURGH INSTITUTE—A Family* School for Boys—will reopen Sept. 14. For circulars, address HENRY W. SIGLAR, Newburgh, N. Y.

*PACIFIC THEOL. SEM., Oakland, Cal. Year* begins Aug. 20, ends in May. Address Prof. J.H BENTON

*PEEKSKILL (N. Y.) MILITARY ACA*demy. New Gymnasium. $400 per year. Opens Sept. 8. Address WRIGHT & DONALD.

*PENNSYLVANIA MILITARY ACA*demy, Chester, Pa. Opens Sept. 8. Civil Engineering, the Classics, and English thoroughly taught. For circular apply to Col. THEO. HYATT, President, or O. M. BOGERT, No. 1 Nassau Street, New York.

*PREPARATION FOR COLLEGE. Prince*ton High School, Bureau Co., Ill., will fit pupils thoroughly for the best colleges. For catalogues, address HENRY L. BOLTWOOD, Principal.

*RACINE COLLEGE.—The School of Letters*, the Scientific School, and the Grammar School of Racine College will reopen Wednesday, Sept. 15. The restoration of Taylor Hall, with many improvements, and a new Laboratory and Gymnasium, which are to be finished before the term opens, will add much to the advantages of the institution. For admission apply to Rev. JAMES DE KOVEN, D.D., Racine College, Racine, Wis.

*ROCKFORD (ILL.) SEMINARY for Young* Ladies. Address Miss ANNA P. SILL, Principal. Twenty-fifth college year opens Sept 23.

*ROCK HILL COLLEGE, Ellicott City, Md.* Under the care and management of the Christian Brothers. Rare opportunities are afforded to the student desirous of fitting himself for Civil Engineering, Mercantile, or Literary pursuits. Studies resumed Sept. 6. BROTHER BETTELIN, President.

*RUTGERS FEMALE COLLEGE, 489 Fifth* Avenue, reopens Sept. 29. THOS. D. ANDERSON, D.D., President.

*SCHOOL OF MINES, University of Michigan.* Examination for admission, Sept. 23. Fees: To residents of Michigan, $25 for the first year; $15 for each subsequent year. To all others, $45 for the first year; $20 for each subsequent year. For circulars, address H. D. BENNETT, Steward, Ann Arbor, Mich.

*SCHOOL FOR GIRLS AT PORTSMOUTH*, N. H. Miss A. C. Morgan, Principal. Fall Term begins September 24. French and German by native teachers residing at the School. Best of instruction in music and drawing. References—Rev. A. P. Peabody, D.D., Cambridge; Hon. Wm. T. Davis, Plymouth, Mass.; ex-Gov. Goodwin, Portsmouth. Send for circulars.

*SHATTUCK SCHOOL (Military Boarding)*, Faribault, Minn. $350 a year. Opens Sept. 16. Send card for catalogue. Bishop WHIPPLE, President; Rev. J. DOBBIN, A.M., Rector.

*STAMFORD, Conn. Professor G. B. Glan*dining's Boarding and Day School for Boys will reopen September 1, 1875.

*STAMFORD MILITARY INSTITUTE.* Twenty-sixth year begins Sept. 15. Send for catalogue to WILCOX & FLINT, Principals, Stamford, Conn.

*ST. JOHN'S FAMILY SCHOOL FOR* Boys, Manlius, N. Y. (near Syracuse). Under the personal supervision of the Rt. Rev. T. D. Huntington, S.T.D.; with Judges Comstock, Andrews, and others as Trustees; and an able Faculty, including Dr. Hubbard, late of Chapel Hill University, N. C. ☞ Opens Sept. 15. For circulars and information apply to the Rector. $400 per year. Rev. THEO. BABCOCK, D.D., Rector.

*ST. LOUIS LAW SCHOOL opens October 13*, 1870. Address GEORGE M. STEWART, Dean, Third Street St. Louis, Mo.

*ST. MARY'S HALL, Faribault, Minn.—Rt.* Rev. H. B. Whipple, D.D., Rector, Miss S. P. Darlington, Principal, assisted by a full corps of experienced teachers. The tenth school year will commence on Thursday, September 16, 1875. For registers, with full details, address the Rector.

*THE DIOCESAN SCHOOL FOR BOYS*, Reading, Central Pennsylvania. The Right Rev. Dr. Howe, Rector; the Rev. J. Everett Johnson, M.A., Chaplain and Head-Master, with competent assistants. The Christmas Term will commence on Tuesday, September 14. For circulars, etc., address the Bishop or the Head-Master, at Reading, Pa.

*THE SISTERS OF ST. MARGARET, Bos*ton, at the request of several of their friends, propose to open a Boarding and Day School for Young Ladies at the west end of the city. The school year to commence September 24. Applications to be made to the MOTHER SUPERIOR, 1581 Washington Street, Boston.

*TRINITY BOARDING and DAY SCHOOL* for Boys, New Brighton, Staten Island, N. Y., on high ground, facing the Kills, and in most healthful neighborhood. Opens Sept. 15. JOHN M. HAWKINS, A.M., Principal.
*From Hon. George William Curtis.*
"I have very great pleasure in stating that Mr. John M. Hawkins is personally known to me as a most faithful and admirable teacher, thoroughly competent to prepare young men to enter any college in the country. July 11, 1875."

*UNION UNIVERSITY. Albany Law School.* The course of instruction in this well-known school commences on the first Tuesday (the 7th) of September. Apply for circulars to ISAAC EDWARDS, Albany, N. Y.

*UNIVERSITY OF MICHIGAN. Medical* Department. The session of 1875-6 will commence Oct. 1, 1875, and continue for six months.
A course separate, but equal, for women.
Fees: To residents of Michigan, $25 for the first year; $15 for each subsequent year. To all others, $45 for the first year; $20 for each subsequent year.
For circulars, containing full information, address
A. B. PALMER, M.D., Dean of the Medical Faculty,
Ann Arbor, Michigan.

*UTICA'S SCHOOL for Young Ladies, Utica*, N. Y. Fall term begins Sept. 15. Mrs. PIATT, late of Norwich, Ct., Principal.

*WASHINGTON and LEE UNIVERSITY*, Lexington, Virginia. Academic, Engineering, and Law Schools. Session commences Sept. 16, 1875. For catalogue, address Gen. G. W. C. LEE, President.

*WESLEYAN FEMALE COLLEGE, Wil*mington, Delaware. Next session will begin Thursday, Sept. 9. The best facilities are afforded for acquiring a thorough education, under home-like influences, at reasonable expense. For catalogues, address Rev. JOHN WILSON, A.M., President.

*WILLIAMS COLLEGE, Williamstown*, Berkshire Co., Mass. Every facility for thorough college education. $6,000 given annually to aid indigent students. Next term will begin Sept. 8. For catalogue or additional information, apply to P. A. CHADBOURNE, President.

*WOMAN'S EDUCATION ASSOCIATION*, Boston. Examinations for Women. The third examinations for Women by Harvard University will be held in Boston or Cambridge in May, 1876, under the charge of this Association. Notice of intention to be candidates must be sent to the Secretary on or before April 1, 1876. Circulars of explanation will be sent free to any address, and a pamphlet containing complete details, with specimen examination papers, will be forwarded upon receipt of twenty-five cents. Exact notice of the place of examination, and also of the time (day and hour), will be sent to all candidates on April 15, 1876. Address SECRETARY OF THE WOMAN'S EDUCATION ASSOCIATION, 68 Beacon Street, Boston, Mass.

# The Nation.

*NEW YORK, THURSDAY, AUGUST 26, 1875.*

## The Week.

THE Baltimore *American* gives what is certainly a very plausible explanation of the negro "insurrection" in Georgia which has just failed to come off. On the 20th of this month, it seems, the blacks of Burke County were to have held a meeting at Waynesboro to discuss a new registry law which the Georgia banditti have recently passed, and which is supposed to discriminate against them by requiring the payment of taxes before they can be enrolled as voters; the blacks, apparently, being unfamiliar with the political axiom of no representation without taxation. They have also been irritated at their exclusion from juries. This meeting was to have been addressed by one Morris, described as something of a politician and also a "general," self-appointed. Just before the day, however, somebody announced that he had discovered an order addressed to a "Captain" Walters, signed by General Morris and another general named Rivers (a South Carolinian politician, who himself protests his innocence, and declares that it takes so much of his time to "give his attention to his corn and cotton" that he has none left for military operations across the border), directing a general massacre of the male whites and the ugly women. There was now a terrible commotion in all the telegraph and newspaper offices in Georgia, and the White League demanded that the eight military companies at Augusta should be led at once to meet the foe. The officers telegraphed to the Governor of the State for permission to do this; but he told them that they might stay at home, and he himself started off alone to the scene of hostilities. The news of his approach struck terror into the hearts of the negroes, who immediately stopped preparing to massacre the whites, and in a few hours the only traces that could be found of the insurrection were several jailfuls of "ringleaders" arrested on suspicion, and swampfuls of followers who had run away to escape the vengeance of the whites. The bodies of the male whites and the ugly women can nowhere be found, and, as a massacre, the affair may be said to have been a failure. The meeting on the 20th, however, did not come off.

---

Mr. George H. Williams must feel, if he preserves any of his old interest in the fortunes of the oppressed negro, that the whole business has been shockingly mismanaged. Here is an insurrection of negroes ground down and oppressed by Democratic tyranny, in a part of the South where Republican sentiment is much needed, and in a part of Georgia where the negroes outnumber the whites; and yet, on the eve of a Presidential year, no sort of use is made of these promising materials by the Department of Justice. With a few troops and an enterprising commander sent down from Washington, the insurrection might not only have been kept going for a month or two, but it might easily have turned out that a searching investigation would have shown it to be not a negro uprising, but a Democratic plot to murder the negroes; and with a little court-martialling and telegraphing, the Northern heart might have been once more fired to a point at which the repeal of the habeas corpus next winter would seem the chief necessity of these awful times. And all this thrown away by the sluggishness of Mr. Pierrepont and General Grant! We hope the Republicans will not overlook the fact that bogus negro insurrections are the natural and inevitable fruit of bogus "outrages," "banditti" despatches, and lawless subversion of civil powers by troops, and that in the long run it is the poor negro himself who pays for all his friends' excesses. Now that the Administration, after setting the South the political example which it did in Louisiana, has taken its hands off, we shall probably find that the South has profited by the example, and learnt all the tricks of the trade.

---

The "new party" so long talked of has at last been founded—this time in Boston. It met at the Parker House in that city on Saturday last and began operations. The person whom the committee seemed most anxious to have present on the occasion was Mr. N. P. Banks, and indeed it is rumored that he is to be "the standard-bearer" at the next Presidential election. He expressed his sorrow that he could not be there on that day; his approval of the whole thing; his joy that so many soldiers and sailors were going to be mixed up in it—in fact, he did not see how the views of the army and navy at the North and South could be resisted; demanded "patriotic and harmonious action"; was flattered to think of his name being connected with the movement, but really does not wish to be President, and does not think it best to try to elect him; thinks it would stand in the way of "harmony"; is willing to work and co-operate and harmonize with almost anybody for anything, but sternly reserves to himself one right (which, however, he "freely accords" to others also), viz., that of "voting for those best able to secure the changes universally demanded." Judging from the above account of himself, Mr. Banks must be a truly good man, but we agree with him in thinking that it would be unwise to make him President just now.

---

The platform of the new party is an exhaustive and virtuous document. It declares that business is dull, prices low, "labor a drug," and fraud very common; that further support of either of the existing partisan organizations would be dangerous because "it keeps in sight ghosts of issues long since dead"; that "the time has fully come when the people should resume their sway" (how often that time has come, and almost always about this season); that dishonesty in public office is a heinous crime; that public officers should be careful of the public money; that luxuries should be taxed and not necessaries; that Government should build its own vessels, and make its own guns and ammunition; that great combinations and corporations should be looked after; that farmers and manufacturers should receive what they earn; that the nation should keep its promises; that there ought to be neither sudden inflation nor contraction, but that "the nation's notes ought to be made as valuable as the notes of prosperous and honorable individuals"; that for the good of trade there ought to be no enmity between North and South. We will respectfully suggest, as additions to this platform, the following: True happiness is only to be found in the practice of virtue; the longest way round is the shortest way home; many a little makes a muckle; it's an ill wind that blows nobody good; the proof of the pudding is in the eating; and money makes the mare go. If the Committee, too, will ask the illustrious Banks what it is that makes the "notes of prosperous and honorable individuals valuable," he will tell them that it is the belief that "prosperous and honorable individuals" will pay them in gold, on demand, or at maturity, so that what the Committee meant, if they meant anything, in their windy resolution about the currency, was that "the only consistent method for the resumption of specie payments" was to redeem the Government promises in coin.

---

The Ohio canvass grows more lively if not more interesting, and there seems to be a comfortable feeling among the Republicans that the Democrats have hopelessly lost ground, and have suffered more damage from their own champions than they have from the attacks

of their opponents. A "question of veracity" has been raised between a newspaper reporter of the Cleveland *Leader* and Senator Thurman and the Hon. Theodore Cook. The former professes to have "assisted," as a sitter-by in a public place, at a conversation between the two politicians which was as unreserved as if an interviewer in plain clothes were not within a thousand miles of them. They spoke very disconsolately of the prospects of the Democratic party, and very disparagingly of Gen. Cary, and of the priests for their meddling with politics. All this is denied by the two gentlemen; but the reporter, though roundly denounced as an eavesdropper, sticks to his story. The pleasant family excitement caused by this publication seemed to furnish a good opportunity for inventing a rumor of Gov. Allen's intention to withdraw from the contest, which evoked from the maligned candidate a classic burst of indignation and scorn. Gen. Durbin Ward, another Democratic light, has been making an old-fashioned hard-money, anti-inflation speech, and to the same effect talks Senator McDonald, of Indiana, who is following up the trail of his colleague, Senator Morton. But his yoke-fellow on the stump, one Cunningham, invariably succeeds him with a soft-money speech. McDonald is indiscreet enough, as regards the Republicans, to preach State sovereignty in its naked severity, and to endorse the Geghan Bill, which has raised the religious issue in this canvass.

---

Wall Street is mainly occupied in estimating the result of the year's crops, upon which the value of all corporate investments must be largely dependent. The merchandise markets, also, are in some measure held in suspense pending the settlement of the same question. The critical condition of the crops in some parts of the country, however, and the fickleness of the weather everywhere, make it unusually difficult to reach a satisfactory solution of this cardinal problem. As to the West, it is generally concluded that the injury from the rains and floods in the Ohio Valley is much less than was at the time anticipated; but now come in new doubts, suggested by the early appearance of frost in the Northwest. The general tenor of the best information from the South leaves no room for doubt that the earlier anticipations respecting the cotton crop will not be realized; but, as the conditions now stand, it is considered that 4,250,000 bales may be counted upon, provided the weather continues favorable. In spite of the doubts on these points, a very fair amount of business is being transacted with the Western and Southern States, and the railroad companies report an excess of West-bound freights over this period in 1874. A feeling is coming over all the markets, commercial and financial, that we have now reached a point at which the recovery of business cannot be much longer delayed, and this conviction itself can hardly fail to promote an improvement. The gold premium follows very closely the course of the foreign exchanges, which have assumed an easier tone upon the prospect of a pacific settlement of the Herzegovinian difficulties. The ease in the London money market favors the operations of the United States Loan Syndicate, their sales of the new fives being constantly in advance of the five-twenties turned into the Treasury, and there is every probability that all the five per cents authorized will be marketed before the expiration of the contract between the Treasury and the Syndicate.

---

Mr. McCulloch, in his last letter to the *Tribune*, tells a somewhat amusing story of the way in which he soothed the fears of those who thought his contraction of the currency, under the Act of 1866, would produce a panic. He was withdrawing greenbacks at the rate of $4,000,000 a month, and was receiving reports from New York as to its effect on the money market. These were somewhat unfavorable, and finally culminated in distinct warning that "if the next monthly instalment showed that the usual curtailment had been made," there would be a panic with all its attendant horrors. Accordingly, he sent for General Spinner, and told him that he was to keep the greenbacks withdrawn for the month in his hands—uncancelled, it is true, but still withdrawn from circulation as if they were cancelled—but to enter them in the next monthly statement as "cash on hand." The result was that Wall Street was reassured, and things went on swimmingly. This incident illustrates very usefully the largeness of the moral element in panics, and the extent to which the post-panic "economy" is a craze. A Wall-Street man, possessed by the ordinary ideas of the Street, for instance, would have "cut down his expenses" every time he saw that Mr. McCulloch had withdrawn $4,000,000, but would have launched out again when Spinner called the $4,000,000 "cash on hand."

---

The newspapers are printing some comparative statistics of the crime in this city in the years 1868 and 1872. From these it appears that while there were in the first year 144 burglaries, there were in 1872 459; grand larcenies increased from 332 to 1,503; assaults, from 3,027 to 7,323; petty larcenies from 1,149 to 5,506. It is not stated, however, whether these figures represent the number of crimes committed or the number of arrests made; in the one case, of course, they would be an indication of a steady increase of crime down to 1872 (statistics for the succeeding years do not seem to be attainable); in the other, they might also be explained in part by the increased vigilance of the police, owing to the constant efforts at "reform" always being made by every member of the Police Board. We hope that Mr. Wickham, however, will not allow himself to be led away from the main question, which is the character of the present Board. Whether crime is increasing or decreasing in New York in any particular year is of no consequence, for we know that with such creatures as Matsell at the head of the police it is a mere question of time. The inference of the consequences which must necessarily ensue from Matsell does not belong to any empirical or inductive branch of science, requiring an accumulation of evidence to be established; it is a "deductive" problem. Matsell being given, what must follow in any city which makes him chief of police? The intelligent citizen knows the answer at once.

---

No one seems to have noticed the close analogy that exists between the Baker case in England and the Tweed case in New York. As a number of appeals and counter-appeals have just been taken from orders in the Tweed suits, it may be worth while to call attention to this. Tweed, it will be remembered, was sentenced to twelve terms of imprisonment of a year each, for a number of separate misdemeanors, and the Court of Appeals upset the sentence as being "cumulative" in its nature. The judges did not seem to regard the trying of the indictment as in itself so much out of the way as was the cumulative nature of the judgment. It was an outrage, they said, that any man should be subject to a punishment so enormous for a simple misdemeanor. But the chief reason they gave for thinking so was that if a man were tried at once for several misdemeanors he would lose his right to his peremptory challenges, and the jury would be biassed in the consideration of one count by the evidence under another. If this is good law, Colonel Baker must regret very much that he is not a citizen of New York. If he were, he would be apparently entitled to his habeas corpus at once. He was convicted for a misdemeanor, and sentenced accumulatively; but the indictment embraced also a count charging him with a felony, so that the poor martyr was actually tried at one and the same time for two entirely different offences, by the same jury, and is now languishing in jail, when it is just as likely as not that the jury confounded the two charges, and, if they had clearly understood the difference between the two, might have acquitted him altogether. This may be British law; but what an awful illustration of the brutality and ignorance of the British, if such be the case. If the Prince of Wales, who is reported to be a great friend of Colonel Baker's, really wants to get him out of jail, he

had better send for a certified copy of the decision in Tweed's case. If the sight of it does not bring a blush to the cheek of every judge in England, we are mistaken.

---

A very interesting case has occurred in England illustrative of the moral responsibility of insane persons or persons professing to be insane. A man named Blamfield murdered a fellow-workman with an adze and has been convicted, but pleads insanity. He had been before the crime actually confined in a lunatic asylum. Dr. Kirkman, a well-known alienist, who had charge of him while there, reports that while under his care he undoubtedly was insane, but was in the habit of assaulting his brother lunatics. On being remonstrated with, he informed the Doctor that if interfered with he would murder him (the Doctor). Being told that if he murdered he would be hanged, he answered promptly: "Oh! no; as I am a lunatic I am not responsible for my acts; and if I do commit a murder you cannot punish me for it, because it is contrary to law to punish an insane man." To the argument that if he was capable of reasoning about the matter in that way, he was at least responsible to Almighty God, and that if he committed such an offence he ought to be punished, he replied: "I know that; but you cannot punish me whatever I do." The Doctor adds that he was constantly using threats of this kind to everybody about him, but that though he frequently assaulted harmless patients, he was never known to assault anybody "who he knew would return the blow with interest." This certainly is an important penological fact. The Doctor, having thus discovered that he was alive to consequences, told him that for every blow he gave anybody his tobacco would be stopped for one week, whereupon the assaults totally ceased. Here, therefore, was an undoubtedly insane man, the victim of extraordinary hallucinations on some points, and with a well-marked love of battery, who knowingly calculated on legal impunity, but showed the keenest sensibility to punishment, and who, as soon as he was discharged from custody and was sure of exemption from legal responsibility, committed a murder. The affair throws some curious light on the doctrine of "uncontrollable impulse."

---

Dr. Kenealy is not prospering with his defence of English liberty. He took his son, who rejoices in the Turkish name of "Ahmed," down to the borough of Hartlepool, and presented him to the electors as a worthy champion of the rights of man, but he only got 269 votes out of a voting constituency of over 3,000. The Doctor has also had bad luck in the House of Commons, where he called attention to the lightness of the sentence on Colonel Baker as an illustration of judicial partiality to the "upper classes," and complained that he had not been condemned to hard labor. Whereupon Colonel Dickson reminded the House that similar consideration had been shown to Dr. Kenealy himself by the Queen's Bench in 1850, when he was sentenced to one month's imprisonment for maltreating his son. This reminiscence was evidently a severe blow to the Doctor, and he rallied under it with difficulty. The sentence on Baker is twelve months' imprisonment and a fine, which may seem light on the surface, but it entails the close of his military career, or, in other words, social and professional ruin, and this to a man of fifty is almost as bad as death. Baker leaves the army as a matter of course, but there appears to be some question as to whether he ought to be allowed to resign. He tried to settle the point in his own favor by sending in his resignation on the day of the trial. If he were in Washington, he would be allowed to hold his commission until the newspapers had stopped talking about him, on the ground that he was "under fire," and then he would probably be sent abroad as an inspector of consuls or a special agent of the Treasury to find out, in Paris, St. Petersburg, Berlin, Vienna, and other large capitals, who the principal American smugglers were.

A report has been made to the British Treasury by a Committee appointed to examine the working of the Government postal telegraph. They discovered that the annual profit had been steadily diminishing ever since the lines came into the hands of the State, until now there is hardly anything left to pay interest on the large amount given to the companies by way of compensation. That is, the working expenses have risen from 57 per cent. to 96⅞ of gross receipts. An analysis of the report by the *Economist* gives as the causes of this the greater salaries paid to the Government officers who manage the lines than the companies paid to theirs, the large supervising staff employed by the Government, the sums paid by way of compensation to old employés of the companies who necessarily lost their places when the lines were transferred to the Government, and, though last not least, the greater number of facilities granted the public by the Government than by the companies. The *Economist*, however, thinks the state of things likely to improve as time goes on. The offices which now do not pay expenses—449 out of 3,692—will undoubtedly diminish as business increases, and more work can be done by the existing staff everywhere; many of the expenses, too, which are now loading the debit side of the balance-sheet are essentially expenses of beginning, and will hereafter diminish or disappear, while various economies may be made which experience has pointed out. How rapidly business does increase is shown by the fact that the gross income, which was $3,489,000 the first year of Government administration, was last year $5,600,000. The report has a good deal of interest for us, apropos of the efforts which have been made of late years to hand the telegraph over to the Post-office in this country, and it is easy to see, judging from English experience, what difficulty we should have, in our more sparsely settled territory, in preventing a very heavy deficit every year if the business were transferred to "the best civil service on this planet."

---

The news from Turkey is not more definite than heretofore. The friends of the insurgents deny they have been worsted, and the Turks continue to pour troops into Bosnia. The excitement in Servia and Croatia is said to be increasing, and it probably will increase until the day of the fighting, but there is no probability that it will be allowed to increase to any inconvenient extent. It has to be borne in mind, in speculating about the matter, that the Christian population in Herzegovina is comparatively small. There and in Bosnia the bulk of the inhabitants are Mussulman, though not Turkish—that is, the Mussulmans are the descendants, and often not very remote descendants, of Slavonic converts, and they are accordingly in one sense rather formidable insurrectionists. That is, they are used to arms, and have as much pride and self-confidence as the Turks, but then, on the other hand, they cannot count upon and do not care for the sympathy or assistance of the Servian or Austrian Christians, and do not get it. In spite of this, the Bosnian revolt in 1851-2 was a formidable one, because it was mainly Mussulman. If the population of Bosnia and Herzegovina were principally Christian, the Porte could probably hardly have held them until now, lying as they do in a sort of enclave between Servia, Dalmatia, and Montenegro. If the present rising be, as seems likely, Christian, its chances of much success are for the same reasons very small, because the majority of their neighbors will side with the troops, and the Mussulmans in these regions are very fanatical. As might have been expected, it is now reported that the three Eastern powers who have taken charge of Turkish affairs have warned Montenegro and Servia not to interfere, and have agreed that the Eastern question shall not be raised just at present. The news a few days ago caused a brief panic in Turkish securities on the London Stock Exchange, and, by one of those odd instances of association which the Stock Exchange only is capable of furnishing, it reached those of Egypt also (probably because Egypt is also a Mussulman power), and showed itself before the close in all the semi-barbarous stocks and bonds.

## THE DISTURBANCE IN TURKEY.

RUMORS of insurrection in Turkey are always to be received with considerable distrust, for the simple reason that we never hear or can hear more than one side of the story. The Turks have not only no friends in Europe, but they are cut off from all the ordinary modes of communication with the European public. They have no press; they are constitutionally reticent; their language is practically unknown outside their own territory; and they are complete strangers to European manners or modes of thought. Consequently, their version of their domestic troubles is never set afloat, or, if it is, it is carried eastward, not westward. It makes its way to the bazaars of Ispahan and Herat and Bokhara, but not to the press of Berlin and London and New York. On the other hand, the Christian population of the empire is in close relations, social, political, or religious, with millions of sympathizers all along the frontier, from the Adriatic to the mouth of the Danube. If it attempts resistance of any kind to Turkish domination, it has on its side the prayers and money, and often the arms, of the borderers in Montenegro, Dalmatia, Croatia, and Servia, who fill the Austrian and Russian press with stories of its sufferings and its prowess, and of the straits to which the Turkish Government is reduced. They magnify the fights, multiply the victories, and paint the atrocities of the struggle in dark colors, and this not through fellow-feeling simply, but in support of a well-settled policy. All the Christian subjects of the Porte, all who were once its subjects, hate the Turks with hereditary hatred—a hatred so deep and so full of savage memories that no justice or moderation in the Government now could abate it; but they think, from the experience of Greece and Montenegro and Servia, that if they could only support a rebellion long enough they would be sure to call down the interference of the great Christian powers and perhaps achieve their independence, or at all events achieve something which would enure to the damage and discomfiture of their ancient enemy. Consequently, they always support any insurrectionary fighting there may be with such stories as to the nature and extent of the revolt as may seem likely to stir up public opinion in the West, and produce the impression that a catastrophe of some kind is impending in Turkey, knowing well the extreme sensitiveness of the three great Eastern powers on this subject. Turkish risings, therefore, are rarely more than one-third intended for the Sultan, they are two-thirds intended for the Christian public of the West.

What the rising in Herzegovina amounts to, it is, therefore, very difficult to conjecture, but it is quite safe to believe that its proportions have been greatly exaggerated. With the Turkish army as efficient and as numerous as it is now, an insurrection in the western provinces has little chance of success unless it gets large assistance from over the border, and this it cannot get as long as the three Christian powers at the East are not ready for the break-up of the Turkish Empire, and that they are not ready now everybody knows. When they are ready, however, it is not in the least likely that they will suffer it to be brought about through insurrection simply. The day when a struggle like that of the Greeks, or even of the Servians, was possible is long past. Christendom has been brought into too close relations with Turkey for either Austria or Germany or Russia to suffer a war of races or of religions to reach dangerous proportions within her territory.

On the other hand, there are few signs of Turkish revival. The Government has been fairly given up as hopelessly rotten, even by its best friends in the West. The London *Times* and *Economist*, representing the two influences which helped the Porte out of the slough both in 1853 and 1874, have denounced it in good set terms as beyond salvation, inasmuch as it has fallen into the unpardonable sin of financial disorder. The finances were really in greater disorder twenty years ago than they are now; but then Turkey did not belong to what is called "the debtor class"—that is to say, she collected a good deal of money, and spent a good deal, and published no financial statement, but she owed nothing. She began borrowing in 1854, and has kept at it steadily ever since, until she has accumulated a debt of $1,000,000,000, which charges her revenue with $50,000,000 annually—not a too serious burden for a country with its population and resources if its society were homogeneous and the government decently administered. But then, unfortunately, the money has been nearly all put into military and naval preparations and into palaces for the Sultan—a sort of outlay which is not reassuring to creditors; and the revenue begins to show a regular yearly deficit, which has to be filled up by fresh loans. There would probably be more patience in Western Europe with the armaments if anybody believed they would count for much in case of a general war. In that case, such powers as expected to get Turkey as an ally might encourage or apologize for them; but nobody seriously expects the Turkish army or navy to exert an appreciable influence on the fate of the empire whenever any great crisis in its affairs comes. Its solution will then depend, as everybody knows, on the German or Russian or Austrian army, or on the English fleet. The causes of this insignificance of Turkish armaments, in spite of the high military qualities of the troops, are numerous; but the principal ones are the poor quality of the officers, and the absence of any class from which good ones can be drawn, and the general loss of faith on the part of the people that the Crescent can for any great length of time hold its ground in Europe. Confidence in one's ability to win is almost an essential condition of successful fighting, and from the Turks it has long ago departed. The migration of the Mussulmans from all parts of European Turkey across the Dardanelles into Asia Minor has now been going on steadily for forty years, and increasingly during the last twenty; and of course the more the Mussulman element in the population declines, the more anomalous and difficult the position of the Government in its European provinces becomes. The public debt, like many of the debts contracted during the last quarter of a century by semi-barbarous states, has been made possible by telling wonderful stories on the London Exchange about the resources of the country, the average investor not yet having got it into his head that the security for loans to "sovereign states" has to be mainly moral—that is, that the character of the people and the quality of the government are of vastly more financial importance than the nature or amount of the products of the soil. Most of the national swindling is done by compiling statistics about coal, iron, lead, grain, cattle, and guano, and avoiding all mention of the morals of the legislature, and the judiciary, and the tax-collectors, and voters—if voters there be. The promised Turkish reforms of late years, such as the famous one proclaimed by the Hatti-Humayoun after the Crimean war, are not carried out, and cannot be, for two reasons: one is the defective condition of the civil service, which afflicts the central power with a sort of paralysis; and the other is the unwillingness of the Christians to be worked into the governmental machinery along with the Turks. They do not want to form a modern state in unison with their old masters. They are not willing to help them in the work of reform and regeneration. They prefer to take their chance under the old system of quasi-independence, with chiefs of their own faith, and yet there is little doubt that if they chose to accept frankly and make the most of the chances which Turkish legislation now offers them, they might before long work their way into control of the Government. Their absolute refusal to serve in the army, for instance, is a positive boon to the Turks; while a demand on the part of the Christians for military service would put the Government in peril. The whole problem is one of which it is impossible even to guess at the solution. It will probably come through some tremendous accident.

## THE LIMITS OF CONSTITUTIONAL REFORM.

THE first thing likely to strike any one who examines the new Missouri constitution is its extraordinary length. It is four times as long as the Constitution of the United States—an instrument which has for a century answered all the purposes of a fundamental law for a confederation of communities at no time less than thirteen in number, and now amounting to some forty, with a popu-

lation twenty times that of Missouri. Since the original adoption of this Constitution there have been only fifteen amendments added to it, and eleven of these were adopted almost simultaneously with the Constitution itself; we may, in fact, really say that, in a hundred years, the only additions to the instrument have been the Thirteenth, Fourteenth, and Fifteenth Amendments—three short clauses which hardly do more than recognize and give legal validity to the social changes brought about by the war, and which might all be printed on a single page. But while the Constitution of the United States has thus remained practically unchanged, the additions to the State constitutions have been very voluminous, and they still go on increasing. The Constitution of the United States and the early State constitutions contain little more than an enumeration and division of the powers between the central and local governments, and certain fundamental maxims of English law, taken from Magna Charta or the Bill of Rights, and intended as checks upon arbitrary power. The modern constitutions have supplemented these, as we have often pointed out, by checks on the dishonest use of power, which, in these latter days, seems so much more common and dangerous than tyranny. It is by the addition of long clauses restricting the number of subjects which the legislature may deal with, and prescribing the manner in which legislative proceedings must go forward, limiting the power of towns, counties, and cities in the creation of debt, and those of railroads, that the proportions of these instruments have been so swollen. The Missouri legislator of the future, for instance, will find that the constitutional reformers have taken just four times as much trouble to prevent his lying, cheating, stealing, and perjuring himself as they have in the case of the governor. They have four times as much confidence in the modern representative of the old-fashioned tyrant as they have in the protector of society, the leader of the people. In view of this general tendency—with which, as a tendency, no one can find any fault—an interesting question here presents itself. Everybody knows that even in the reform of constitutional law there may be found limits, and the question is what those limits are.

We should gain very little either for the honesty or the strength of government by attempting to prescribe in the fundamental law all the minutiæ of its machinery, or to encumber it with vague maxims without making provision for their enforcement. The reason why American constitutions, notwithstanding their formidable numbers and continually increasing size, have never shared the fate of the paper-constitutions of Europe, is that they have always been severely practical instruments. None of their restrictive provisions have been "glittering generalities," for which any one could evolve a meaning from his own consciousness. They have been real commands, just as capable of enforcement as the commands issued by a military officer to his subalterns. If a man claims to be a senator or representative without right, the Senate or the House turn him out or admit him to a seat, and there is an end of the matter; if a State passes a law in violation of contracts, it is simply treated by the courts as non-existent, and there is an end of the matter; if a State were to attempt to make anything but gold and silver legal tender, the money would not be recognized by the courts, and there would be an end of the matter. The great respect for the courts always shown in America has not been the result of a sentimental admiration for justice, but the natural result of the immense power which we have given them. A great deal of the old dispute between the theoretical advocates of written and unwritten constitutions might have been avoided if a confusion between a written constitution like ours, and such constitutions as metaphysical European agitators have been accustomed to draw up, had not been made. Whether a constitution be written or unwritten is a mere accident, and any of our constitutions would retain all their peculiar characteristics if they were preserved by tradition, instead of on paper. The essential difference between our constitutions and all others is that the former consist mainly of a body of restrictive rules, limiting the ordinary powers of the Government in the interest of certain principles of justice and right supposed to be too well established to be ever again submitted to the chance test of popular favor, and that the whole force of the State is inevitably at hand to enforce them through the courts. This feature is wanting in the English constitution, commonly called an unwritten charter (simply because it has an unlimited power of expansion, although every existing part of it is even now to be found in print), and equally so in the written European documents. The true difference is not dependent on the form in which the instrument is preserved, but lies between a constitution made up of such phrases as "there is no duty without its right; no right without its duty," and one in which every right or duty is enforceable by the sheriff and the *posse comitatus*.

We may safely say that it will be a very dangerous moment for American liberty when reformers begin to forget this distinction, and dilute the strength of constitutional law either with wishy-washy declamation, or provisions which, being without means of enforcement, must remain a dead letter, deceiving people by the prominence given them as measures of reform and producing no practical results.

The question, then, always arises at each new attempt at constitutional amendment, whether we are adhering to this beaten track. Are the reforms suggested practical and capable of enforcement by the courts, or are they mere words? In answer to this, we may say, on the whole, that an examination of the Missouri constitution, the latest attempt in this direction, shows that no disposition exists among constitutional reformers to abandon the traditions of American law, but they seem determined to keep steadily in view the four cardinal points: the evil to be remedied, the remedy, the practicability of its enforcement, and the necessity of a sufficient interest in the matter to render its enactment worth while.

This last principle—which might be called that of interest "rightly applied"—is of quite as great importance as any other, and is at the same time, as we frequently see in the passage of laws, overlooked. To take the most notable instance: the great difficulty with the laws against the liquor-traffic is not that there is no crying evil to be remedied, nor that remedies of the most stringent nature have not been devised, but that they have proved impracticable owing to the want of a direct selfish interest in their enforcement. And the prohibitionists have begun in a blind way to see the difficulty, and attempt to meet it by giving the right of action to those supposed to have a direct selfish interest in the suppression of drunkenness—the wives and children of drunkards. If what the prohibitionists say, that the sale of liquor is a crime like murder or theft, were really true, there would be no lack of interest at all, and every man's hand would be against the liquor-seller as it is against the thief or murderer. But there is no such feeling. We see what lamentable results the overlooking this principle has in mere municipal laws; to ignore it in a constitution leads to still more deplorable results.

To take one or two instances: In dealing with the legislature a constitution might lay down a number of rules for the orderly conduct of its business, as that bills should be read three times on separate days, that they should not be crowded together at the end of the session, that bills must not be passed in the guise of joint resolutions. Now, here the evil is plain enough, but what is to be the remedy? The declamatory way of getting over the obstacle would be to pass a number of clauses to forbid these tricks, and then leave the people to find out what they were worth. The Missouri reformers, however, have not stopped here, but have asked themselves who has a direct interest in opposing such legislative tricks. The answer is of course that a small number of the legislature are sure to oppose almost every bill; and to this minority they have given the right of enforcing the remedy summarily in the courts. Again, there is the bribery of legislators. The ignorant and irrational way of preventing this is to multiply oaths, and this way has been tried in many States without success: the fatal difficulty with it is that, unlike oaths taken in a court of justice, there is in this case no individual or group of individuals whose interest it is to prevent perjury. The people at large have an interest, but unfortunately the knowledge of the facts which would prove the perjury

and corruption are not accessible to the people at large, but are in the possession of those most interested to conceal them. There is really no remedy for legislative bribery except the election of honest legislators. Therefore, we find a growing disposition against the multiplication of oaths. The usual remedies provided against special legislation, against the aggressions of corporations, and against local indebtedness, all follow the established precedents of American constitutional law. In a certain number of specified cases, the legislature is prohibited from passing private acts. It is hardly conceivable that there will ever be a time when a minority in the locality affected will not be interested to prevent the execution of a private act. A writ at law brings the act into court, and either validates or kills it. The taxpayers of a county which has overissued bonds have the same interest and the same remedy. With regard to corporations, the same thing is to be said: the passenger or the shipper is interested in bringing extortion to an end, as the shareholder in preventing overissues of stock or ruinous contracts.

Although there have been exceptions here and there, as a rule American constitutional law has followed this general line of development very closely, and it is gratifying to find in the last attempt at constitution-making in a new State like Missouri the old legal traditions asserting themselves so strongly. It is gratifying, too, to find, at a time when the political class seem completely lost in the clouds of abstraction and theory on every imaginable subject from civil rights to the currency, that few traces of their insanity show themselves in the constitutional groundwork of our system.

## TEMPORA MUTANTUR.

THE world turns mild; democracy, they say,
Rounds the sharp knobs of character away;
And no great harm, unless at grave expense
Of what needs edge of proof, the moral sense;
For man or race is on the downward path
Whose fibre grows too soft for honest wrath,
And there's a subtle influence that springs
From words to modify our sense of things.
A plain distinction is obscured of late:
Men, if they will, may pardon; but the State
Forgets its function if not fixed as Fate.
So thought our sires: a hundred years ago,
If men were knaves, why, people called them so,
And crime could see the prison-portal bend
Its brow severe at no long vista's end;
In those days for plain things plain words would serve;
Men had not learned to admire the graceful swerve
Wherewith the Esthetic Nature's genial mood
Makes public duty slope to private good;
No muddled conscience raised the saving doubt;
A soldier proved unworthy was drummed out,
An officer cashiered, a civil servant,
(No matter though his piety were fervent,)
Disgracefully dismissed, and through the land
Each bore for life a stigma from the brand,
Whose far-heard hiss made others more averse
To take the facile step from bad to worse.
The Ten Commandments had a meaning then
Felt in their bones by least considerate men,
Because behind them Public Conscience stood
And without wincing made their mandates good.
But now that "Statesmanship" is just a way
To dodge the primal curse and make it pay;
Since Office means a kind of patent drill
To force an entrance to the Nation's till,
And peculation something rather less
Risky than if you spelt it with an *s*;
Now that to steal by law is grown an art,
Whom rogues the sires, their milder sons call smart,
And "slightly irregular" dilutes the shame
Of what had once a somewhat blunter name;
With generous curve we draw the moral line;
*Our* swindlers are permitted to resign;
Their guilt is wrapped in deferential names,
And twenty sympathize for one that blames.
Add national disgrace to private crime,
Confront mankind with brazen front sublime,
Steal but enough, the world is unsevere,—
Tweed is a statesman, Fisk a financier;
Invent a mine and be—the Lord knows what,
Secure, at any rate, with what you've got.
The public servant who has stolen or lied,
If called on, may resign with honest pride:
As unjust favor put him in, why doubt
Disfavor as unjust has turned him out?
Even if indicted, what is that but fudge
To him who counted-in the elective judge?
Whitewashed, he quits the politician's strife
At ease in mind, with pockets filled for life:
His lady glares with gems whose vulgar blaze
The poor man through his heightened taxes pays,
Himself content if one huge Kohinoor
Bulge from a shirt-front ampler than before,—
But not too candid, lest it haply tend
To rouse suspicion of the People's Friend;
A public meeting, treated at his cost,
Resolves him back more virtue than he lost;
With character regilt, he counts his gains;
What's gone was air, the solid good remains;
For what *is* good except what friend and foe
Seem both unanimous in thinking so,
The stocks and bonds which in our age of loans
Replace the stupid pagan's stocks and stones?
With choker white, wherein no cynic eye
Dares see idealized a hempen tie,
At parish-meetings he conducts in prayer,
And pays for missions—to be sent elsewhere;
On 'Change respected, to his friends endeared,
Add but a Sunday-school-class, he's revered,
And his too early tomb will not be dumb
To point a moral for our youth to come.

J. R. L.

## THE BAVARIAN ELECTIONS.

BERLIN, July 30, 1875.

WITH but one exception, there has been nothing of particular interest going on in Germany, unless that for about five weeks we could have sung from morning to evening with the fool in King Lear:

> "With heigh, ho, the wind and the rain—
> For the rain it raineth every day."

One question, however—the elections in Bavaria—appears to me to call for a letter, for it throws a broad stream of light over the actual battle-field in our war between the state and Ultramontanism.

The first thing that strikes the eye in glancing over the election returns is the unusually small number of votes polled by the minor parties. The multiplicity of parties is a characteristic feature of the political life of Germany, and we are apt to pride ourselves on this peculiarity, as a proof that we have outgrown the crude notions of political childhood, which do not admit of anything between yes and no. Though I do not deny that there is some truth in this, yet there are undoubtedly two sides to the medal. As often as Bismarck is reported to think of retiring into private life, one of the principal reasons alleged for his discontent is the impossibility of counting upon a fixed majority in the Reichstag (or Landtag). Every party is but a minority, so that always a combination of at least two parties is needed in order to carry any measure. And it is sometimes not easy to foresee whether such a combination will be effected, for where public opinion is so much divided as to deem half-a-dozen or more questions worthy of serving as a foundation for the organization of a distinct political party, very marked shades of opinion are likely to exist with regard to every question of importance. Moreover, in such a condition of the public mind, the creeds of all the different parties are apt to be somewhat fluctuating; while, on the other hand, the multiplicity of parties favors the breeding of a narrow-minded pride of opinion. And all these evils are considerably aggravated when—

as is the case with us—the line of separation between the parties is drawn not so much by a difference of opinion in regard to definite and distinct questions, as by "principles"—*i.e.*, by a difference in the general way of looking at questions of public concern. In a state of such recent date as the German Empire, and with a people so prone to "individualism" in every respect, it is not surprising to find ourselves beset with all these dangers; but that does not render them any smaller. We should, therefore, heartily welcome everything fit to work as a counterweight to this "atomizing" tendency in our politics, and nothing has done us better service in this respect than the war with the Vatican. Already the composition of the last Reichstag showed considerable progress with regard to a consolidation of parties, and now the elections in Bavaria prove that a further step forward in this direction has been taken. In spite of the violent and envenomed declamations of a part of the leaders, the mass of the people, with the exception of only an insignificant fraction, have considered this to be the question which must be paramount to everything else, because our whole future depends upon the solution it receives.

The telegraph will have informed you long ago that the Ultramontanes will have a majority of two in the Second Chamber—79 to 77. Yet the result of the election is hailed as a great triumph by all the liberal parties, while the Ultramontanes make exceedingly wry faces over their "victory." In order to understand this, we have to go back a few years. The last elections took place in 1869. Then the so-called "patriots" carried the day, with a majority of 83 against 71, and yet they were not able in the decisive hour in 1870 to make the scales sink on their side. In certain respects they did not lose to the last their ascendency in the late Landtag, and yet they could not keep Bavaria from effectually co-operating in everything essential to the welfare of the Empire, though, undoubtedly, this co-operation would have been more vigorous and much more easily obtained if the liberal parties had commanded a respectable majority. What are they to expect from the future on setting out with a majority of but two, after the passions have been raised to the very highest pitch, and no stone has been left unturned by them? And what are they to expect in the rest of Germany if such is their fate in Bavaria, where out of a population of five millions three and a half millions are Catholics? The very utmost the Ultramontane majority of the Landtag can hope to effect is to keep Bavaria for a little while longer in such a condition that it resembles a carriage with the brakes screwed tight to the hind wheels; it can always be moved ahead, though one has to pull hard, and the grating of the wheels on the gravel is anything but pleasant. Even suppose life is rendered so disgusting to the present Cabinet that they conclude to retire, still the King—unless he completely changes the course thus far pursued by him—would never concede to the majority of two the right to demand an Ultramontane Cabinet. The probable result of such a Cabinet crisis would be the dissolution of the Landtag, and, so far as one can see now, there is certainly no chance whatever for the Ultramontanes to fare better in a new election.

This is the simple explanation of the strange fact that the vanquished are in high glee, while the victors are crestfallen and while away their time by throwing mud at each other. Two short quotations from the daily press will paint to you in vivid colors the state of mind in the opposite camps. The *Neue Würzburger Zeitung* (the electoral battle in Würzburg was particularly hot) writes: "They have degraded the divine service to a caucus, and put the pulpit beside the beer-bench. With crocodile tears they have moaned over the persecuted church, and stirred up the people to a crusade for their faith. They have prophesied the certain downfall of Christianity, and denounced liberalism as a child of Belial. As their last trump they have thrown the authority of their bishops into the scales, and they have tried to constrain the conscience of the people with their pastoral letters—but all in vain. The arrow which was to have hit the Empire in the heart,

> "Kraftlos entrann er ihren schwachen Händen;
> Sie haben keinen zweiten zu versenden"

(powerless it flew from their weak hands; they have no other to send). The *Fränkische Volksblatt*, on the other hand, cries out in an article with the heading, "A Huge Election Fraud": "This and no other name can we give to the unheard-of machinations with which the Liberals of Würzburg have swindled themselves into victory. These are hard words, grave accusations; but we repeat them before all Bavaria, before all Germany."

The language of the *Würzburger Zeitung* is strong, but hardly any too strong. The Ultramontanes have shown an unprecedented activity. The *Volksfreund* (Ultramontane) says that since the publication of the election districts of Munich (July 9) the "Bavarian party has held about 100 district meetings (secret ones included), distributed about 24,000 electioneering addresses, carried 11,600 election formularies into the houses of the citizens, and prepared 18,000 tickets." And they have been as active in the use of foul means. In the front rank of these stand, of course, the electioneering pastoral letters of the bishops. The quoting of a few sentences from one of these will, I trust, do much towards enlightening Americans about the true nature of the war, if there be yet any candid and liberal-minded Americans who have the least doubt about it. Bishop Reiszmann, of Würzburg—who, before his recent elevation to the bishopric, was reputed to be moderate—says in his pastoral letter:

"Who is this Ultramontane party which is said to be hostile to the Empire? We are meant, most dearly beloved ones; we who, faithful like our fathers, cling to the holy Catholic Church and its faith; we who in this Catholic faith seek our salvation here on earth and in eternity. Therefore, beloved ones, we also now call to the election day, as our adversaries do; for that this election day will be decisive as no other has ever been, friend and foe are agreed. . . . One mistake, one remissness on our part, will be decisive, and cannot be repaired by any future election. Therefore we must urge upon you: Let not a single vote be lost for our party; let no Catholic man who is entitled to vote stay away from the ballot-box on the 15th of July; let no work, not even the most pressing, no distance from the polls, not even the greatest, no inconvenience, and no consideration hinder the Catholic man, or keep him from casting his vote for the men of his confidence. Nothing of all this can excuse him before his conscience if, by his negligence or by his fear, he deprives the holy cause of his party of his vote. . . . This is to be read on July 11 at the divine service in all churches, without any additions or explanations."

In my opinion, there cannot be any doubt that this pastoral letter—and all the other bishops have issued similar ones—is unconstitutional, and, judging by a recent despatch from Munich, the Government seems to intend to call "the faithful shepherds" to account. If such should be the case, it will of course raise another outcry and be made use of as a further proof of the (never-contested) fact that the Cabinet are in an unholy league with the Liberals. And there is already a grave charge pending against the Ministers. The Ultramontanes insist that the result of the election would have been different if the election districts had been suffered to remain as they were before. That is true enough; but they quite forget to mention that the old election districts were arranged in such a manner that the greatest possible injustice was done to the Liberals. In the last elections for the Reichstag there were polled, in round numbers, 307,000 votes by the Liberals, and 480,000 by the Ultramontanes; yet the former could elect but sixteen representatives, while the latter had thirty-two. And as to the election for the Landtag, the relative strength of the Liberals is considerably greater than one would suppose from the above-mentioned vote, for in the election for the Reichstag every male citizen of age has the electoral franchise, while the electoral franchise for the Bavarian Landtag is made dependent upon a census qualification. That this restriction of the right of suffrage works to the advantage of the Liberals, certainly needs no proof. If any should be required, it may be found by a single glance at the election returns. All the great cities, with the single exception of Bamberg, have returned Liberal representatives, the capital leading in a most worthy manner. That this is a fact of the greatest moment with regard to the probabilities of the future, no one will deny. It certainly is not indifferent for the strength of a party whether it recruits itself mainly from the better-educated and well-to-do classes of cities like Munich and Würzburg, or from a country population which, you will remember, does not consist of New England farmers, but of European peasants, and moreover Bavarian peasants. Votes do not merely count; ultimately, it will always be proved that they also weigh.

So there is every reason to agree with Bishop Reiszmann: there is no possibility of retrieving at any future election what has been lost in this one. Now, neither he nor any other leader of the party would any longer acknowledge the fact. We can dispense with the confession if only our victory is proved by actual concessions. And not only have these begun in Bavaria, but along the whole line the order has been given to fall back one step. The Prussian bishops—the Prince-bishop (*Fürstbischof*) of Breslau leading the way—have made up their minds to submit to the law on the administration of church property. It will hardly be necessary to mention expressly that it is done under the pretence that there is an essential difference between the character of this law and that of all the other Falk laws. What this pretence is worth may be seen from the joint declaration of the bishops, of March 10, against this very law, in which the state is accused of laying hands on an "inalienable right" of the church. Sir John deemed reasons as cheap as blackberries, and our bishops have given more than one proof that they prize no higher even their most solemn declarations. They will as easily swallow the rest of them as soon as they are brought to see the necessity of it; and it is the first step that costs the most. The battle is won, though it is far from being ended. Every inch of ground will be contested with the utmost tenacity, but henceforth they fight with

the consciousness that theirs is a "lost cause." It is a sign of the times that quite a number of priests are reported to have voted the Liberal ticket in Bavaria.

## CAMILLE DESMOULINS.

PARIS, July 30.

THE history of the French Terrorists has a painful interest for everybody; for a patriotic Frenchman, the interest becomes almost intolerable. I always turn with disgust, fond as I am of books and old documents, from those which relate the incidents of the bloody period of the Revolution. I could not help, however, reading a book just written, with the aid of unpublished documents, on Camille Desmoulins and the group of men who were called the Dantonists. The author, M. Claretie, styles himself a republican of Athens; his white hands have never been and never will be dipped in blood. He is none the less an ardent follower of the Republican party, and he plays in it somewhat the part of the fife in military music. His sharp, shrill note is sometimes heard in the great tumult; he is not a great writer, and his style is full of an affectation which he probably considers romantic, but there is life in it, and there is a dramatic fire in his narratives. He probably began his book with the intention of making the apotheosis of Desmoulins and of the Dantonists. A handsome portrait of his hero is the frontispiece of the work; and looking at his large, brilliant eyes, his sensual nose and lips, his effeminate and at the same time impudent expression, you have already a glimpse of the man.

Camille Desmoulins was born at Guise, the capital of the once famous Duchy, the 2d March, 1760. And, by the bye, he told a lie when, in reply to the President of the Revolutionary Tribunal, he used the famous phrase: "I am thirty-three years old, the age of the *sans-culotte* Jesus." He was then thirty-four years old. The whole man is in this blasphemous reply. He was not, as he was sometimes called, a "*gamin* of genius," but he was a gamin—the gamin whom Barbier represents in his 'Iambes:

> "La race de Paris, c'est le pâle voyou
> Au corps chétif, au teint jaune comme un vieux sou,
> C'est cet enfant criard que l'on voit à toute heure
> Paresseux et flânant, et loin de sa demeure
> Battant les maigres chiens, ou le long des grands murs
> Charbonnant en sifflant mille croquis impurs."

His father was a legal officer in the *baillage* of Guise, and educated his son for the bar. He obtained a *bourse* (that is to say, he was educated at the expense of the state) in the Collége Louis le Grand, with Robespierre, who had a *bourse* in the college of Arras. He was a good scholar, and was admitted to the Paris bar in 1785, at the age of twenty-five. Desmoulins, who spoke with difficulty and who stammered, had become a writer; after the convocation of the States-General, he published an ode in which he celebrated the virtues of Louis XVI.:

> "Cher prince, des rois le modèle,
> Eh bien! nous doutions de ta foi,
> Et qu'au dessus de Marc-Aurèle
> La France dût placer son roi."

Two years afterwards he wrote a satire, in verse, against the king and the queen. He wrote many other verses, and in his 'Satires, or Collection of the best pieces of poetry which have preceded or followed the Revolution,' they may be found. Some of them, says M. Claretie, are "infamous." I use his own words, having never seen this collection. Camille led at that time the life of a politician in the streets and cafés of Paris. His poor father, who had not left Guise, and often dined with the Prince de Condé, must have been surprised when he wrote to him things like these: "A countess was flogged a few days ago in the Palais Royal, where she said something against M. Necker. The Palais Royal is the resort of those who have stentorian voices; they stand on tables, and read the strongest articles on the affairs of the time. . . . Three days ago a boy of four years, full of intelligence and well taught, went round the garden, in the middle of the day, at least twenty times on the shoulders of a porter; he screamed 'Law of the French people: la Polignac, exiled; Condé, idem; Conti, idem; d'Artois, idem; the Queen . . . I dare not repeat it." During the siege of Paris of 1870, a policeman was hunted by the populace and drowned, with his hands and feet tied, in the Canal Saint-Martin. There is nothing new under the sun. Here is a scene described by Desmoulins in a letter to his father: "The policeman was undressed; they found on him the cords which these rascals use. He was thrown into the basin of the Palais Royal; then he was hunted like a deer; people threw stones at him, struck him with their sticks; one of his eyes was put out. Though he begged for mercy, he was again thrown into the basin. His torture lasted from twelve till five, and there were as many as ten thousand executioners."

The reputation of Desmoulins began at the time of the taking of the Bastille; and his glory sprang out of the earth in a night, like a mushroom. He made the famous appeal to arms after the dismissal of Necker. See this young man on a table in the garden of the Palais Royal: "What colors shall we adopt," says he, "as a rallying-sign? Will you have the green, the color of Cincinnatus, of America, of democracy?" The crowd answers, "The green, the green." Camille at once breaks off a branch of a tree; in an instant all the trees of the garden are shorn of their branches. Then Camille screams, "To arms, to arms." Camille is now known; he publishes the 'France libre,' boldly attacks the monarchical form of government, and asks for a republic. "We were audacious," he wrote afterwards in his 'Page of the Secret History of the Revolution,' "we republicans in Paris the 12th July, 1789, and this is what covers with glory those who began the Republican campaign with such limited means. . . . These Republicans were mostly young men, who had been fed with Cicero in the colleges." He soon felt, however, that something more spicy than his 'France libre' was necessary, and he wrote 'The Speech of the Lantern to the Parisians.' This pamphlet secured for him afterwards the tragic name of "procureur-général of the lantern." Alas! he claimed it for a long time, till the guillotine, which had taken the place of the lantern, claimed him. It is in vain that he regrets afterwards, and tells Marat: "It is a great evil that the people should become familiar with such jokes"; in vain that he weeps over the pages which are exciting the populace to assassination.

He was poor in the midst of his triumph, asks his father for money, is consoled by hearing people say, "There is a new pamphlet of Desmoulins'." He publishes a weekly paper called *The Revolutions of France and Brabant*, which M. Claretie calls a masterpiece, etc. His success was of the same kind as the success of the *Lanterne* of Rochefort; and there are many traits of resemblance between the two men. Both want popular applause and money, both have a sort of boyish irony and impudence. If the Commune had triumphed, who knows if Rochefort, who was fleeing from Paris, might not have become a victim of his accomplices? There was too much of the scholar in him for the Communist; too much also in Camille Desmoulins for the last Terrorists. Desmoulins married in 1790 Lucile Duplessis; his witnesses were Pétion Brissot and Robespierre. The young woman was illegitimate, but she had a little fortune. Camille Desmoulins, to do him justice, seems to have been in love with her. He took his young wife to the club of the Cordeliers, an assembly of which he said, "Were the seven wise men of Greece members of it, its logic could not be more severe." Camille soon quarrelled with Brissot, who had been one of the witnesses of his marriage. A man who kept a gaming-table had been thrown in prison by the police. Camille undertook his defence; he set up for an Athenian republican; he wrote that "in the forests of Gaul and of Germany our forefathers staked their individual liberty at the *trente-et-quarante* and the *biribi*." Brissot attacked his defence of gambling. This miserable quarrel had its importance, as it determined the first attacks of Desmoulins on the Girondins, or *Brissotins*, as they were then called.

Camille had become a friend of Danton; he lived in the same house; he was one of those weak men who never know where to stop, and who are led away where they would never have dreamed of going. He became the apologist of all the great *days* (*journées*) of the Revolution; after the 10th August he was appointed secretary-general to the Minister of Justice, Danton. He writes to Guise: "The bladder of your people of Guise, so full of envy, will dilate against me when they hear of my new fortune." He called it fortune! Being a coward at heart, he often became afraid of his responsibilities, and sometimes talked about the pleasures of solitude and the fields of Guise. He was elected to the Convention as deputy of Paris. He was one of those men who could never be returned in their own provinces, but whom the great capital throws up on the highest political waves.

Camille Desmoulins never wrote a line in condemnation of the massacres of September. When the nominal vote was taken on the fate of Louis XVI., he voted for death, and dared to say: "A king less is not a man less." His virtuous father had written him a touching letter, begging him, as he had always denounced the king, to abstain. Camille had constantly and grossly insulted the queen since the beginning of the Revolution; he insulted her on the scaffold. He could no longer stop in his career; he made war now against the Girondins, and his 'History of the Brissotins' may be said to have been the signal of the movement which ended with the extermination of the Gironde. When the Girondins were condemned he could not help exclaiming: "My 'History of the Brissotins' kills them." Was it remorse, or was it fear? It was fear. The soul of this villain was not capable of remorse. All his sensitiveness was nothing better than nervous alarm about himself.

We must end this sad account of the history of a brilliant mind added to a mean character. Desmoulins became merciful only just at the time

when he was himself attacked by Hébert and the Jacobins, and began to suspect that he would soon need mercy. The end was soon to come. Arnault, the Academician, has left us in his 'Memories of a Sexagenarian' an account of the day when he saw the Dantonists taken to the scaffold. Danton looked proud and scornful; Camille seemed like a maniac—he tore his shirt; his breast, his shoulders were naked; he made pathetic appeals to the people: "People, you are deceived. The men who are to be immolated are your servants. I called you to arms in 1789. I uttered the first scream of liberty!" The weather was splendid, and the crowd was looking at the *charrette* with a worn-out curiosity, which even the names of Danton and of Desmoulins could not turn into real excitement. Who were the other victims? Hérault de Séchelles, once called *the beau* Séchelles; rich, received at court, a cousin of the Duchesse de Polignac, he had thrown himself into the revolutionary party out of mere vanity; he had burned before the people the throne on the Place de la Révolution. "Let the signs of servitude," he exclaimed on this occasion, "let the plough, the sheaf of wheat, the cap of liberty be the only decorations of the Republic!" The gentleman was not quite dead in him, for he approached the scaffold with the greatest calm. The other victims are not worth mentioning. Hérault ascended the guillotine first; the executioner would not allow him to embrace Danton. "Our two heads," said Danton, "will soon embrace each other." Then came Desmoulins' turn; his last word was for his wife. Then came Danton; and his last words have become historical: "Show my head to the people," said he to the executioner, "they will not often see the like of it."

Michelet says in his history of the Terror, "What was the poor Camille? An admirable plant which flowered on Danton." It is, perhaps, time that we should cease to classify the Terrorists as flowers in a garden. There is nothing poetical in these men; they have been magnified by the events with which they were mixed up. History must, of course, take into account the circumstances into which they were thrown; but it is time that we should judge them as men, and not as demigods. M. Claretie is still a devotee of the goddess Revolution, and of the men of 1793; he cannot help seeing the truth, but it got lost in his book in vapid declamations. If you collect all the real *evidence* about Desmoulins, he will appear to you as an unmitigated villain, with a great deal of what the French call *esprit*.

# Correspondence.

## MOTIVES AND ACTS.

To the Editor of The Nation:

Sir: In No. 520 of the *Nation*, you call attention to two conflicting decisions of Judge Dillon's, saying, "In 1869 the Iowa farmers were engaged in a very discreditable attempt to repudiate the town and county bonds," and that "Chief-Justice Dillon was ready to help them by laying down one theory of railroad property"; and "that in 1875 they are engaged in another attempt, equally dishonest, and Judge Dillon is ready to help them by laying down another theory of railroad property directly opposed to the former one." In No. 522 you say: "We had not intended, however, by anything we said to cast any imputation on Judge Dillon's motives," but "that foreign investors who do not know him, will see in his giving two decisions," each in favor of swindlers, "reason for doubting his purity."

Can foreign investors or any other honest-minded individuals, whether knowing Judge Dillon or not, come to any other conclusion than that, to render two decisions so diametrically opposed to each other, the Judge's motives must have been tampered with by some corrupting influences? You are rather severe on Mr. Beach and other exemplars of "chromo-civilization," but are you not yourselves, in this instance, while so roundly berating these wallowers in mud, also slightly in the mire? How can you or any one else reconcile these conflicting decisions with pure motives and honest juridical integrity? Can one's motives be read more distinctly than by his actions?

Respectfully, R. C. S.

Lazette, Kansas, July 26, 1875.

["R. C. S." is himself "slightly in the mire," owing to his failure to quote what we said more fully. Our language was: "The explanation the uncharitable foreign investor will be apt to put, we fear, on this extraordinary specimen of judicial wabbling . . . is that in 1869," etc. We did not put this construction on it ourselves—in the first place, because Judge Dillon's character has always stood very high; in the second, because he is now a Federal judge, and is, therefore, presumably independent of the Honest Farmer; and in the third, because a total change in the judicial mind on a point of law is not incompatible with judicial honesty. Our course, therefore, does not bring us into the category of the chromo-civilized. A chromo-civilized criticism of Judge Dillon's conduct would have been something of this kind: "Dillon is a corrupt old scoundrel. We have not the slightest doubt that both these decisions were bought and paid for in hard cash, and that if the truth were known he is looking for a nomination of some sort. But then in saying this we do not wish to be understood as casting any aspersion on his character. We accuse him of corruption in the regular course of our business as journalists, and because the sale of justice is denounced in the Bible. Personally, we consider Judge Dillon one of the finest jurists on this planet, a kind father, a dutiful son, a genial uncle, and, in fact, a cultured Christian gentleman."—Ed. Nation.]

## PROFITABLE AND UNPROFITABLE ECONOMY.

To the Editor of The Nation:

Sir: In your article of the 12th inst. on "Profitable and Unprofitable Economy," you have uncovered the root of our business troubles. "After a panic in money comes a panic of economy," and the patient who outlived the attack of the fever often dies of the regimen of recovery. Starvation is no more the remedy for the country's prostrate business than for a typhoid patient. One familiar with statistics might easily form an estimate of the effect on consumption of a general effort to reduce expenses. The extent to which a sanguine people living upon the scale established by a period of high prosperity is capable of reducing its expenditure under some strong impulse to save, would show an aggregate frightfully large, and quite enough to account for the universal absence of active demand for nearly all the productions of the country at the present time.

It is a fact that our markets are loaded down with surpluses in almost every department. Money—itself so erroneously supposed to be the one thing needful to stimulate business—is far in excess of the legitimate demand for it, and lying idle in vast amounts at the great centres. With all the means of life in apparent superabundance, the country is afraid to live. It is under the spell of the demon of economy, enforced or voluntary. Like Tantalus, it is up to the chin in a flood of good things, but cannot drink. For this state of things the press, as you point out, is largely responsible. "Universal extravagance" is assumed to have been the cause of the trouble, and universal economy is of course the obvious remedy. "Wear out your clothes," "discharge superfluous servants," "cut down wages," "dispense with luxuries"—in short, let every man go back several steps in civilization, and all will be well again. It is really not a very hard thing to follow this advice. A certain amount of self-denial in certain moods justifies the conscience of nations and individuals. We have been "going too fast"—that may be true. We ought to go slower; but the suspicion once aroused that we are "living in an era of speculation," that our "prosperity is unreal," that "credits are enormously expanded," a moral revulsion supervenes, and we fly at once to the other end of the balance and throw all our weight into the scale of "going too slow." When the tendency in that direction becomes strong and general there seems to be nothing to do but let it run its course, and die, as it will in the course of time, a natural death.

It may be well in the meantime to bear in mind that the great and sufficient cause of the existing dulness is the absence of demand, growing out of the unwillingness or inability of people to consume. All the phenomena of production and exchange centre upon the fact of consumption. With the failure of consumption comes the paralysis of industry as certainly as the cutting of a nerve of motion paralyzes a limb. It is absolute cause and effect. The cure will not be found in disputes about the use of the credit of the Government for currency (the greenback theory), as opposed to the use of the credit of the banks for currency (the specie-payment theory). With demand and supply in proper adjustment, we can get along with almost any kind of currency, or with no currency at all. Needed exchanges will effect themselves without the interposition of Government—though no argument is here intended against providing the business of exchange with the best currency that the wit of man can devise.

It is perfectly obvious that panics and revulsions occur in countries where specie payment is the rule and in countries where specie payment is not the rule; and though this does not settle the point that the specie-payment-credit theory is better or worse than the non-specie-payment credit

theory, it proves that neither the one nor the other is the true preventive of panics, nor the cure for their effects. The trouble here is really in the general credit system of the country, by which ninety-five per cent., or more, of the exchanges are effected, and not especially in the currency which, in comparison, is so insignificant an agency of business. The effects of the great panic of 1857 were not obliterated till men's minds became full of the war, and the energies of the population at home were taxed to supply the waste and consumption of the population at war. Demand for a season outran supply, and fortunes were rapidly made by the advance of prices. A complete demonstration was here afforded of the fact that in otherwise favorable conditions the business of a country will, as it were, transact itself quite satisfactorily without much reference to the currency which may happen to be employed. Neither the American nor the French Revolution failed because the one employed "continental" currency and the other *assignats*. The substantial fact remained in both cases that the necessary exchanges of commodities were effected, although with extremely imperfect instruments. And so in the Rebellion, each side used a currency not in principle materially different from "continental money" or *assignats*, and with a success which was measured rather by the outcome of the war than the intrinsic merits of the two currencies. By putting down the Rebellion "greenbacks" became a great success, while the Confederate money is not worth its weight in good rags. H. M. F.

August 15, 1875.

# Notes.

LOCKWOOD, BROOKS & CO., Boston, announce 'Toward the Strait Gate,' by E. F. Burr, D.D., author of 'Ecce Cœlum'; 'Correspondences of the Bible: Animals,' by the Rev. John Worcester; and 'Manual of Ancient History,' by Dr. John Lord.——Harper & Bros. have in press 'The American Revolution as seen by Horace Walpole,' edited by Mrs. C. H. Mohun.——Part 28 of Stieler's Hand-Atlas (L. W. Schmidt) has three beautiful maps of (1) North Africa and the Levant, with a side-map of the Nile Delta and the Isthmus of Suez on a scale five times as large; (2) N. W. France; and (3) Palestine and the Lebanon district. The Atlas will be completed in two more issues.——'Library Notes,' by A. T. Russell, is announced by Hurd & Houghton.——Dodd & Mead address a large audience in their forthcoming 'Common-sense in the Management of the Stomach.'——Macmillan & Co.'s fall announcements include 'Zoölogy and Geology of Persia, with Narratives of Travel,' by several writers, apparently colleagues of Sir F. J. Goldsmid on his telegraphic mission; 'Political and Military Episodes in the First of the Reign of George III.,' from the papers of Lieutenant-General Burgoyne; 'Ecclesiastical History of Ireland,' by W. D. Killen, D.D.; 'The Age of Pericles,' by W. Watkyss Lloyd; a 'History of Lloyd's and Marine Insurance,' by Frederick Martin (of the 'Statesman's Year-Book') and B. C. Stephenson; and 'Angola and the River Congo,' by Joachim Monteiro.

—The *Portfolio* for August (J. W. Bouton) is a good number, both in illustrations and letterpress, though the chief etching, by Brunet Debaines, after Turner's 'Port Ruysdael,' is not strong in expression of water. It seems to be too much for a French artist, nationally and inevitably weak as he must needs be in marine art, to comprehend Turner's forcible but experimental dealing with ocean effects; but the color of this hazy, ghost-like composition is well interpreted, and the sky, full of rising exhalation and saline fume, is admirable. The other etching, a Thames view, by L. B. Phillips, is respectable, and the photo-"fac-simile," a study of a travelling tinker, by Legros, is very good. Among the literary notices, Mr. Carr very gravely compares the late Frederick Walker with Millet, and there is the beginning of a spirited criticism by Mr. Atkinson on Wiertz, the desperate sensationalist of Belgium. The technical notes reach an extreme limit of attenuation in this number, being restricted to a slight explanation, seemingly by Mr. Hamerton, on a problem in etching. Surely the editor, with his special advantages of international acquaintance, could gratify the profession with accounts of the methods of eminent and recognized authorities, such as Baudry, for example, or Bonnat, or Couture, or even Merle, Boulanger, Duran, or Gérôme. The Munich school is probably beneath his notice, but there are pickings worth having in the art-discoveries of Piloty, Max, Beyschlag, and Genelli. The comparison of art-methods is so wide and fruitful a theme that it is most desirable to have it well reaped rather than gleaned.

—One of the latest admissions to the company of immortals in the 'Familiar Quotations' is Abraham Lincoln. Out of all his homely sayings and public utterances still current or well remembered, Mr. Bartlett has properly chosen the concluding sentence of the Gettysburg address. He gives it, as we believe, in its correct form, and perhaps in that in which it is most frequently quoted; yet we have found no less than three variants in as many reprints of the full address. In Edward Everett Hale's 'The President's Words' (Boston, 1865), p. 121, it reads as follows: "And that *the* government of the people, by the people, and for the people, shall not perish from the earth." In Samuel P. Bates's 'Battle of Gettysburg' (Philadelphia, just issued), p. 214, we find "*a* government of the people"; and in B. J. Lossing's 'Civil War in the United States' (Hartford, 1868), p. 80, "*governments* of the people." The exact phrase is that given by Mr. Bartlett, namely, "government of the people." A comparison of the three versions just cited shows that they were borrowed from a common source, which we surmise to have been the stenographer's report for the Associated Press at the time the speech was delivered (November, 1863). It differs in a number of important particulars from the original manuscript as we find it copied in Arnold's 'Lincoln and Slavery' (p. 423). The differences are mainly such as a reporter would naturally make in using the sign of the definite article for that of the demonstrative pronoun, *e.g.*, "we take increased devotion to *the* [that] cause"; "we here highly resolve that *the* [these] dead . . . that *the* [this] nation," etc. In one instance there has been a transposition of the auxiliary *shall* and the parenthetical clause "under God"—the latter standing first in the original; in another, the word *here* ("they here gave the last full measure of devotion") has been inserted, while a corresponding locative phrase has been omitted in the following passage (Mr. Lincoln's words in brackets): "the unfinished work that [which] they [who fought here] have thus far so nobly carried on." The most considerable rhetorical change is the following:

*Reporter.*—"We are met on a great battle-field of that war. We *are met* to dedicate a portion of *it* as *the* final resting-place *of* those who here gave their lives that that nation might live."

*Lincoln.*—"We are met on a great battle-field of that war. We *have come* to dedicate a portion of *that battle-field* as *a* final resting-place *for* those," etc.

Finally, the omission of the word printed below in italics takes away a shade of meaning which may or may not be missed, but which certainly harmonizes with that spirit of modest humility at the shrine of departed worth in which the speech was conceived: "The brave men, living and dead, who struggled here, have consecrated it far above our [*poor*] power to add or detract." It will be admitted that what promises to be the most classic and most enduring of American orations ought to be as carefully preserved, without alteration or abridgment, as a standard of weight or measure. And few, we think, will deny that on the whole Mr. Lincoln's composition was better than the reporter's. If his manuscript is still in existence, could it not be reproduced in fac-simile?

—The loss which any community suffers by the death of a sound lawyer is one usually more often felt by the profession itself than by the public at large, and this is undoubtedly true of the death of the late Judge Parker of Cambridge. Forty years ago, his death would have been that of one of the most rising lawyers of the New Hampshire bar, and a few years later it would have been that of Chief-Justice of New Hampshire. For ten years he held this position, and abandoned it to take a chair in the Law School at Cambridge, which he occupied for twenty years. He was emphatically a learned lawyer of the old New England school, as well trained in the technicalities of pleading as in the principles of the law, and taking a great delight in the law as a complete system, not perhaps mathematically perfect, but sufficiently so to gratify the natural love of order, and at the same time give scope for the exercise of much ingenuity in drawing inferences and taking distinctions. As a teacher, the full effect of his learning was impaired by a dry manner, and many students have probably found his conversations about law more interesting than his public lectures. The Law School at Cambridge is much changed and much improved since his time. Degrees are now dependent on examinations, new methods of study have taken the place of the old, and a general spirit of progress has taken possession of the place; but it may be doubted whether the school will ever possess a teacher more completely at home in the subject which he taught, or more thoroughly and conscientiously a lawyer, than Judge Parker.

—French Protestantism, and all that depends on the growth of Protestantism in France, has met with a great loss in the death of Athanase Coquerel the younger. He was born in Amsterdam in 1820, while his parents were on a journey, and was destined himself to be an extensive traveller—in Europe, in Asia Minor, in the United States—thus adding to the breadth of view which he derived from his distinguished father and from his religion that which comes from experience of foreign parts, and is too

seldom acquired or sought by Frenchmen. For all that, he remained a Frenchman to the core, and never could forego his resentment towards Germany, and never, so far as we remember his utterances in the *Renaissance*, was able to lay the fault of the Franco-Prussian war squarely upon the shoulders of his countrymen. He was slightly wounded in the leg while ministering to the wounded during the siege of Paris; but he could forget and forgive this more easily than he could the loss of Alsace and Lorraine, and the annexation with them to Germany of a large and substantial fraction of his co-religionaries. But really he owed less animosity to Bismarck than to Guizot, the leader of the Orthodox party, sometimes designated in his lifetime as a Papist Protestant, or a Protestant who didn't protest. He was at least a Protestant Pope, and when Coquerel had reviewed in a friendly spirit Renan's 'Life of Jesus,' he suddenly found himself excommunicated. At Guizot's instigation his license to preach was revoked by the Consistory of Paris, whereupon he founded near the Bastille a so-called Liberal Church, which was attended by a large congregation of his admirers. As a preacher, his reputation outweighed, and no doubt deservedly, his father's. His last years were troubled by the plight into which Guizot's influence with Thiers and his government had plunged the Liberal wing of the French Protestants, and he foresaw many trials and persecutions for those who, like himself, joined a Unitarian faith to a persistent assertion of direct inheritance from the Huguenots. His visit to America, where he arrived four years ago this month, ought to have been a recreation from the severe mental strain of the siege of Paris and the Commune, but it was in reality a money-raising mission, in behalf of the threatened Liberal cause, and proved a severe strain on his vital powers. He died suddenly of a bronchial affection, July 25, at Fismes, in a purely Catholic region, and there, rather than at Paris, he insisted on being buried, in order to test once more the right of the state religion to forbid the sepulture of heretics in consecrated ground. His burial, however, was not obstructed by the authorities.

—Alluding in our issue of May 13 (No. 515) to the inception of the *Antikritiker*, we repeated the current rumor that "the intellectual godfather of the undertaking" was a certain "Prussian local medical inspector and writer," whom we did not name. We added that we believed he had a rather bad reputation on account of his literary quarrels, and we suspected that he played "a more prominent part than the prospectus and title-page intimate." We have received from Herr Nehring, the publisher of the *Antikritiker*, a delayed letter covering one from Kreis-Physicus Dr. Schauenburg, who expresses great indignation at our treatment of him, but who leaves it for Herr Nehring to say that he (Dr. S.) is an esteemed medical author, and that he has no more to do with the conduct of the *Antikritiker* than any other contributor. We are sorry to have been misinformed in this matter; our allusion to Dr. Schauenburg's reputation was, we need hardly explain, not intended as a reflection on his moral character.

—Sybel's *Historische Zeitschrift* contains a review of Mr. Bancroft's 'History of the United States,' and more particularly of the last volume, by Dr. Von Holst. After praising the work as the beginning of scientific historical research and writing in this country, and as laying the foundation for all future writers on the same theme, the critic proceeds to point out some of the particulars in which Mr. Bancroft ought not to be received as an authority. He finds in Vol. X. an unreasonable space allotted to Germany—its history since the Christian era, and the attitude of its leading minds, and especially of Frederic the Great, towards the American Revolution. Mr. Bancroft, he says, conveys a wholly false impression of the state of feeling in Germany at that time, and almost tones out of sight the ugly facts concerning the letting of mercenaries to England, which Dr. Kapp so clearly brought out in his 'Soldatenhandel.' The last-named author had also, as long ago as 1871, told the truth about Frederic the Great in a work specially devoted to his relations with the United States; but Mr. Bancroft, says Dr. Holst, neither reports the facts nor so much as mentions Kapp's work. But strangely enough, while thus painting in warm colors the sympathy of the German men of letters and the Prussian king for the struggling colonies, Mr. Bancroft belittles the part played by those German commanders who proved their sympathy by joining our armies and taking the field against England. His slighting estimate of Steuben is in curious contrast with that arrived at by Dr. Kapp in his biography, which was declared to be without exaggeration by Mr. Bancroft himself when furnishing an introduction to the 'Life of Steuben.' Kalb is depreciated in like manner and equally in the face of notorious facts. The same faulty perspective which gives undue prominence and credit to Germany, causes the intervention of France to be undervalued. Dr. Holst cites a good deal of evidence to show that Mr. Bancroft has given an untrustworthy account of the good behavior of American troops as contrasted with that permitted by British officers; and of the patriotism and enthusiasm of the American people during the Revolution. "Enthusiasm," it is remarked, "is so far from having been a characteristic feature of the War for Independence, that one might almost be tempted to call the want of it characteristic." And again: Mr. Bancroft portrays "an extraordinary people under quite commonplace leaders, while it was in truth a quite ordinary people under leaders some of whom at least were extraordinary in the highest degree." In the chapter with a misleading title—"Striving for Union"—occurs the statement that "the American *people* were bent on having a government," whereas, says Dr. Holst, citing various American authorities, a central government was attained only after the greatest friction on the part of the States, and mutual concession and sacrifice under "a grinding necessity." He sums up Mr. Bancroft's defect as an historian in a word not easy to render in English—*Tendenz;* bias, purpose, or preconceived theory, we suppose we must call it.

—Those who have read Mr. Darwin's works are aware that there is no bird of greater metaphysical interest to man than the pigeon. It was from the results of pigeon-breeding in fact that Mr. Darwin was led to some of his most startling conclusions with regard to the descent of man from another representative of the animal kingdom. It must have struck a good many people that the pigeon may be of interest not merely as throwing light on our own somewhat dark past, but as being itself no less than man a progressive animal, and so worthy of some speculation as to its own future development. A correspondent of the *Spectator*, having this praiseworthy object in view, has been apparently for some years studying the rise and progress of the carrier-pigeon, and in a recent letter to that paper he gives some conclusions and predictions which are rather startling. With the carrier-pigeon the effect of careful breeding is of course to perfect its flying capacity, and if this correspondent, who is evidently quite *au courant* in the matter, is to be relied upon, we are on the eve of very important events in pigeon-flying. Fifty years ago, he says, when a pigeon accomplished the journey from Paris or London to any part of Belgium, he had a regular ovation (such a feat was this considered to be), and he became "an object of all but national worship." Nowadays, any number of pigeons are regularly let loose on the Spanish frontier, at the southwest angle of France, to fly to Liége in the east of Belgium, close to the German frontier, they being expected to accomplish this distance (580 miles as the crow, but not the pigeon, flies) within twelve hours. A bird that gets in in eleven hours may indeed bear off the national honors for the year; not by being the only bird, but by being the first of a number. This extraordinary development in the last fifty years has been due to the application of the principle of selection on a national scale to millions of birds. In the light of the progress already made, the question arises whether a pigeon might not cross the Atlantic. The correspondent doubts this, but is ready to maintain the "almost indefinite perfectibility" of the pigeon, provided always that he has natural landmarks to go by. Thus he says he should not consider it the least impossible that, "if general attention were turned to the training of pigeons," and "if the world at large were to throw its resources into the matter," a hundred years would develop a bird that might come back from Japan as easily as a bird now goes from Spain to Belgium. As to the rapidity of the pigeon's flight, he says: "Under favorable circumstances, a pigeon may perhaps fly a hundred miles an hour. It is conceivable that, applying those principles of transmutation which have differentiated the race-horse from the cart-horse, our '1950' pigeon might reach to one hundred and fifty or say even two hundred miles an hour." So that if their power of carrying weight could only be developed as rapidly as their flying powers, our "1950" pigeon would be the best mail-carrier in the world, and indeed we see no reason why we should not obtain, a century or two later, a bird combining the rapidity of the pigeon with the other valuable qualities of Sinbad's Roc.

## THE BOOK OF MARCO POLO.*

I.

WHEN Marsden published his learned edition of the 'Travels of Marco Polo' in 1818, it was supposed that he had so nearly exhausted all the possible sources of illustration of his author that future editors would find little or no matter for new commentaries. And when in 1865 Pauthier gave to the world a substantially authentic text for the old traveller's narrative, under the title of 'Le Livre de Marco Polo,' and astonished European

* 'The Book of Ser Marco Polo, the Venetian, concerning the Kingdoms and Marvels of the East. Newly Translated and Edited, with Notes, Maps, and other Illustrations, by Colonel Henry Yule, C.B., late of the Royal Engineers (Bengal). Second edition, revised, with the addition of new matter and many new illustrations.' 2 vols. 8vo. London: John Murray. 1875.

scholars by an imposing display of Chinese and other recondite lore, accomplished critics expressed a similar opinion with respect to his labors. But in the first edition of an English translation which appeared in 1871, the learning and diligence of the distinguished Oriental geographer, Colonel Henry Yule, brought to the elucidation of Polo's meagre, fragmentary, and confused recital a great amount of interesting and valuable material, which, though not inaccessible to earlier editors, had remained undetected until his patient and comprehensive researches brought it to light. The four years which have elapsed since the original publication have enabled our editor to incorporate in a second issue a large stock of new explanatory and supplementary matter, both from existing sources, which even he had overlooked, and from the journals and private communications of very recent travellers in the wild theatre of Polo's wanderings.

But Colonel Yule's rectifications and augmentations of our knowledge of the *terra incognita*, no insignificant portion of which had remained untrodden by any European foot save the Polos' until the present day (we may almost say, hour), are by no means wholly borrowed from the reports of others. His long personal familiarity with the East had qualified him to comprehend and interpret much that had proved unintelligible to former students, and he has given proof of rare discrimination in reconciling and harmonizing many apparently conflicting statements in his text by judicious choice between different readings, by happy conjectural emendation of corrupt passages in the manuscripts, and by illustrations and supplementary contributions from his own ample stores of knowledge, as well as often from quite unexpected quarters. Colonel Yule modestly disclaims any extraordinary amount of linguistic attainment, but few professional scholars, even in these days of polyglot study, read as many tongues as he, and in his felicitous translations from quaint and obscure or equivocal originals (which may well earn for him the compliment of *grand translateur*, anciently bestowed upon Chaucer), in his verbal criticisms, and especially in his new and ingenious etymologies, he has exhibited a linguistic sagacity which would have placed him in the first rank of philologists if he had chosen to devote himself to language with as much zeal as he has done to geography. We will not anticipate the judgment of the learned by suggesting that Colonel Yule has given further evidence of his knowledge and command of the dialect of his author, in the concoction of the curious "manuscript in the old French tongue of the early fourteenth century," quoted in the preface to his second edition; but in any case, the reader who, supposing himself a proficient in that "old French tongue," denies the genuineness of the manuscript, will show no mean amount of attainment in that respect if he is able to adduce good *linguistic* grounds for questioning its authenticity.

While linguists are many, truly genial geographers have always been few, and the most adventurous and even learned travellers—such, for example, as Manning, whom Charles Lamb vainly endeavored to dissuade from a journey to "Independent Tartary"—often want the power or the inclination to turn their observations to any real scientific account. It is therefore fortunate for the cause of knowledge that Colonel Yule has chosen to exert his rare gifts in a comparatively unattractive and unambitious field of labor, and contented himself with arranging around Polo's slender and disjointed carpentry a mass of binding, covering, and decorative joiner-work, which has compacted it into a coherent and harmonious whole, instead of rearing an independent monument to his own literary reputation out of original materials. The compositors' rule, oftener preached than practised, is: "Follow *copy*, even if it go out at the window." The commentator must stick to his author with like fidelity, though he lead him to the antipodes. Hence, in a case like the present, the arrangement of his illustrative and supplementary matter can be neither alphabetical nor chronological, nor even strictly topographical, and, to borrow an illustration from an art in which Colonel Yule is an adept, his architecture, though not wanting in unity of design or in symmetry of detail, must be of the Arabo-Gothic rather than of the Grecian type. At the first view, therefore, the book in its present form has not the aspect of a philosophical whole, and in fact we are not yet able to co-ordinate scientifically the scanty geographical secrets of the impenetrable East, which thus far have been more or less dimly revealed to us. But what is possible in this respect has been most ably done by our editor, and it is by no means unmerited praise to say of this new redaction of the book of Messer Marco Polo, that it has certainly done much more to illustrate the wanderings of the Cathaian traveller than any—we are tempted to say than all—of the threescore editions which had preceded it. Indeed, as a repository of our existing knowledge of 'Cathay and the Way Thither,' it comes very near realizing the ideal prefigured by a former publication of Colonel Yule's under that quaint but attractive title.

He has, however, by no means confined himself to the illustration of Polo's itinerary, which could have no great interest except for geographical specialists. His enquiries embrace a vast range and variety of subject, natural, civil, and religious history, political economy, social institutions, manners and customs, commerce, curious questions in literature and art, directly or indirectly connected with the nature and life of the vast countries lying between Venice and the uttermost East, or bordering on the routes followed by the three Polos in their whole periegesis and their intermediate journeys. This wide scope of research has given opportunity for many learned disquisitions and erudite excursuses, which Colonel Yule's spirited treatment and pleasant style have rendered attractive, and he has thus accomplished the difficult task of making even a commentary in a high degree both instructive and entertaining.

The introductory matter, text, and annotations fill two octavos of about 600 pages each, of which the narrative, though printed in large type, composes not much more than a quarter. Fifty closely-printed pages are occupied with a singularly complete and commodious verbal and real index, wisely arranged under a single alphabet; the form, type, paper, and mechanical execution of the book are unexceptionable, and the pictorial illustrations numerous and well designed and engraved. In short, the author and publisher have evidently spared neither pains nor cost to make these volumes as conspicuous for their material good taste, elegance, and convenience as for their literary merit.

'The Book of Marco Polo' has given rise to more questions difficult of solution than any work of the same nature which has ever appeared. For example, the personal veracity and general accuracy of the traveller, the possibility of tracing his routes and identifying his localities, the reason for certain strange omissions to notice remarkable objects, facts, and customs with which Polo, supposing his narrative to be true, must have been familiar, such as the great Chinese wall, the mariner's compass, gunpowder, the art of printing, the general use of tea, and the like, which we should suppose could not fail to strike very powerfully the attention of an intelligent European of the thirteenth century; then the critical doubts as to the form and language of the original text, and whether there may not have been a later and more complete recension than any of which manuscripts have yet been found—all these Colonel Yule has ably discussed, and to many of them given satisfactory answers, though there remain some of which no sufficient resolution has been suggested. One of the most important of these, next to the fundamental problem of Marco's sincerity and honest purpose of speaking the truth, comes under the last head—that, namely, of the possible existence of a fuller recital of the traveller's observations than that of which alone old copies are known to us. Ramusio's Italian text, published about the middle of the sixteenth century, contains a considerable number of weighty passages which do not occur elsewhere. Are these fabrications, or are they taken from a more complete narrative drawn up by Polo at a later period, and under more favorable circumstances than that taken down in French, from his oral recital, by Rusticiano or Rustichello di Pisa, his fellow-captive in prison at Genoa? Many critics have rejected these additions as spurious, less on the ground of improbability or internal evidence of unauthenticity, than because Polo himself is known to have recognized the text of Rusticiano (in which they are not found) as authoritative, as no manuscript copies are known from which Ramusio could have borrowed them. Colonel Yule, for reasons which it seems difficult to resist, believes that they are in great part "supplementary recollections" of the traveller noted down at a later period of his life by way of illustration or complement to some copy of Rusticiano's manuscript; and we may add what, perhaps, should have been said before, that our editor is firmly persuaded of Polo's strict veracity and honesty of purpose.

The neglect of Polo to mention noteworthy points which could not possibly have escaped the observation of one who travelled so emphatically with his eyes open as the Venetian, is not so easily dealt with, and, after all, we cannot do better than to ascribe the omissions, in a general way, to the peculiar circumstances under which Polo's narrative was communicated to his companion in captivity. It was written in a crowded prison, where, as Cervantes says, "todo triste ruido tiene su habitacion" (every doleful sound hath its abiding-place), and of course in the midst of innumerable interruptions and distractions. Many years had elapsed since the period of the earliest journeys, and Marco had neither journal nor notes to refresh his memory, or indeed, so far as we can see, any motive for deliberately recording observations which might, under the circumstances, prove revelations of important commercial secrets to the rivals and enemies of his country. These considerations account for many imperfections. But we, being unhappily of the guild of bookmakers, think ourselves authorized to treat this as a question of our competence, and to theorize a little on the

composition of Rusticiano's book. We shall therefore, *pace* Colonel Yule, enter into some perhaps heretical, and possibly even not altogether novel, speculations on the technical authorship of the work.

According to Rusticiano, the two, being together in prison, said to each other: "Go to, now, let us make a book," and thereupon Polo dictated, and Rusticiano as amanuensis wrote, this now world-famous story. This account of the origin of the work has generally been accepted as satisfactory, but let us consider the probabilities. There is no apparent reason why Marco, who, educated as a merchant, certainly was able to write, should have dictated his narrative to a scribe instead of penning it himself; the first person is rarely used in the recital, which has much more the air of a hearsay report than of a copy from formal dictation; it is too unmethodical and *décousu* to be accepted as a deliberate history of travel and observation. It is written in French, not the vernacular of either party, Marco being a Venetian, Rusticiano a Pisan; and, considering where and how Polo spent the years of his youth and early manhood, it is hardly probable that he even knew French. It is therefore a translation, not an original redaction, and as it is much more strongly marked by Italic words and idioms than Rusticiano's other works in French, the communications from which it was derived were probably made in Venetian, Marco's household speech, or in that of Rusticiano, Tuscan, which at that time, A.D. 1298, had already acquired recognition as the *lingua comune* of Italy. Now Rusticiano was a professional writer, or, to describe him more accurately, a writer by trade. He would have been the Anthony Munday of his time, a regular bookseller's hack, had he not lived before the halcyon days when, to the infinite advantage of literature and the unfailing solace and comfort of "unprotected" authors, the process of evolution, development, or natural selection had unfolded that latest form of literary organism—the modern bookseller. Rusticiano combined in himself the functions of author, editor, and publisher, "three single gentlemen rolled into one," and he found it convenient to live on the product of other men's brains rather than on the growths of his own. So he translated, revised, compiled, abridged, and supplemented for publication or republication such good matter as he "became possessed of by finding." The marvellous relations of Messer Marco might very naturally strike him as excellent raw material for a new book, especially as the prison library was probably not very rich in *materia prima* for literary elaboration. Hence, under correction, it seems to us very probable that Rusticiano, upon his own mere motion, and not as the scribe of Polo, jotted down what struck him most in the conversations with which they whiled away the dreary hours of their long confinement. He wrote the story in French, because French was his professional language, and was indeed employed as best suited for general circulation by many a better man than himself—as, for example, Brunetto Latini and Canale, the one a Tuscan, the other a Venetian. We may suppose, then, that in Rusticiano's text we have not what Marco would deliberately have dictated as a history of his adventures, but so much of his oral narratives, delivered rather in the form of *yarns* than in a consecutive recital, as the "gaping soul" of Rusticiano understood or misunderstood, remembered, and thought good to record; and we may fairly ascribe many of Polo's otherwise unaccountable reticences and discrepancies to a want of intelligence, judgment, and memory in his reporter. Nor is the fact that Polo subsequently recognized Rusticiano's patchwork as authentic, by giving away copies of it, in the least inconsistent with this theory. Polo, once at liberty, and returned to his merchandising and other cares at Venice, would naturally have other things to do, in restoring his affairs, deranged by his absence, and setting his house in order, than to write a book, and he would gladly avail himself of Rusticiano's labors to spare himself a toil, for which, as a busy man and "no scholard," he had neither leisure nor stomach. He virtually said to the curious world: "Take this; ye get no more of me"; and we must thankfully accept this summary, such as it is, not only as the one source to which we owe nearly all we know of Polo and his wanderings, but as a memorial, without which, as our editor suggests, even the name of the Venetian Ulysses might have utterly perished.

Polo's reputation for veracity was by no means high in his own time. Not only was he known as "Squire Million" to the street (or rather canal) boys of Venice, but he is complimented with that sobriquet in legal documents of the period. Copies of his recital, indeed, were multiplied; but, probably on account of the general distrust of his reports, he seems to have produced little general impression on the European mind of his own or even of succeeding centuries. Mandeville, whose descriptions sometimes so nearly coincide with Polo's as to have suggested the idea that his book is made up of plagiarisms from Marco and other voyagers, never mentions Polo. Even Dante does not appear to have had any knowledge of him; he is not referred to in the Dittamondo of Fazio degli Uberti, or, so far as we have observed, by the compilers of any of the encyclopædic works of the fourteenth century, or by Froissart, fond as he was of fable and tales of adventure; and Col. Yule does not find Marco to have been freely used by any writer of that period except the author of the romance of 'Baudouin de Sébourg.' On the other hand, Chaucer, who, we believe, does not name Polo, was evidently acquainted with his travels, and, as Col. Yule pointed out, borrowed the name of his hero Cambuscan from that of Chinghiz Kaan, who figures so largely in Polo's history. But Chaucer was a fabulist, and would not have respected or quoted Polo the less if he had supposed all his reports to be quite fictitious. De Barros, so far as we have been able to discover, refers to Polo only once, and then barely to correct an error respecting Prester John into which the traveller had fallen, nor can we find any mention of him in Clavijo, in Pietro della Valle, or in Coryat. It is curious that while Milton's imagination was evidently fired by Messer Marco Millione's notices of the "barbaric pearl and gold" which "the gorgeous East with richest hand showers on her kings," and his poems are pervaded with the *prestige* of Oriental life, Shakspere nowhere gives any indication of a knowledge of Polo's travels, scarcely even of an acquaintance with the strange world that forms their theme. But Shakspere, long before Pope, was of opinion that the "proper study of mankind is man," and Polo's Paynims were as simply men and only men as the most home-bred of the dramatist's countrymen. With him the accidents, the outward circumstance, the integuments of humanity were nothing, and under his scalpel the moral and intellectual dissection of the Englishman showed an organization not differing from that of the Tartar. Shakspere, therefore, had nothing to learn from Polo, and the material splendor of the East had no attraction for his eyes. Besides, Shakspere was a contemporary of Raleigh, whose search for El Dorado, following the Spanish conquests in America, had turned the minds of Englishmen in another direction. The old half-superstitious reverence for the East was neutralized, and men were coming to believe that not the morning star, but Hesperus, indeed, "bringeth all good things."

GEORGE P. MARSH.

ROME, June 26, 1875.

---

*A Christian Painter of the Nineteenth Century:* Being the Life of Hyppolite Flandrin. By the author of 'A Dominican Artist,' etc. (New York: Pott, Young & Co. 1875.)—The story of Hyppolite Flandrin's laborious, remarkable, and prematurely-arrested career has been related here in a tone a trifle "goody," perhaps—a trifle too suggestive of what is called "Sunday reading"—but with great good taste and sympathy, and much of what the writer himself (who is either an English Catholic or a sublimated Ritualist) would call unction. Flandrin's life and labors, however, are a very fair subject for unction, and the author exaggerates nothing in calling him above all things a "Christian painter." The great mass of American travellers know him chiefly through the noble mural paintings of the beautiful church of St. Germain-des-Prés—that smaller sister of Notre Dame. These may be called a great achievement, in spite of all deficiencies, and when it is observed that they represent but a small portion of the artist's work, and that he died, wearied and with sight impaired, at the age of fifty-five, it will be seen that he deserves a substantial memorial. Except a certain number of fine portraits, he painted nothing of consequence all his life but religious subjects. He may almost be called a theological painter. His long processions of saints along the entablature of nave and aisles, seen through the dim, colored light of St. Germain-des-Prés and Saint Vincent de Paul, have, if not the archaic rigidity, much at least of the simplicity and dignity, and of the look of being fashioned in serene good faith, which belong to the great mosaic figures wrought by the early Christian artists in the churches of Ravenna. If one had inclined to doubt that Flandrin worked in perfect moral harmony with his pious themes, his biography would offer a complete refutation. Modern religious painting is, we confess, rarely to our taste; but Hyppolite Flandrin's is among the best. Flandrin is less skilful in certain ways than Mr. Holman Hunt, but we prefer him either to that artist or to the mystical Overbeck. He is not at all mystical—he is not even very largely symbolic; but he commends himself by an extreme sincerity and naturalness, and by a mild solemnity which has not the drawback of seeming to have been produced by ingenious research. This is made plain to the reader of Flandrin's letters, from which the author has quoted with a frequency for which we are grateful. We only regret that she might not have left them, or parts of them, in the peculiar homeliness of Flandrin's French. They are not brilliant; they are hardly even interesting. Flandrin was a mild and passive soul, and his phrase lacks trenchancy, just as his character lacked it. But this character,

as his letters reflect it, was so earnest and grave, so single in aim, so all of one piece, that it seems to remind us again that the main condition of success for an artist is not so much to have an extraordinary gift as to use without reservation that which he has. Flandrin was no dilettante—he was not at all a product of what is called the highest culture of the time. He was a plain man, born into poverty and trouble, who learned his art by sacrifice, and believed in the priest, the rosary, and the *bénitier*. Thirty years in Paris studios never perplexed his faith, and he had the happy faculty of assimilating the current cleverness only just so far as it helped him.

He was born at Lyons in 1809, and his early years were spent in that hard apprenticeship to misery which has been the lot of so surprisingly large a number of eminent Frenchmen. His father was a struggling miniature-painter, with seven children, and two of his brothers manifested an inclination for the brush. One of them, Auguste, died young, after achieving respectable promise; the other, Paul, is a distinguished painter of the old classical landscape of composition. Paul and Hyppolite came up to Paris when the latter was twenty, and entered the studio of Ingres, then the leader of the liberal movement. Ingres was in the full sense of the word Flandrin's master, and Flandrin was completely submissive to his influence. What Flandrin eventually became was a less frigid and less classical but also a less accomplished and less various Ingres. As with Ingres, his strong point was outline and his weak point color. He competed in 1832 for one of the *prix de Rome*, and gained it, went almost immediately to the Villa Medici, and remained there for more than five years. In Paris he had felt, in all its cruelty, the pinch of poverty, and even in Rome, having nothing beyond his very moderate pension, he was uncomfortably impecunious. But after his return to France in 1838, fame and prosperity came to him with little delay, and from that moment his life was filled to overflowing with well-remunerated work. He received many Government commissions, and worked on a vast scale in the churches we have mentioned, in those of St. Séverin, in Paris, of St. Paul, at Nîmes, and of Ainay, near Lyons. In 1841 he lost the sight of one eye, in consequence of an unsuccessful operation undertaken to correct a squint. His frescoes look indeed like the work of a man who is without the faculty of seeing things in relief; his figures have too many flat surfaces. His health had never been strong, and in 1863 he went to Italy for rest. He found it—but for ever, dying in Rome a few months after his arrival. His letters contain few passages salient enough to quote, but we recommend them to the reader. They have an almost childlike simplicity, and give one a great good-will to the writer. He was not a painter of the first force; one can hardly call him interesting, in any deep meaning of the word. But he had in a remarkable degree a natural sense of certain beautiful qualities—sweetness, dignity, elevation, and repose—and here and there he reached something akin to grandeur. The great point with him is that, so far as he goes, he is perfectly genuine. He believed in the miracles of the saints whom he painted, and yet his painting was almost as "knowing" as if he did not.

---

*The Sonnet.* By Charles Tomlinson, F.R.S. (London: John Murray. 1874.)—After the *ottava rima* there is in Italian no metrical combination so peculiarly national and popular as the sonnet. Its origin and early history are not clear, and it was to be expected that the author of the present work would throw some new light on these points, or at least reproduce the opinions of his most trusty predecessors in this field. The early history of the sonnet requires, at least for negative purposes, a knowledge of Provençal, with which language Mr. Tomlinson does not seem at all acquainted. This would not make any great difference were he familiar with the works of such scholars as Diez and Bartsch, whose statements in regard to Provençal poetry he could have received with perfect confidence. His ignorance of the bibliography of his subject leads him into some amusing blunders. For instance, on page 12, he has occasion to mention the *sestina*, and remarks that he was unable to find in Crescimbeni, or any similar authority, on what principle the terminal words of the various stanzas were arranged. He called to his assistance a mathematical friend, and between them they solved the puzzle, which solution, we may remark, is to be found in any good work on Italian prosody, or in Affò's 'Dizionario della Poesia Volgare.'

Mr. Tomlinson's method of arrangement is open to serious criticism—it is, in fact, no arrangement at all, the author passing from one topic to another in a bewildering and most unsatisfactory manner. He first classifies the bulk of Italian sonnets according to their scheme of rhyme, concludes from the prevailing order that the sonnet is a poem of regular construction, then digresses into its history, but while not yet fairly launched strikes the *sestina* and pauses to communicate the discovery of its arrangement made by himself and his mathematical friend. He then resumes his historical disquisition to make the remarkable statement that the regular sonnet was used as early as 1321, such a sonnet being written by Guglielmo degli Amalricchi in honor of Robert, King of Naples. From the context it seems likely that the author refers to the sonnet in Provençal, where, it is needless to say, it never existed. In the next line the sonnet is mentioned as perfected by various poets, among them Fra Guittone d'Arezzo, who died in 1294.

The remainder of the work is occupied with the classification and translation of sonnets of Dante and Petrarch, and with rambling remarks and criticisms of the work of others in this field. Many of the translations are accompanied by extracts from the older commentators, from two of whom, Tassoni and Muratori, Mr. Tomlinson has drawn freely. His own comments are not always to the point, as on p. 157, where he makes a curious mistake in regard to "'l terzo cerchio," mentioned in the sonnet, "Levommi il mio pensier in parte ov' era." He says: "There are also curious speculations about the third heaven, 'l terzo cerchio,' which was probably suggested to the poet by St. Paul (2 Cor. xxi. 2)." A very slight acquaintance with Dante should suffice to discover that the third heaven meant here is that of Venus, inhabited by the spirits of lovers. Mr. Tomlinson gives a very slight and disappointing account of the sonnet in England, omitting all reference to its importance in Spain, Portugal, and Germany. Our author's versions are in general accurate and smooth, and will convey to any one unacquainted with Italian a very fair idea of the best examples of the great master of the sonnet.

Mr. Tomlinson might confer a favor upon English readers by giving them, without any extraneous matter, a collection of the best sonnets arranged as far as possible in chronological order, with brief explanations of the difficult passages—in short, a comment like that of Giacomo Leopardi on Petrarch.

---

*Fusang;* or, The Discovery of America by Chinese Buddhist Priests in the Fifth Century. By Charles G. Leland. (New York: J. W. Bouton. 1875. 12mo, pp. 212).—The substance of this book is made up of the narrative of the Buddhist priest Hoei-shin, translated, with comments, by the late Prof. Neumann of Munich. There follow then further comments by Mr. Leland, and other documents and papers bearing upon the subject. The material of the book is interesting and valuable, but there is a curious confusion in the arrangement. It takes some study to determine just what belongs to Hoei-shin, what to Neumann, and what to Leland; and, what is worse, when this is done, we confess ourselves unable to make up our minds just how much is proved and how much is mere inference. Fusang, as we make out from the original document on page 25, is "twenty thousand Chinese miles in an easterly direction from Tahan." Tahan, again, Prof. Neumann tells us (p. 24), is five thousand miles east of the Painted People, and these Painted People are, says the 'Year-Book of the Southern Dynasty,' "about seven thousand Chinese miles (or twenty of our geographical degrees) to the northeast of Japan, a direction and distance which places us in the midst of the Aleutian or Fox group of islands" (p. 22). This country was visited by the Buddhist missionary, Hoei-shin, and he gives an account of some of its institutions and manners and customs, which have some resemblances to those of Mexico—an identification which the above-given distances might also support. The name *Fusang* is that of a Chinese malvaceous plant (p. 162), and is applied to this country because of its abundance there; but inasmuch as the real *Fusang* is not found in America, Prof. Neumann is obliged to suppose (p. 37) either that it once existed here and became extinct, or that the name is applied to a plant which it merely resembles, just as the settlers of America gave the name *walnut* (Juglans) to the *hickory* (Carya). Therefore he makes the rather wild suggestion of the *maguey*, or American aloe, which bears no resemblance to the Fusang, except that it "supplies as many wants in Mexico as the original Fusang is said to do in Eastern Asia." It is hard to argue either for or against a theory which is built on such a very improbable hypothesis as this; for the rest, the arguments adduced have considerable weight, and considerable space is occupied by some chapters which discuss the practicability and the probability of an early communication between Asia and America, and the settling of America by the way of Behring's Straits. This is a subject which cannot be said to bear directly upon the main topic of the book. A settlement is one thing and a missionary enterprise is another; arguments for either may make the other more probable, but they are hardly likely to be both true.

The looseness of reasoning and carelessness of expression which injure the argument very materially, are illustrated in many little occasional points. Hoei-shin is made, for instance, to speak (p. 25) of the *Dryanda cordifolia*, which the Fusang-tree resembles in its leaves, and we are left to

guess that by this is meant the Chinese Fusang, although we gather from Dr. Bretschneider's expressions (p. 171) that it is a quite different plant. Again, on page 15, *Lieu-kuei* is identified with Kamtschatka ; and on the next page a translation from the Chinese Year-Books begins, "Lieu-kuei lies, etc." But a few lines below the name *Kamtschatka* is introduced as if it stood thus in the original. There is a good deal of this slovenly kind of expression.

*Schiller's Die Piccolomini.* Edited with an introduction, commentary, index of persons and places, and map of Germany, by James Morgan Hart. (New York : G. P. Putnam's Sons. 1875.)—This is the second number of the series of German Classics undertaken by Mr. Hart and his publishers, and it deserves all the praise we gave to the 'Hermann und Dorothea' which preceded it. It deserves higher praise, in fact, for, while the text is just as carefully printed, the editing shows an even greater diligence of research, and is still more suggestive of German thoroughness and conscientiousness. The introduction alone, clearly and entertainingly written, occupies sixty pages. The student continues to be well served in the commentary. In short, there is no falling-off in quality or in quantity, and for such an enterprise this is a most hopeful augury. We have but a single criticism to make of the present volume, and that is that the reader is not reminded of the metrical translations by Coleridge and Carlyle of the 'Piccolomini' and other parts of the Wallenstein trilogy.

*Wooden and Brick Buildings,* with details. 160 plates of plans, elevations, etc., etc. 2 vols. large quarto. (New York : A. J. Bicknell & Co.) —The printed testimonials which accompany this work seem to indicate that it was intended for architects and builders ; and it may do them the same sort of good that they derive from the Architectural Sketch-books which have sprung up since the heliotype process was introduced by Messrs. Osgood & Co. In these periodicals, however, some attempt is made by the editors to keep out crude material, and to save the profession from the disrepute into which an indiscriminate admission of *soi-disant* architects' drawings would tend to bring it. In the volumes before us, the designs of some of the best and some of the poorest architects in the country are figured side by side, without any aid to the uncultivated judgment except what is furnished by the names respectively attached to them. There is reason to fear, therefore, that this collection of plates will not hasten the ascendancy of sound taste and sound reason in building ; that it will embolden builders to pass as architects sooner than it will diffuse higher ideals among the latter ; and that, so far as it falls into the hands of the public, it will probably mislead instead of educating, and promote senseless copying, in which the worst model is more likely to be chosen than the best. Regarded as a mere advertisement for the contributing architects, it is defective just so far as it supplies no reason why they happen to be represented in it, and no guarantee (such as the sketch-books presumptively afford) that their best efforts are here exhibited. Most of the plates are left to explain themselves. Against some few, with no apparent rule, the architect has set a brief description or commendation of his design, and occasionally the specifications are added in full. At the end of the second volume the New York form of contract is given, and this is followed by the Institute's schedule of charges, etc.

The basis of all good building is construction, and there can be no rational architecture where this is subordinated to the plan or to the outward appearance. Neglect of it lies at the root of the general failure in this country to produce work not only of a high order, but safe and lasting, and not calling for endless repairs ; and ignorance or disregard of it leads to that too common straining after effect which results in a false and absurd originality, and which is opposed to the growth of a genuinely characteristic school of architecture—call it modern or national. We improve this opportunity, therefore, to recommend to architects, builders, and the public the 'Notes on Building Construction, arranged to meet the requirements of the syllabus of the science and art department of the committee of council on education, South Kensington' (London : Rivingtons ; Philadelphia : J. B. Lippincott & Co.) Part I. only, being the first stage or elementary course, has thus far reached us. It is beautifully printed and clearly and freely illustrated. The technical terms do not always correspond to those in use among us, but this is no bar to understanding the principles of honest construction as set forth in the book.

BOOKS OF THE WEEK.

| *Authors.—Titles.* | *Publishers.—Prices* |
|---|---|
| Anderson (Prof. R. B.), Norse Mythology | (S. C. Griggs & Co.) $2 50 |

L. W. SCHMIDT, 24 Barclay St., N. Y.

*The Birds of North America.*

*A HISTORY OF NORTH AMERICAN* Birds. By Spencer F. Baird, T. M. Brewer, and Robert Ridgway. Land Birds Illustrated by 64 Plates and 593 woodcuts. 3 vols. 4to, cloth, $30 ; with plates colored by hand, $60.

Dr. Otto Finsch, Ornithological Curator of the Bremen Museum, pronounces this magnificent work one "which will ever remain a principal source of our knowledge of North American Birds, and for which there will not be wanting friends and admirers in Germany." Again, he says it "will form for all time to come a standard work."

"Taken as a whole, it is not too much to say that the work is the most thorough and complete account the world now possesses of the ornithology of a region so extended."—*Boston Advertiser.*

LITTLE, BROWN & CO., Publishers,
254 Washington Street, Boston.

W. P. NIMMO'S BOOKS.

Messrs. Cassell, Petter & Galpin announce with great pleasure that they are appointed sole Agents in the United States for the above important Catalogue of Publications.

Subscription Books open daily.
Circulars only at the Conservatory.

# The Nation.

*NEW YORK, THURSDAY, SEPTEMBER 2, 1875.*

## The Week.

THE business world was startled on Friday morning by the announcement that the Bank of California had, just previous to the close of bank hours the day before, stopped payment. This was followed on Saturday morning by the news that Mr. Ralston, the president of the bank, had suddenly died while bathing on the evening of Friday; whether he took his own life, or whether the death was natural, is a question in dispute. To those familiar with San Francisco speculations and the extent to which Mr. Ralston was involved in them, the failure of the bank was no surprise; but to the great majority, who regarded the bank as the representative financial institution of the Pacific coast—a section of the country which had escaped the evils attendant on the use of an irredeemable paper currency—the stoppage of the bank was shocking. San Francisco was thrown into a panic, and two other institutions—the Merchants' Exchange Bank and the National Gold Bank and Trust Company—closed their doors. The exchanges were closed, and many minor suspensions occurred. The news from California since the failure has been meagre, and the extent of the effects of the panic there is not yet known. The real condition of the affairs of the Bank of California is still a matter of conjecture. All accounts concede that the liabilities of the bank were from two to three times its capital, and much larger than capital and other assets combined, and that if the creditors of the bank are to be protected it will be by reason of advances of the stockholders, who are known to be men of ample ability to pay in full every debt of the bank. The effect of the failure on this side of the Rocky Mountains was light, and there was no reason why it should have been otherwise. The causes of the failure are more clearly apparent. Mr. Ralston, a born speculator and accomplished in all the arts of speculation, was identified with nearly every speculative enterprise of the coast; in short, he was widely "extended," and his control had involved the bank in his speculations to a sufficient extent to impair its credit. Besides, in his speculative campaigns, he had incurred the enmity of other speculative capitalists, who, there is every reason to believe, combined to effect the overthrow of the bank, knowing well that with its downfall his power was for ever broken. A depositors' run on the bank was started, and its unsoundness was demonstrated in less than forty-eight hours. The failure was the result simply of illegitimate banking, of a spirit of speculation which in a country like California was kept alive and ablaze by mining discoveries and the excitement incident thereto, instead of by the uncertainties of a fluctuating currency. In addition to the Bank of California suspension came that of a large mercantile house in Baltimore—Stirling, Ahrens & Co.—a firm which did an extensive business in the importation and refining of sugar. Its liabilities exceed $2,000,000, and the losses fall for the most part directly on Baltimore. Other minor failures have occurred, so that the week has been notable in this respect.

---

Notwithstanding these failures, the outlook in regard to the autumn trade is far from discouraging, and merchants are hopeful. Both the South and the West have full crops, and the West has the advantage of high prices for its products. The new crop of cotton is estimated at from 4,250,000 to 4,500,000 bales; and in addition to this great advantage is the scarcely less important one that the political condition of the Southern States is more settled than for years. The stock of manufactured goods in the hands of distributors in the agricultural sections is not large, and, with the need and the means to replenish, it is naturally expected that there will be a large distribution of goods. The manufacturing interests of the country can, of course, not be improved until after the present overstock of goods in their hands or those of their agents is removed; but, with the agricultural interest flourishing, this is only a matter of time. The money market is becoming firmer, but the New York banks begin the autumn with a surplus reserve of over $20,000,000, so that there is no reason to expect an oppressive restriction in bank facilities. In Wall Street speculation was tame until the latter part of the week, when there was a break-down in Western Union Telegraph and one or two other speculative shares. Gold advanced during the week about one "point," and for a variety of reasons. The Bank of California failure, and the panic in San Francisco which followed, induced the transfer of about $2,000,000 gold from New York; a decline of consols in London, because of talk of complications between Great Britain and China, had its influence.

---

The "soft-money men" held their expected convention at Detroit last week. The attendance was expected, it is said, to reach 10,000, but only 600 persons were present, and the proceedings were languid. The principal speaker was Mr. Kelley, and there was a letter from Henry C. Carey. The resolutions were of a very extraordinary character. They declared that the people ought to lend the Government money at a low rate of interest; that the Government ought to supply the people with "a safe and uniform currency"; and that the volume of this currency ought to be adequate "to the requirements of the country," but they did not mention what these requirements are; denied that the "soft-money men" were repudiationists or inflationists, and affirmed that they simply advocated the redemption of greenbacks in bonds, and of bonds in greenbacks, but did not acknowledge their obligations for this idea to Mr. Wilkins Micawber, formerly of London, and afterwards of Australia; advocated the issue of Kelley's 3-65 bonds to the whole amount of the Government debt, to be changed and exchanged for greenbacks on the Micawber plan; the payment of all debts of the country in legal-tenders, except bonds made payable in coin; demanded the immediate repeal of the specie-resumption bill of January, 1875; declared that the currency would render the country "independent financially of foreign influence and complications," and not subject to "the disturbing control or influence" of the Hwang-tse or foreign devils; and called for greenback clubs to push the Micawber idea. There has been so much discussion of these matters already, that, without meaning any disrespect to Mr. Micawber, we shall make no comment on the resolutions.

---

"The Scholar" has been making some disturbance in "politics" during the week. The Milwaukee *Sentinel* takes up the case of Professor Anderson of the Wisconsin State University, of which Mr. Bishop of Milwaukee gave some account in a recent number of the *Nation*, and offers various reasons, of the accuracy of which we cannot judge, for the selection of Mr. Warner for the Secretaryship of State; says he is not only of Norwegian parentage, but was born in Norway; that he is not illiterate, but is "master of the English as well as of his own language, and of all the branches taught in our common schools"; and that instead of being "rather disreputable," he is highly esteemed by the people of his county. It also adds that Professor Anderson is wanting in judgment, but admits that Mr. Barron, the Regent, met him at the Capitol, and "quietly suggested to him that it might injure the State University if a professor were seen dictating to a political convention whom it should and whom it should not nominate." It does not mention, however, what we believe is true, that Mr. Barron tried to get Professor Anderson removed from his professorship, nor does it notice the assertion of a correspondent of the Madison *Democrat*, that the worthy Mr. Barron himself, after protesting pathetically on behalf of "the poor man" in the Assembly against having the land granted by Congress

to the State University appraised at more than a dollar and a quarter an acre, he being a Regent of the University at the time, entered 69,000 acres of it himself a few weeks later, which he has since been selling to "the poor man" at from $5 to $10 an acre. This, if true, is far worse than "dictating to a political convention."

---

The affair also drew forth a letter from Professor Sumner, of Yale, who is himself a "scholar in politics," and who says in substance, as the result of his experience, that politics is unpleasant for the Scholar, but that nevertheless he ought to go into it. The letter would have been more valuable if it had gone into details, but it called forth from the Springfield *Republican* some approving remarks, which closed with an expression of opinion that New Haven politics with Postmaster Sperry and Congressman Kellogg is a wretched place for the Scholar, and that in any case politics can do very well without him, the country being really very well taken care of by "ungrammatical common people," who know nothing about political economy and Greek conjugations. We must remind the *Republican*, which is nothing if not "practical," that to find a match for the plan of saving the country through Horace Greeley, superintended by Mr. Fenton and General John Cochrane, with the Sermon on the Mount for a platform—a plan which the *Republican* highly approved—one would have to go, not to colleges or libraries, but to kindergartens. It is not everybody who can afford to be hard on the Scholar.

---

The Republicans in New York seem to be making a serious mistake in their attacks on Mr. Tilden and his Canal Reform. That Mr. Tilden is a politician, and has in times past had some very queer political associates, there can be no doubt, but there is no doubt either that his movement against the "Canal thieves" bears all the marks of an honest attempt to rid the State of a great abuse. His investigating commission is, of some hundreds which have been investigating abuses during the past few years, the first which has succeeded in getting any money back from the people who have defrauded the public. Twelve thousand dollars is not much, to be sure, but it is a good deal more than has ever been restored by Tweed. The work of the commission, too, in making its enquiries into the frauds, has been very thorough, and conducted in the manner of a judicial investigation, rather than in the loose and disconnected way in which such matters are generally managed. They have not allowed State officials implicated in the negligence by which the frauds were made possible to go about denying their culpability and accusing the commissioners of ignorance and incapacity, and declaiming against the evil tendencies of the times which permit the slander of our best men to go unrebuked; but they have, in all such cases, summoned the officials before them, and called upon them to make good their denials, which has in no case been successfully attempted. Honest and able investigations, followed immediately by clear reports and by suits for restitution, are what most people suppose Canal reform to mean, and that such reform as this is all a sham, like the platitudes of a convention, is beyond belief. If the Republicans really have any hope of getting control of the State again, there is only one way for them to do it, and that is by going to work and showing, at Washington and in the Custom-houses, that they are better reformers than the Democrats. This, however, takes time and trouble; it is a great deal easier to denounce Tilden for his hypocrisy and for being the "tool" of the "Boss."

---

The Enforcement Acts provide in general terms for the criminal prosecution of any two or more persons who unite, combine, and conspire together to obstruct and hinder the execution of the processes of the courts. It would seem as if the Attorney-General would have to begin proceedings under them very soon against the proprietors of the *Tribune*, Judge Daniels of the Supreme Court, and Mr. A. G. Browne, jr., who have formed a combination or conspiracy to render null and void the judgment of the Court of Appeals in the Tweed case. Judge Daniels has just rendered a decision in a habeas-corpus proceeding, in which he admits that the Tweed case must be good law, but declines to apply it, on the ground, apparently, that the consequences would be bad. The *Tribune*, on the other hand, has printed a letter from Mr. Browne in which that gentleman (a lawyer of established reputation) says that in the case of Suydam *v.* Smith (52 New York 383), the Court decided exactly the opposite of what it had laid down in the Fisher decision cited by Mr. O'Conor. The persons who make these shameful attacks on this venerable bench should remember that any little inconsistency they may discover in its decision is probably due to the political character of these jurists. Without going so far as to say that all important cases, like the legal-tender suits and the Tweed case, ought to be decided in favor of both plaintiff and defendant, it is clear that a judge actively in politics who, when accused of having decided a case in a particular way, can immediately produce a decision made about the same time directly the opposite way, has many points in his favor before the people.

---

The New Jersey constitutional amendments, which are to be voted on in a fortnight, provide against any loan of money or credit by cities and towns to individuals or corporations, make the pay of legislators an annual salary, forbid special legislation, and give the governor the right to veto parts of an appropriation bill while approving others. These amendments were drawn up by a constitutional commission, and are all good. We should be glad to see in some State the experiment tried of allowing the governor to dismiss the legislature for cause shown. Though probably this would seem to most constitutional reformers something like a reintroduction of "monarchical" prerogative, there would really be nothing dangerous in it, and it would not be nearly so great a blow at the sovereignty of the legislature as many other reforms actually adopted and found to work well. The threat of dissolution held over the head of a corrupt and slothful legislature might prevent the scandal to which its sense of irresponsible power frequently gives rise. As an illustration of the value of restrictions on loans, State or municipal, we may refer to to the very striking instance of the State of New York. The constitution of the State contains very stringent clauses to keep the State debt within limits, while the city of New York has been left to take care of itself. Both State and city have been constantly plundered by contractors and statesmen of every stripe; but the State debt to-day may be said hardly to exist, while the city owes a hundred and twenty-five millions at least, and her debt is steadily increasing.

---

The Georgia "insurrection" has subsided almost as suddenly as it arose, the number of Georgians slaughtered, as is common in such cases, being one negro, who is supposed to have been killed in a squabble with some of his own race. A large number of desperate characters, however, have been arrested and lodged in jail, and the grand jury has been charged by Judge Herschel V. Johnson with regard to them. The black-hearted villany of the South comes out very plainly in his charge. He begins by telling the grand jury that he has been advised of a "plot of insurrection," and has ordered a full investigation into all the circumstances. He then gives legal definitions of insurrection and attempts to incite insurrection, cautioning the jury not to be guided by suspicion, rumor, or hearsay. He warns them, too, against exaggerating the enormity of the crime, or allowing any consideration of color to affect their minds, reminding them that they must "ignore the fact that the accused are negroes" or "that they were ever slaves." The explanation of this extraordinary behavior is not, as some foolish enthusiasts would have us believe, a growing spirit of fairness and good-sense at the South, but a deep-laid conspiracy on the part of the Georgia "banditti" to murder all the negroes and Union men, meanwhile keeping themselves beyond the reach of Ku-klux law by a great display of moderation and desire for justice. The wretched tyrants are now conscious

that the eyes of the North are upon them, and, like the bandits of the stage, the judge, the sheriff, and the grand jury have come to the conclusion that they are "observed" and must "dissemble."

---

Colonel Baker has been peremptorily dismissed from the army, with the usual formula—it is said by the interference of the Queen, who put an end to the waverings of the Commander-in-chief's Office on the point of allowing him to resign. The delay in announcing this decision, combined with the lightness of the judicial sentence, excited a good deal of dissatisfaction, which found expression in the radical press, and with a good deal of force, the special point of complaint being his treatment as a "first-class misdemeanant" and exemption from all the hardships and degradation of prison life—from everything, in fact, except confinement. The dismissal from the service, however, completes his ruin, as it will prevent his finding employment in any foreign army, besides driving him out of society at home, and ought, even if he is not a very sensitive man, to kill him. There is some slight connection between this incident and the career of Kenealy, which appears to be rapidly approaching its close also. One of his own "Magna Charta Associations," and that the largest, has turned upon him and denounced him savagely for his bad temper, want of judgment, and tyrannical disposition, and, worse than all, accuses him of pocketing "the people's pence," without rendering any accounts or having any responsible treasurer.

---

The trouble in Herzegovina does not seem to abate, and there are rumors of the entrance of reinforcements from Dalmatia and Croatia, and of various reverses to the Turkish troops. But as all this news is collected at Trieste, and comes down from the mountains in the mouths of peasants, it is not very trustworthy. There appears to be little doubt, however, that the Turkish troops on the spot do not make much headway; that, in the absence of railways, reinforcements reach them very slowly; and that those going by sea, by way of Kleck, find difficulty in penetrating the defiles into the mountains; that the Servians have put an army corps "in observation" on the frontier, which, though it looks like a precaution in the interest of peace, operates as an encouragement to the insurgents, and has had the effect of causing excitement among the Servians themselves; that there is danger of popular pressure being brought to bear on Prince Milan in favor of interference, but that nothing of the kind will be permitted by Austria; that the whole affair is having a very serious effect on Turkish credit, and that there is still talk of mediation.

---

The Sultan has at last, or rather has again, apparently been impressed with the necessity of putting his affairs in order. He has announced his intention of contributing $2,000,000 out of his civil list this year towards the cost of making a railroad to Bagdad, and in fact has agreed to cut the civil list down permanently from about $6,000,000 a year to less than $5,000,000. A reduction has been made too in all the other official salaries, the Grand Vizier losing one-third of his. Another measure proposed is what is called "the secularization of the Vakoufs," or lands belonging to the mosques under a singular form of endowment. This endowment consists in the consecration to the service of the mosque of a piece of land by the owner, who, however, does not surrender the possession of it, nor does the mosque come into possession of it until his descendants in the direct line are extinct, but from the moment of the gift the property becomes exempt from taxation and strictly entailed. No holder can afterwards alienate it, and the state cannot tax it. The consequence is that an enormous extent of real estate has thus been withdrawn from taxation, and the desire to prevent the property from lapsing by the extinction of the founder's family has long been a fruitful source of fraud. It is now proposed to give the present holders a release from the entail on the direct heirs, and to allow its descent in the collateral line on the payment of a fine. This is not likely to bring in much if any money, first, because the holders of Vakoufs are generally poor and unenterprising; secondly, because those who have direct heirs would not see the use of barring the entail; and, thirdly, because those who have not would hardly ever care enough about the collateral branch to be willing to pay money for its benefit. Reforms in the direct taxation are also in contemplation, such as the commutation of the tithes now levied on produce for a fixed money payment, but then this could fairly be carried out only through a small portion of the empire. Through most of it the absence of roads deprives the farmer of access to any market not within a few miles of his home, and to ask him to pay in cash, therefore, would be asking an impossibility. The deficit last year was $1,500,000, which may not seem large, but is likely to be larger this year. The prospect of a financial collapse naturally adds fresh interest to the troubles in Herzegovina.

---

The connection of Turkish finance with Indian finance is apparently very remote, and yet it is in reality by no means remote. A breakdown in the former might be the means of bringing Russia and England once more face to face on the Eastern Question, and the collision would seriously aggravate the anxiety already felt among English politicians about the Russian advances in Central Asia, and in a scarcely less degree about the condition of native Indian opinion. In a debate in the House of Commons brought on about two months ago by Mr. Baillie Cochrane, Sir George Mackenzie, who long held a high administrative position in the Northwestern Provinces, showed conclusively that nothing could be done either by arms or diplomacy in Afghanistan to arrest or prepare for a Russian attempt, for instance, on Herat, and that there was nothing for it but to await events. It is, however, admitted on all sides that there is not much to be feared from Russian arms, as the British can meet any force with which they can cross the mountains with a force far more effective; but that there is, in the present state of Indian feeling, great danger from the effect of Russian influence. The very efforts which England has made to promote civilization in India, and which have been wonderfully fruitful, seem to be working her evil, for with the moral and mental elevation of the natives has come growing discontent with foreign rule and with various kinds of inequality, such as the difference in the pay of English and native officials. This discontent now begins to show itself with considerable boldness in the native press and theatre, and it is very puzzling. British rule is the best rule India has ever had. Her grievances are sentimental mainly, but sentimental grievances are just the ones with which Englishmen find it most difficult to deal. One little incident which has just occurred shows how delicate the relations of the two communities are becoming. The cheating of the Manchester manufacturers in the quality of their goods has led some native capitalists to import machinery and start mills at home, which have proved eminently successful, and, with the aid of cheap labor and the import duties now levied, they are able to beat the coarser English fabrics out of the market. Whereupon some of the Manchester men have called on the Government to lower the duties; and very cool observers, who have little sympathy with the Manchester men, such as the *Economist*, are urging the Government to do so, because it is well known that they are not to be, and were never intended to be, kept up longer than there was absolute need for the money they bring in, and that "it can conceive nothing more dangerous to the incipient industry of a country than to attract capital temporarily into a trade by artificial bounties and then withdraw the aid so given." This is true; but the matter has a political as well as an economical bearing, and there is now the danger that a reduction of the duties will, under present circumstances, be looked on by the natives as a sacrifice of their interests to those of their British competitors in trade.

## THE CRASH AT SAN FRANCISCO.

THE effects of the panic at San Francisco upon affairs at the East are apparently likely to be so slight, and it finds the public mind so hardened to financial disasters, that there will probably be much less philosophizing over it than the magnitude of the disaster would lead one to expect. But it throws some light which is worth attention on problems now under discussion at the East. It is not impossible that some of the half-witted advocates of irredeemable paper may see in it proof of the worthlessness of coin as a circulating medium, and will observe at their meetings in a fatuous way that we now perceive that specie furnishes no protection against panics; to which the reply is, that nobody has said it did. In fact, nearly all the great panics in commercial history occurred "on a specie basis." What *was* said by the friends of the greenback was, however, that, being a non-exportable money, *it* would furnish protection against panics, and this was never said with so much confidence as in the winter of 1872–3, on the eve of a very great panic. It is now established pretty effectually that we are at least just as much exposed to commercial crises under irredeemable as under redeemable paper. The friends of hard money, however, go further than this, and say that inasmuch as the constant fluctuation of values under a paper standard gives trade an aleatory character, it increases the spirit of speculation in a greater degree than hard money, and in so far as it does this is more likely to produce panics than hard money.

But, as we have before now pointed out in these columns, it is not so much in the production of panics as in the recovery from them that the evils of an irredeemable paper currency and the advantages of hard money are seen; and of this we have no doubt the California catastrophe is going to furnish another striking illustration. After a panic under an irredeemable currency, when men come to put their affairs in order, wipe out old scores, and try to make a fresh start, they find themselves met at the very outset by a clamorous demand from that part of the community which has goods for sale or debts to pay, that the standard of value shall be changed in the interest of "the debtor class"; or, in other words, that the very foundations on which trade rests shall be taken up and laid anew. At a time when the uncertainty caused by a general collapse of credit is at its height, and is filling men's hearts with fear, they find themselves threatened with the loss of the only instrument by which they can ascertain the value either of their own property or of anybody else's. In the midst of a gale, with the sails flying from the yards, the ship on her beam-ends, a part of the crew insists on throwing the compass and sextant overboard, and steering by the stars and dead-reckoning. Through this last experience we at the East are now passing. Under a specie régime, no such aggravation of a panic is possible. When the first burst of alarm is over, and people look to see where they are, and in what manner they shall begin anew, they find the gold standard still untouched, and by its aid they find out exactly what they are worth, and what their debtors are worth, and in making settlements are able to tell exactly what they will receive or what they will have to pay one year or ten years hence. The advantage of this in clearing away the rubbish of overspeculation is simply incalculable. In the great crisis of 1837, and again in the great crisis of 1857, we had this advantage. When the squall was over, and men began to examine the ruins, they were not met by crowds of blatherskite orators inviting them to settle their debts in bits of paper, and pointing out the untold riches which lay in calling every pint a quart, or every yard a yard and a half. The bank currency went, but all debts and all property were estimated in gold and silver. In the present crisis, on the other hand, we do not possess this advantage, and hence the slowness of our recovery. Every debtor wants to settle in a different kind of money, and some in new money got up for the occasion. Every month some quack appears on the scene with a new standard of value, manufactured by a patent process of his own, and gets a parcel of politicians to promise to have its use made compulsory on all citizens. It is no wonder that under these circumstances people are afraid to go into any new business, and are longing to get safely out of the old ones, and are letting their money lie idle in the bank, where it is likely to do least mischief and expose them to fewest risks.

From these evils the Californians, owing to their clinging to the specie standard, will escape. Now, when they begin to settle old scores, they will settle on a fixed basis, which politicians cannot shake or alter. Everybody knows what his debtor's assets are worth and what they will be worth, other things remaining the same, a year or five years hence. He has not, in winding up his old ventures, to keep an eye on Kelley, or Allen, or Sam Cary, or George H. Pendleton, or to find out what Thurman is thinking, or what Morton or Logan is up to. The rant and speculation of all these eminent thinkers and economists will pass him by like the idle wind. About the 3-65 scheme, and the land-bank, and "the poor man's money," and the "people's money," and "the blood-stained, battle-born money," he will not trouble his head. He will listen, not for the melodious notes of the inflationist oratory, but for the chink of United States dollars, and on them, and not on the vapid speculations of half-cracked demagogues, he will seek to rebuild his prosperity. One other advantage the Californians will have of which we here can know nothing. It is said, though we do not believe it, that the Bank of California failed because gold coin was scarce; the real reason was the common one —its inability to pay its debts. But supposing gold coin to be overscarce in California, scarcer than the needs of commerce require, and the people demand it, and are willing to sell their property to procure it, back it will come from Europe as fast as it is wanted, and when it comes *it will go into the circulation.* The Californians will not witness the extraordinary spectacle which was witnessed in this city during the panic in 1873, of gold arriving in large quantities from Europe to lie in bank, at a moment when the banks were paying their depositors in certified checks for want of currency.

But for nothing is the Californian crisis more valuable than for the illustration it affords of the danger of "basing" credit on things which cannot be readily turned into coin. To put money into things which it cannot be taken out of at short notice has long been recognized as the very essence of bad banking. Nearly all great bank failures have occurred from this course. No bank which issues notes and takes money on deposit, payable on demand, can help enterprises from which returns come in slowly, if at all, except at the peril of its life. Therefore, attempts on the part of banks to aid in "developing the material resources of the country" are simply mad. This is the business of capitalists, not of banks. The temptations it offers to bankers whose heads are not strong, or who are intoxicated with the fumes of success, are often irresistible, particularly in this country, where schemes "with millions in them" are so common. Nevertheless, it is in this business that the Bank of San Francisco, or rather its president, seems to have engaged, and he has perished as scores of others have perished before him. But at the bottom of this rashness, perhaps on his part, and unquestionably on the part of many others who have come to grief in the same way, there lay a hallucination which shows itself constantly in the speeches of the paper-money quacks, viz., the notion that so long as your paper represents property, or, as they say, is "based" on property, which has or may some day have value, you cannot make a mistake in issuing it. The Bank of California was in this way "based" on mines and canals and railroads and hotels which it had used its funds in working, and therefore, according to our currency doctors, it ought not to have failed. They have, in fact, used the term "base" so much, and have in using it so rapidly extended its meaning, that the connection they make between promises to pay and the thing they are "based" on, is often simply one of mental association. They often talk about "basing" as if they thought that a man might, if he saw a cow worth $50 passing his window, give his note to a creditor for that sum "based" on the cow, on the simple condition of informing the creditor of the nature of the transaction and without having any property in the cow whatever,

or without her having any connection with the note beyond suggesting its amount. The scheme of having the Government issue notes based "on the entire wealth of the country" is hardly more rational than the issue of notes by private citizens "based on" other people's cows. The "entire wealth of the country" not being in the least degree available for the payment of the notes, not being salable or in any manner disposable in satisfaction of them, they might as well be "based on" the crown jewels of England or the guano of Peru. All "basing" of credit, or promises to pay money on demand, on anything not immediately convertible into cash, is in fact a delusion which is at the root of all bad currency schemes and all bad banking. Analyze any of the great national or banking swindles or collapses of the last two hundred years, and we shall find that they have consisted principally in "basing" obligations to pay money on something not immediately salable for coin—sometimes hopes, sometimes land, sometimes railroads, and sometimes buildings or bridges. The final form of the craze is the issue of national currency, secured by something over which the Government has no control, and which it could not sell if it tried. "Basing" is, in fact, the great madness of the times.

## THE FARMER AS A "MEDIÆVAL BARON."

WHEN the Grangers and their friends were, after the panic, driven to extremities in their efforts to describe the enormous, flagitious, and high-handed greed of the Railroad Bondholder and Stock Speculator, and words failed them in direct recital of his crimes, they resorted to analogy, or, as they would say in Brooklyn, to an "allegory." They said that anybody who wanted to receive a distinct impression of the Bondholder must study the history of the Middle Ages, and make himself familiar with the manners and customs of the robber barons of that sad period, who used to sally forth from their strongholds on fine mornings and truss peaceful travellers on the highways, or bastinado the poor serfs down at the village in the hollow. If, on the other hand, anybody wished to receive a distinct impression of the Farmer who lives along the lines of road in the West, and travels on them, or sends his produce to market by them, he should read La Bruyère's and other contemporary accounts of the French peasantry before the Revolution, the brown, filthy, long-haired, greasy, stooped, leather-skinned, and ferocious-looking apes who passed in the French fields for men and women. We are not jesting about this. This comparison was seriously made in a paper read before the Social Science Association by a prominent champion of the Farmer, and he was invited by the president of one of our leading colleges to repeat it before the students, as a noteworthy, if not accurate, picture of American agricultural society less than two years ago, and the Granger newspapers and lecturers took greatly to the simile. The Mediæval Baron and the Degraded Serf of poor old Europe were reported at all the conventions as having established themselves west of the Alleghanies in spite of the Constitution and the fifteen Amendments, and might be seen by anybody who chose to hire a buggy and drive out on the prairie. The serf could always be found either ploughing in his fields or reading the newspapers in his own parlor, and the Baron's man-at-arms stood on guard at the railroad station, levying the dues for his lord.

To the surprise and pain of the Eastern public, however, accounts are coming in every day which seem to indicate that the Farmer has got tired of being a Serf, and has himself become a Mediæval Baron. Now, as a Serf, he was simply unfortunate; but as a Baron he is immoral. It is unpleasant to be robbed and bastinadoed, but not wicked; while to rob and cudgel is sinful in the highest degree. Nevertheless, it does really seem as if our old friend was tired of his humble but virtuous rôle as a hind, or villein, and had converted himself at one bound into a high-handed and ruthless lord, and as if he had either reduced the Bondholder to serfdom, or had cooped him up in the walled towns, and stripped him carefully every time he ventured outside. The stories about him in this new character are now so numerous that we can hardly doubt their general accuracy. To some of them, in which he is represented as extracting money from the Bondholder for town and county improvements, ostensibly as a loan, just as his mediæval prototype used to extract it from Isaac of York and Moses of Seville, and then laugh at him and pull his beard when he asked for repayment, we have already called attention. The most recent example has occurred in Mason County, Illinois, where the local Barons got the Bondholder to advance money to make a levee to keep the river from overflowing their lands, and gave him in return county bonds, which professed to be "based" on assessments laid on the property that was benefited by the embankment. That the Bondholders should not have known that such bonds were illegal under the new constitution, and would bind neither the county nor anybody else, seems doubtless very extraordinary; but what can one expect from a Serf? That the Barons knew, we have not the least doubt, and that they joked and laughed over the operation in their castles on the prairie, we have just as little. Accordingly, when the Bondholder asked for his money, he was told with a chuckle that the issue of the bonds was unconstitutional, and that he must take himself off. To be sure, they had got the money, and the lands were drained, and the owners were reaping the fruits of the outlay, but the Barons do not expect to be called on to repay loans or surrender plunder. If they were compelled to do so, where would be the use of being a Baron?

The Bondholder is having another very curious experience down in Alabama. The Barons there determined to treat themselves to one of those modern contrivances called a railroad, to wit, "The Alabama and Chattanooga" line. So they got a number of English and Dutch money-lenders to advance them nearly $5,000,000 in 1869 on the security of first-mortgage bonds, guaranteed by the State Government, which were put on the London market by the aid of prospectuses containing several false statements upon important points. On the first of January, 1871, the company in due course defaulted in the payment of the interest. This and the interest of the following July were then paid by the State, according to contract, and it took possession of the road. In the following September the road was put into bankruptcy and sold under an order of the Court to the State of Alabama, which began to try to sell it to somebody else. In the meantime another Court appointed a receiver of the property, nominally in the interest of the mortgagees, and with "extensive borrowing powers." In the following January the State also made default on the interest on the bonds, and having failed to pay the small amount in cash due on its purchase of the road from the Bankruptcy Court—about $235,000—the Court threatened to sell the road again to the highest bidder, without regard to the first-mortgages, unless the money was put up by somebody. So the first-mortgage bondholders met in great alarm, and agreed to advance the amount needed, $250,000, to the State, and the State was to issue $1,500,000 currency bonds, which were to be given to the bondholders in payment of their back coupons. So they paid the cash over to the State, and awaited with impatience for these currency bonds. Two months afterwards they learned, however, to use their own somewhat comic phrase in the report which lies before us, "with feelings of which deep disappointment formed a part" (what was the composition of the remainder they do not mention), that the Governor, or Head Baron, had postponed the payment to the Bankruptcy Court, and that he was using the new bonds in payment of the floating debt of the State, and that the State Treasurer did not see much use in paying the back coupons, as the State would "have to default again in sixty days." Accordingly, it did promptly default in the following July, and the Governor applied to the United States Circuit Court to have new receivers appointed, and new receivers were appointed accordingly. We have said that the old ones had "extensive borrowing powers." Under their management the road earned exactly twenty-five per cent. of its working expenses, and they borrowed as hard as they could to meet the deficiency, and borrowed harder than ever after

the application had been made to the Court to remove them, so that they managed to contract a "floating debt" of $1,200,000. The two new receivers, however, in some unaccountable manner, made the road pay its expenses and something more in the first two months of their administration.

The suit in which these receivers were appointed ended in another order of sale, in which the rights of the first-mortgage bondholders were protected as against everything but the receiver's loans, and the validity of these was ordered to be proved. A man named Balch, about whom the bondholders could learn nothing, then turned up as purchaser, and the Court directed the road to be delivered to him on certain conditions, of which the first was the deposit of $200,000 in cash; but as soon as he found he could have his purchase he disappeared, and after the appointment of another set of receivers, and another sale, the first-mortgage bondholders finally bought the road, and are now in possession; that is to say, after two or three years of litigation and worry, during which they have lost the interest on their money and have been cheated by the State, they are put in possession of an uncompleted and ill-equipped road, have lost the guarantee of the State, and are left to bring their property up to the paying point as well as they can under the savage eye of the Honest Farmer, who will probably be legislating against them a year or two hence as foreign extortioners and speculators, and egging on the State Attorney-General to sue them, and the Governor to call out the militia against them, and "bring them under the dominion of the law." It must be admitted that this sort of performance does not do much for the national credit, and does still less for the national morals. A sovereign State playing the part of a common Jeremy Diddler, by using money for one purpose which was paid to it for another, and converting its own bonds into an instrument of fraud, is one of those spectacles in which there is a lesson; but it is certainly not an improving one.

## A WHITEBAIT RETROSPECT.

London, August 14, 1875.

AMONG the customs which the earnest Administration presided over by Mr. Gladstone allowed to fall into desuetude, and which the easy-going Administration presided over by Mr. Disraeli has revived, may be mentioned the ministerial Whitebait dinner at Greenwich on the Thames. Of what particular ceremonial this indigestible banquet is the survival, I do not pretend to say. It is an idiosyncrasy or fancy of the governing classes in this country. What it comes to is this: In the hot August days, at the end of an exhausting period of work, some thirty or forty middle-aged and elderly English gentlemen, each with his own comfortable house in London and his three or four luxurious clubs, go aboard a dirty river steamboat and steam down through the least savory part of the river Thames to an inferior eating-house overlooking the mud and refuse of London, and there surfeit themselves on curiously-dressed sea-fish and indifferent wine. This was the old annual prelude to the close of the session before Mr. Gladstone became Prime Minister, and this is the revival which Mr. Disraeli—a man who looks as if he should not tamper with his constitution—has thought it due to a Conservative reaction to bring out. Last Wednesday the Ministers went down to Greenwich, and all the more important among them—both peers and commoners—were present. This time last year, you may remember, there was a good deal of talk in the newspapers about the Whitebait dinner. Mr. Disraeli retired to the seclusion of his villa in Buckinghamshire while his Ministers had their fish feast, and the Marquis of Salisbury, who was then brooding over the insults heaped on him by his chief in a moment of extreme elation, was pointedly announced in the fashionable prints to have gone to Hatfield. The gossipmongers, who are clever at detecting the signs of the times, saw in these defections from the dinner a split in the Cabinet. But nothing came of it. Terror of dyspepsia had probably more to do with their defection than any other emotion. This year they were both in their places. Philosophers say that pity is the true foundation of the feelings of affection, and it may be that pity for Mr. Disraeli's misfortunes during the past session has knit together the hearts of his Cabinet. How that may be, I cannot say, but there was no appearance of estrangement, and they sat down to their banquet as if they liked it, and rather enjoyed each other's society.

It may not be uninteresting to speculate what these eminent persons talked about at this the supreme effort of the session. They are at present, it must be remembered, the most important people in England—the people who are keeping the consciences and guiding the destinies of the country, and to whom their country looks in time of trouble. It is not, indeed, difficult to imagine one class of topics which might engross the attention of these the custodians of the good name of England at the present moment, and it is not a pleasant class; and first let us suppose that they turned their attention on themselves, and dwelt during the first five or six courses of the fish upon their own shortcomings. Starting with a brilliant programme of proposed social and sanitary legislation in the month of February, they have arrived at the conclusion of the session without having passed a single measure of anything like first-rate importance. There is probably not a human being, except the new inspectors to be appointed at considerable salaries to stop unseaworthy ships, who will be either better or worse, happier or unhappier, healthier or unhealthier, for the legislation of the session. If the session had been a blank in reality as it must be in history, the English world would have suffered nothing, as, by the weary work of the session, it has gained nothing. The Prime Minister has damaged his reputation as a statesman. Sir Charles Adderley has proved his incompetency for any public position except that of a peer of the realm. Mr. Ward Hunt has shown that a large physical frame does not always contain a generous disposition and a magnanimous character. The other Ministers have given evidence of an activity in their several departments, sometimes but not always well directed, and not one of them has shown any capacity for filling the place of leader of the House of Commons, which must ere long be vacant. Their supporters, or rather their nominal supporters, are still in a considerable majority in the House, and some of the old party discipline remains. But want of confidence in a leader very soon produces faulty discipline in his followers. Early in the session there were indications of unruliness among the men who sit below the Ministerial gangway, and before the end of it there was as much hostile criticism from the Ministerial side of the House as from the Opposition. Outside the House of Commons, from one end of England to the other, there came up unpleasant but not uncertain sounds. Meetings have been held in many places to protest against the inefficient conduct of affairs, and resolutions condemnatory of the Ministry have been freely carried. The sacrifice of the interests of the sailors, who are dear to the people, in favor of tenant-farmers, who are not regarded with sentimental feelings, has taken possession of the popular imagination. Mr. Plimsoll is for the moment the god of the popular idolatry. He has extinguished Dr. Kenealy even in the affections of the lowest of "the residuum," and he has inflicted a serious and lasting blow upon the character of the government of Mr. Disraeli.

And now let us suppose a turn in the conversation from politics to commerce, and the Chancellor of the Exchequer may be imagined to have introduced the topic of the Foreign Loans Committee, which he first opposed, and then reluctantly, under the pressure of his supporters, sanctioned. The frauds which have been exposed by this Committee were not perpetrated during the past session, it is true, but the public have learned during the session that in the heart of this virtuous England, and mainly in the city of London, swindling transactions on the largest scale are carried out by the agency of the Stock Exchange not only with impunity, but almost without discredit. English firms and English Members of Parliament have been found to sell their good names without any hesitation to foreign adventurers and swindlers. They have accepted bribes from needy blacklegs, and helped them to impose upon and rob their fellow-countrymen and countrywomen, and these firms are still regarded with consideration, and these Members of Parliament still sit in the House of Commons and take part in the deliberations for the welfare of the country.

And turning from commercial to social backslidings, what pictures of English life have been exhibited this season! Gambling on a great scale goes on, we are told, in many of the best clubs in London and in private houses tenanted by leaders of the aristocracy and of the fashionable world, and along with rumors of gambling come uglier rumors of unfair play, oozing up from time to time like the bubbles of a polluted fountain. One officer of the army, the scion of a noble house, was cashiered a few months ago for not doubtful dealings in a public room at Cannes. Another officer, late of the Guards, was driven to make a vain attempt to establish his character in a court of law against a charge of unfair play in a railway carriage. An official holding one of the most coveted offices in London had to resign his office and disappear, on account of an accusation of something more than strange dexterity at whist in one of the most select clubs in London—an accusation tendered by some of the most leading men in

England ; and ladies, even, have not escaped the ugly contagion both of fair and unfair play. But over this dark part of this imaginary Ministerial conversation let us trust that the President of the Council would call upon his colleagues to draw a veil. Mr. Hardy, however, the Minister for War, we may suppose, could hardly divert the conversation from the scandal caused the other day by the outrageous conduct of a distinguished cavalry officer—a scandal which shows that it would be hazardous indeed to scratch too deep below the surface of our boasted civilization, and also, perhaps, that the precautions taken by prudent mothers to protect their daughters from too much contact with the world are not unreasonable. Of course the Minister of War cannot be held responsible for the brutalities perpetrated by any officer in the army. But this startling incident in the military life of modern England is one that could not fail to be mentioned in the retrospect which I have endeavored to imagine. Neither must I omit from this unpleasant catalogue the latest incident of crime—the fraud and flight of Alexander Collie. We have no Minister of Finance in England. The nearest approach to such an officer, being the President of the Board of Trade, is Sir Charles Adderley. I do not know whether he is responsible for the framing of the following advertisement, which appeared in the second column of the *Times* on Tuesday last, but, if he is, it is the most creditable thing he has done this session :

"One Thousand Pounds Reward.—Absconded, by not surrendering to his bail on the 9th of August instant, and recharged on a warrant issued on that day with conspiracy to defraud the London and Westminster Bank, by false pretences, Alexander Collie, late of 17 Leadenhall Street, London ; Aytoun Street, Manchester ; No. 12 Kensington Palace Gardens, and Dover House, Roehampton, in the County of Surrey, Merchant and Commission Agent. Description : Age fifty-two years, height six feet, hair reddish-brown (turning grey, cut short), whiskers reddish, and complexion florid ; high cheek-bones, eyes small ; has a deep scar on upper lip extending towards the cheek ; dresses well in dark clothes, tall hat, walks erect, square shoulders, rather thin build ; a native of Scotland. The above reward of £1,000 will be paid for the reapprehension, or such information as shall lead to the reapprehension, of the said Alexander Collie. Information to be given to Inspector Bailey, City of London Police, Detective Department, 26 Old Jewry, E. C.—9th August, 1875."

Alexander Collie, the subject of this advertisement, laid the foundations of his colossal dealings, as I understand, in a series of more or less successful ventures in blockade-running during your great war. Since then, like so many men of humble origin and imperfect education who have battened on commercial speculations, he has lived a life of vulgar ostentation, struggling like the frog in the fable to expand his petty existence to the dimensions of those who were to the manner born. Like his prototype, he has gone off with an ugly explosion, ending not unfitly, as an outlaw from his country, a speculative career which commenced under such sinister auspices. He is the last of the British blockade-runners. They have all gone to a bad commercial end, and he has gone to more utter ruin than any of the others.

But now we may imagine the Ministerial banquet drawing to its end. The large embossed basin filled with rose-water—an unvarying feature of a Greenwich dinner—is being handed round, and such guests as may wish to dip their napkins in diluted hair-oil have an opportunity of doing so. The Prime Minister of England rises to move the adjournment to the Terrace, and, after congratulating his colleagues on their successful session and their agreeable conversation during the evening, he modestly announces that, politically, commercially, and socially, England never was sounder than at the present moment, under the present Prime Minister and his Government, and he cheerfully calls upon the members of his Cabinet to join him in singing "nunc dimittis."

## THE GEOGRAPHICAL CONGRESS AT PARIS.

Paris, August 11, 1875.

THE evening papers of to-day in New York should contain a telegram announcing that in the distribution of awards this afternoon by the Geographical Congress some six or eight of the first honors, in letters of distinction and in gold medals, were accorded to institutions and citizens of the United States. At least, I presume to hope that the telegraphic bureau has deemed such national honors worthy of immediate publicity, and that for many Americans they will have a higher significance than prizes won in a boat-race or a rifle-match ; though I have no idea that prominent merchants, bankers, and editors of New York will subscribe for a dinner complimentary to the successful contestants in this high arena of science, nor that politicians will devise a procession in their honor. But, whatever satisfaction and pride you at home may extract from the compliment paid by the jury of the Congress to American science and skill, the two or three deputies who sat as members of the Congress for the United States found every day some fresh cause for humiliation at the meagre figure which their country presented at this general court of the scientific world.

More than a year ago, the Geographical Society of Paris, pursuant to the action of the first Congress, held at Antwerp in 1871, decided to convoke at Paris a second International Congress, representing geography and its affiliated sciences, and appointed a bureau, of which the Vice-Admiral Baron de la Roncière-le-Noury was president, to make the necessary arrangements. In issuing the call, the term "geography" was used in the broadest sense, to include geodesy, hydrography, meteorology, botany, zoölogy, anthropology, ethnography, philology, topography, cartography, statistics, explorations, and discoveries ; and arrangements were made for an exposition of books, maps, instruments, and materials used in and derived from the service of geography in all these subdivisions ; in a word, here was a platform upon which men of science, travel, and research, from all parts of the world, could come together, share each other's knowledge, and plan for further conquests in the common domain of man and his abode. In this enterprise the Geographical Society of Paris was warmly seconded by the Government of France, and invitations were issued in a liberal spirit to the governments and the learned bodies of foreign countries to participate in the Congress and contribute to the Exposition. The Government of the United States declined to do anything in the matter, either by an appropriation of money and materials or by the designation of commissioners. The American Geographical Society appointed a small delegation to represent it in the Congress, and, by dint of much entreaty, at the very last moment the Government consented to recognize certain of the Society's appointees as commissioners, in order to give them a status, on the express condition that they should in no wise represent the Government, nor incur any liabilities upon its account. Restricted in this manner, an American physician of Paris, and Prof. Nourse of Washington, with one or two other deputies of the American Geographical Society, represented as best they could the scientific work of America at their personal cost and trouble. And what was the consequence ? An entire wing of the Tuileries was filled with the apparatus and the results of geographical science—each nation having a section of its own, in which its geographical work was set up for inspection and for comparison with others. It was a superb collection, truly a marvellous display, and fitted to impress one profoundly with the nurture that different peoples have given to science, and the fruits with which that nurture has rewarded them. This long series of halls was one continuous lecture upon comparative civilization. Well, after wandering through them for hours, studying the catalogue, and questioning the guides, the American might stumble at last upon the place to which his country had consigned herself in this competitive Exposition—a room eight feet by twelve, in an obscure corner of the building, containing the charts of the Coast Survey, Gen. Myer's weather charts, Gen. Walker's Statistical Atlas, the United States Census, Col. Hayden's reports, a few volumes of statistics, and a few photographs of public buildings ! It was no fault of the committee that the United States were shoved into this insignificant corner ; they gave us all the room we needed, and as good as we deserved ; and, as above stated, each and every form of scientific labor represented in that tiny collection received some token of approbation from the jury. It was our own fault that we had so little to exhibit, and nobody to explain what was there.

Then, in the Congress itself, our status was still more unpronounced—in fact, it was just nothing at all. More than fifteen hundred members of the Congress were enrolled. These were divided into seven sections for the discussion of classified questions, and every afternoon the whole body met to hear reports of the morning's work of the sections. Having given in my credentials and joined a section, I set out upon a tour of observation to find my colleagues, whose names I knew only from a chance paragraph in the New York *Herald*. For three days I searched in vain for an American face or name, and many a question and joke did I have to parry as to the paucity of our representation and the insignificance of our collection, until I had the comfort of stumbling upon a brother delegate, and finding that he had been suffering the same disappointment and mortification. At length we were able to count up in all some four or five American names in the fifteen hundred of the Congress. The whole deputation could have been shut up with the American collection in the aforementioned room of eight feet by twelve.

The French committee, with admirable fairness, had arranged to have the several nations represented in the central bureau and the vice-presidencies, and on the opening day there were speeches from Germany, England, Russia, Holland, Italy, Hungary, Belgium, Switzerland, Egypt ; but,

through our defect of representation, the name of the United States was not so much as mentioned. On each succeeding day the presiding officer was chosen from the different nationalities in turn, but on no occasion did this distinction fall to the lot of an American. In the several sections the chairmen were chosen daily from different nationalities, but no member from the United States was ever called to fill the chair of a group. Most important discussions were had in the sections, and abstracts of these will be given in the official report ; but, alas ! how little can be credited to members from the United States. By its own indifference it came justly to pass that from beginning to end our country was counted out. The American delegates were far too few to assert themselves, and those who appeared had not been chosen altogether upon scientific grounds, but from considerations of convenience and to fill up chinks ; they were zealous in doing their part ; but when they entered the Congress they found America was *all* a chink, and so had to go under. That is the case as it was.

In contrast with our actual appearance at Paris, it is easy to see what might have been done, and ought to have been done, on such an opportunity. (1) The Government of the United States, having contributed so much to the advancement of science by explorations in the South Seas and in the Arctic Ocean, in South America, Central America, and in Palestine, by surveys in the interior and along the coast of its own territory, by deep-sea searchings and astronomical observations, might have sent a complete set of its own publications in charge of a person competent to exhibit them. Whatever the theory of the functions of government, no one would have thought of complaining if the Government had made a full exhibit of its own scientific work to a Congress of the scientific world. If it is not competent to do that, why should it have ever encouraged science at all ? Instead of this, the Government, or some official, sent three paltry boxes, and left a private gentleman in Paris to pay all the expense of having their contents suitably displayed.

(2) If the Government at Washington could not directly make appropriations toward such an exhibition, the Secretary of State should at once have given publicity to the invitation to the Congress, and with his moral sanction have commended it to the governments and the scientific bodies of the several States. In that case, several States might have been represented by a full report of their geological and topographical surveys and their industrial resources, and thus there would have been a proximate representation of what the United States are, and have accomplished, in a geographical point of view.

(3) The merchants and bankers of New York should have placed at the disposal of the American Geographical Society a fund of ten thousand dollars, by means of which the Society could have furnished a "round ticket" for the trip to Paris to twenty gentlemen, selected impartially from the whole country, as the foremost representatives of science. Such gentlemen are not apt to have means to spare for so long a journey in the public interest ; and the Geographical Society, while most earnest for the success of the Congress, had no funds for such a commission. Twenty men of repute in science, or even ten, with the proper auxiliaries of books, charts, and instruments, would have placed the United States upon an equality with any nation in the Congress in branches of science where we have no reason to fear competition. The honor we did achieve in the Exposition by even our scanty showing would have been increased tenfold by the presence of such men in the Congress itself. As it was, we seemed to be distanced not only by France, Germany, and England, but by Russia, Switzerland, and Belgium. It is more than a pity, it is a shame, that so rare an opportunity for exhibiting the better side of our nation has been heedlessly thrown away. At a time, too, when we are courting Europe for our Centennial Exposition, we had need to show a spirit of international courtesy. Many Frenchmen and Germans have said to me here, "How can you expect us to go over to your Exposition next year if you care so little for this ?"

## THE UNIVERSITY OF JENA.

To the Editor of The Nation :

Sir : The last number of the *Independent* contains the following paragraph :

"Mr. J. M. Hart, in his volume on 'German Universities,' has this sentence : 'Jena is, I believe, the only university in Germany which degrades itself by selling its degrees to foreign applicants.' The passage has just been brought to the notice of the Jena professors, who are much disturbed by it, since the statement, though doubtless made in good faith, is totally unfounded. We have received direct and reliable information from Jena, which satisfies us that Mr. Hart has done a great injustice to one of the best of the German universities. . . . We need only mention the names of Schrader, Grimm, Hilgenfeld, Haeckel, Schmidt, etc., to show the intrinsic falsehood of Mr. Hart's statement."

The wording of the above is such as to excite some wonderment. The readers of a semi-religious paper like the *Independent* may reasonably look for more skill in casuistry. If an author's statements are "doubtless made in good faith," it is scarcely logical to brand them with "intrinsic falsehood" ; if they are intrinsically false, it is mere euphemism to make good faith the empty compliment before the blow.

But it would be wasting time to quarrel longer over words, so long as the facts are against me. I have been assured by private information from Germany—doubtless the same information that crept into the *Independent* —that my charge against Jena is unfounded. The information is of the highest order, and not to be suspected for a moment. I hasten, therefore, to remedy the injustice, so far as that is now possible, by publicly withdrawing herewith the charge, and promising to correct it in future editions of the 'German Universities.' I must add—and herein you, Mr. Editor, will bear me witness—that this retraction had been promised by me a fortnight ago, voluntarily, and before I had reason to suspect that the *Independent* was possessed of any information on the subject.

Suffer me to clear my skirts a little more. The present faculty of Jena assert explicitly that they do not sell diplomas. I accept their declaration and admit that my words of last year, so far as they have any present bearing, are wrong and unjust. But the case was not always thus. For many years, even down to my own student-days, the Jena faculty did sell diplomas. A Jena graduate, now residing in Philadelphia, wrote to me some months ago as follows :

"I received the diploma of M D. in 1864. During the time I was there I learned that up to 1860 the old faculty did sell diplomas of Ph.D. to foreign applicants without examination, but this pernicious practice was entirely broken up by the Government retiring the old faculty and forming a new one. Prof. Schulz, the dean of the medical faculty, told me at the time how the old faculty had degraded the institution, but that the new one had eradicated the blot upon its escutcheon by their strict obedience to the regular forms of the other universities," etc.

It will appear from this that my words in the 'German Universities' had at least some foundation. The mistake that I made is one that is liable to occur in every book of an autobiographical character ; the writer is always in danger of confounding his recollections with the changed facts of the present. My charges against Jena were based upon the local tradition current at Göttingen from 1860 to 1864.

It is scarcely necessary to dwell upon the deep regret which I feel both for myself and for the Jena professors whose susceptibilities have been wounded. May they accept this apology in the spirit in which it is offered, with the assurance that it has given me sincere pleasure to learn of the changed state of affairs. Something surely can be overlooked in a work the whole animus of which is admiration and friendship for the German universities. Perhaps this public adjustment of the grievance may, after all, be productive of good by vindicating the dignity of Jena more fully than ever before.—Yours very respectfully, J. M. Hart.

August 16, 1875.

## "THE ELEMENTS OF ENGLISH PRONUNCIATION."

To the Editor of The Nation :

Sir : In your recent review of Professor Whitney's Essays you say he "describes the vowel sound of *they* as a slide beginning with *e* in *let* and ending in *i* in *pin*. He gives the same sound in *fate, fail, great, they*. We make this slide in *they* uttered alone, but make no *i*-vanish in *fate, fail, great*, or in *they* prefixed—*they came, they ran*." Are you positive about this ? Careless assertions are not frequent enough in the *Nation* to encourage the assumption that you have not carefully observed your own utterance of these words ; yet I can more easily suppose your ear does not detect all the sounds you utter than believe you pronounce *fate*, for instance, so flatly as you must if you really make no *i*-vanish. I come to this conclusion—(1) because few English-speaking people detect this *i*-vanish in any of our words ; (2) because, since I learned to distinguish this sound myself, I have found it frequently a good shibboleth to detect a foreigner, it appearing about equally difficult for us to omit, and for the Continental student to pronounce, the *i*-vanish ; and (3) because I cannot pronounce this word *fate* with three sounds without modifying the position of the tongue during the utterance of the second, which I surely could do if the latter were a

simple sound. Let us substitute carefully for this *a* the *e* of *let*, or, more exactly, the continental *e*, and there results *fet*, similar to *let* with the *e* prolonged, which is very unsatisfactory, and unlike any pronunciation of *fate* I ever heard from the mouth of an American.

My native dialect should be the same as that of your reviewer, for I am a native of Harvard, Massachusetts, and a graduate of Harvard College. Up to the time of my going abroad after my graduation I had never received any intimation that either *ā*, *ī*, *ō*, or *ū* was a compound sound When, therefore, a teacher of vocal music, in Germany, could not tolerate my pronunciation of the German *e*, which I pronounced like our "long *a*," it was equally impossible for me to understand the nature of the defect in my pronunciation, and for him to explain it. My utmost endeavor to imitate his utterance of this simple sound was futile until my own ear became trained to distinguish in my pronunciation the furtive *i* which I had invariably added.

Two years later I had a French teacher in Paris, who spoke English with the usual defects of a Frenchman. His pronunciation of *fate* was peculiarly painful to me. It sounded exceedingly flat in his mouth, and his efforts to improve it by simply imitating the correctly-pronounced word were unavailing. When, however, I analyzed the word for him, and directed him to pronounce it slowly at first, and in two syllables (fĕ-ĭt, using the *i* of pique, not of *pin* for the vanish), bringing them more and more closely together till they were pronounced as rapidly as possible, then he pronounced *fate* as well as any American. The same method has yielded the same result many times since.

By these observations I became thoroughly convinced that to omit this *i*-vanish in our "long *a*" was conclusive evidence of a mother tongue whose alphabet lacked such a compound, and that to pronounce the Continental *e* with this *i*-vanish added was equally significant of an English or American origin. This conviction has been much strengthened by teaching American students to pronounce German and French. Every class, and as far as I remember every individual, has required considerable persistent training in order to establish the habit of pronouncing the *e* and *o* of the Continental languages without adding the vanish of the corresponding English vowels.

Professor A. Graham Bell, of Boston University, son of the inventor of "visible speech," justly remarks, in an article in *Old and New*, that "when teachers themselves know *what they do* in speaking well, the correction of all peculiarities of utterance will be a matter of little difficulty." At present many of our language teachers, if asked *what they do* when they pronounce *o*, would only be able to reply with Molière's *Bourgeois Gentilhomme*, "Mais, je dis *o*." Is not this ignorance the chief of the lions that seem to stop the road to a reformed spelling? Then come these formidable dialects to be conquered and harmonized. Against such foes Professor Whitney's essays and your review of them are the best of ammunition. These notes from my personal experience are given, not so much from any fear that the wrong view of the letter considered will ultimately prevail, as from a conviction that only by discussions of this character can we develop that phonetic sense which must precede a phonetic orthography.

W. C. Sawyer.

Minneapolis, Minn., July 8, 1875.

---

[There is a warm discussion going on among the masters of phonetics, in England, about this *a* in *say, fate*. Mr. Ellis insists on the sound which he marks *ee*. He "deprecates much" Mr. Bell's insisting on *ei*. But Mr. Bell and Mr. Murray hear the *i*-vanish from Mr. Ellis's own mouth. Very likely our correspondent would hear it from ours. We have had experience with foreigners similar to his. The facts seem to us to be that the French and German *e*, like our *e* in *let*, is made with the organs a little further open than *a* in *late*, and the sound of *i* in *pique* is made with the same organs a little nearer closed than *a* in *late*; so when one is making *e* in *let*, if you tell him to add to it the sound of *i* in *pique*, he will in doing it pass through the sound of *a* in *late*, and will recognize it, and soon learn to hold it. Telling a man to add an *i*-sound to *e*, is in effect directing him to a closer sound; telling him to avoid an *i*-vanish, is practically a direction to make a more open sound. Our correspondent's difficulty in making *fate* with three sounds perhaps arises from the fact that the tongue is raised for the *t*, and so does really with him educe the full *i*-vanish, though it does not with us. Perhaps if he tries *ape* he will find that he can hold his tongue steady and unmoved for *a* while he closes the lips for *p*. The Dutch are having a quite similar dispute over their *e* sound.—Ed. Nation.]

---

## THE NAPOLEON OF THE BANK OF CALIFORNIA.

To the Editor of The Nation:

Sir: I ask permission to correct, through your unbiassed paper, certain comments which have been made during the past few days by a part of the press (the New York *Tribune* among others) on the failure of the Bank of California and its president. They would have seemed utterly heartless to one at least of their readers, if he had not remembered that ignorance of facts is often no hindrance to the most confident assertion of editorial opinion.

The gist of the moralizing was that Napoleons are no more to be desired in the financial than in the political word. I beg leave to say, as one who, from earliest recollection, has been indebted to Mr. Ralston for countless kindnesses; as one who has known his life at home and at business, that so far as the qualities (which all men admire), strength of will, accuracy of judgment, and great power of execution, are concerned, he *was* Napoleonic; but if selfishness is ascribed to him as the governing motive of his conduct, I deny it as untrue. It is true that Mr. Ralston possessed a wonderful farsightedness, a singular rapidity and soundness of judgment and great executive power, and he might well have said of these qualities, as John Stuart Mill said of his early training, that they enabled him to start with an advantage of a quarter of a century over his contemporaries; for he was able both to plan and to execute, while ordinary men were still *thinking* of planning. But it is *not* true that these great powers were employed by him for selfish ends.

It is one thing to accumulate millions in such a manner that honest people, who have the interests of worthy and needy institutions at heart, shall be in constant dread lest these vast sums be ultimately converted into a single tissue-paper bond, and so swallowed by the possessor as a pill on his death-bed. But it is another and far different thing to use one's accumulated wealth in whole-souled devotion to the development of an immature State; in lending aid to industries which, having been at first unsuccessful, nobody else had foresight enough to regard as anything but hopeless failures. It was thus that Mr. Ralston, unaided, rescued from their financial embarrassment the woollen mills and the Kimball carriage and car manufactory—two enterprises which have since won credit for California, and by their success have encouraged manufacturing projects in other directions.

It is one thing, also, to have (as one of Mr. Ralston's associates had) a reputed daily income of $10,000. But it is another thing to prefer, as Mr. Ralston did, to such an income—which, if the other had it, he might himself equally have had—the expenditure of his money in encouraging artists, in aiding charitable institutions, in giving every imaginable pleasure to friends, in sending his own horses and carriages for the use of invalid friends who were travelling in parts of California where the most comfortable conveyances were not to be had, and in extending to strangers a bounteous hospitality not outdone by Nature herself when she welcomed the first strangers to that land.

Some of the newspapers have said that he lived in a luxurious style unprecedented in the history of bank cashiers. True; but it was for others' pleasure, not his own. It was not for *his* use that nearly a dozen varieties of choice wines and every delicacy known to cookery appeared on his table. And when he entertained his guests with music and dancing, and invariably excused himself at ten o'clock to rise again at six, everybody well understood how essential was this regular rest for his unceasing work. Prior to the building of a railroad, and for a short while after its completion, he was accustomed to take recreation in driving daily from his country-place to and from the city (twenty-five miles), changing horses half-way But of late years his increasing work has rarely allowed him to be more than once a week at home, where his horses have still remained in constant service for others' pleasure. This was some small part of his unselfishness and care for others' interests which his late failure would seem to belie, but which, when balanced with his warrantable self-confidence, will not appear diminished. He was a leader because none were so fit to lead as he. He was the Bank of California because the directors were well aware that he was far better able to promote their interests than they themselves, and that they were better fitted to go through the formality of ratifying his acts than to impede his action by questioning his judgment. If this is the stuff Napoleons are made of, surely, sir, you must join me in hoping that the world may have more of them.

A. A. Wheeler.

Cambridge, Mass., August 30, 1875.

# Notes.

A NEW publishing firm, of Joseph H. Coates & Co., has been formed in Philadelphia, Mr. Coates having withdrawn from the firm of Porter & Coates. The two houses are under one roof, and will have intimate business relations.——The *Independent* of Aug. 26 gives a number of Cypriote inscriptions from the remains in the Cesnola Collection, with their Greek and English equivalents furnished by Mr. Isaac H. Hall. Most of them relate to votive offerings.——The *Athenæum* states that the publication of the second volume of Corssen's work on the Etruscan language will not be delayed by the death of the lamented author. It was, in fact, already in print, needing only revision and an index. He leaves an unfinished work in MS., 'Beiträge zur italischen Sprachkunde,' which will also shortly appear.——The second *Abtheilung* of the second volume of Marquardt and Mommsen's 'Römische Alterthümer' has been issued. No less than 360 pages are devoted to the *Princeps*, or Emperor, his subordinates and administration. If this is not an entirely new field, we are not aware that it has ever before been thoroughly or systematically worked; certainly not in the light of the new scholarship. It has a very great importance as connecting the republican institutions, with which we are pretty familiar, with those of modern times.——*Nature*, July 29, in an article on the regulation of rivers, apropos of the recent disastrous floods in Europe, recalls a paper, pretty much forgotten in this country, by the late Charles Ellett, jr., on the "Physical Geography of the Mississippi Valley, with suggestions for the improvement of the navigation of the Ohio and other rivers." It appeared in the 'Smithsonian Contributions to Knowledge' for 1851, and would seem to be worth reviving. Mr. Ellett proposed a system of reservoirs for the purpose both of keeping a uniform depth of water on the shoals and bars, and of taking off the excess of freshets.

—*Lippincott's Magazine* for September contains a sprightly paper, by Mrs. Sarah B. Wister, entitled "A Rococo Love-Story," for which the recently-published correspondence of the Chevalier de Boufflers and Mme. de Sabran furnished the material. If that beauty's portrait could have been added from the same source, the readers of the magazine would have had still greater reason to be thankful. Mrs. Lynn Linton begins a new serial, "The Atonement of Leam Dundas." "Our Architectural Future," by Edward C. Bruce, is written with more than the usual intelligence of writers who approach this theme, and still seems to fail of conveying his own ideas with distinctness. He is misled and confused, as other less cultivated men are constantly, by the assumed necessity of giving or finding a name for every architectural design. Thus he is an advocate of what he calls the Romanesque, and an opponent of the so-called Gothic style; and yet he says that the eclecticism which assumes the latter name in this country has generally at the root of it "the idea of fitness, convenience, and adaptedness to practical purpose." Now what difference does it make whether the architect who is governed by this idea, which, we need not say, is the capital stock of the genuine builder, does or does not consider his design "pure Gothic," or is or is not aware that he is on the road to the "Romanesque"? And what praise or blame is it to point out to him "Greek lines and forms permeating" his construction, and "abundant souvenirs of Vitruvius"? The laws of proportion and the necessary directions of straight lines will of course produce resemblances in the architecture of nations the most distant from one another; but the school which works out its designs from use and fitness knows that it is only taking its own and not another's property. And let it be, as Mr. Bruce would have it, that our American sun and sky will sooner or later bring us to the building for which the Levant furnishes the model; the result, if it is a rational one, may be reached by the unconscious efforts of architects who have learned the lessons (for all countries and all times) of honest construction only from the Gothic monuments of Belgium and northern France. "Our people have at bottom a juster and sounder sense of the beautiful than the northern races of Europe. They show it in the superior elegance of their public parks, vehicles, and vessels, and will increasingly evince it on the broader and finer field of architecture." They will do so only when they can be made to understand that the same principles underlie the building of a cathedral as of a "clipper" or a "buggy," and to pay as little regard to the name of the style in the one case as in the other.

— Mr. William Page contributes to the last *Scribner's* a very elaborate argument to prove that the German death-mask of Shakspere (which he is using as the basis for his ideal portrait of the poet) is authentic, and in fact the most authentic likeness in existence. He admits that the evidence for the pedigree of the mask is wanting, but maintains on internal grounds that the case can be made out. There is no doubt that he is absolutely convinced of the correctness of his conclusions, and, if his article had been thrown into a somewhat colder and more logical form, there can be no doubt either that it would by itself, and in the absence of contrary arguments, produce a very weighty impression. The evidence is of a kind, however, that it would require a jury of experts to weigh properly, with a strong probability that they would, like most æsthetic experts, fail to agree from having made up their minds beforehand *pro* or *con*. There is, too, something about the subject of Shakspere so fascinating to the imagination of anybody who begins the study of it that there is no saying how long he will be able to keep his feet on the solid ground of fact, without wandering off into speculations which have not a shadow of foundation. We know of at least one investigator who, without having yet been locked up in a lunatic asylum, brings out every few years a new edition of a work proving Shakspere to have been none other than Lord Bacon, and this author has himself merely followed out logically the ingenious footsteps of those who discovered before him that Shakspere was the real discoverer of the circulation of the blood—to cite one of a dozen examples. The recollection of Judge Holmes's wonderful excursus makes us somewhat chary of believing at once any startling addition to Shaksperian learning; but we must admit that Mr. Page's investigations are very interesting, and that his head, or rather the photograph he has reproduced from the mask, is a fine and noble one. He assumes, if we correctly understand him, the Droeshout print, the Chandos portrait, and the Stratford bust as all being more or less faithful representations of Shakspere, and then, by measurements and comparisons of peculiar marks, shows that the mask is the most Shaksperian of all. Of twenty-six measurements of the mask, as for example of the distance between the eyebrows, between the inner corners of the eyes and the outer corners of the eyes (Mr. Page gives the measures themselves in the article), "at least ten or twelve fit exactly corresponding points of the Stratford bust," and "few persons need be told that this planet never did, at any one moment, contain two adult heads whose faces agreed in any dozen like measures, and the law of probabilities makes it remote when such an epoch will arrive. To a working artist's mind, the agreement of these measures is either a miracle or demonstration that they are from the same face."

—The several thousand or hundred thousand persons, young and old, of both sexes, in the United States who were amusing themselves a short time ago with contests in spelling, will be interested in an article in the *Atlantic* called "A Patriotic Schoolmaster," by Mr. Horace E. Scudder. The patriotic schoolmaster in question was no other than Webster, of 'Webster's Unabridged,' and the facts with regard to him which Mr. Scudder recalls throw a curious light on our educational past. Dr. Webster belonged to the generation immediately succeeding that of "the founders," and he was by nature an educator. He was also, like all others of his time, an ardent patriot, and he seems to have been one of that body of misguided men who first set this country thinking about the possibility of producing not only an American government, but American morals, American political economy, American art, American letters, and even an American language. At first he began moderately with a Reader, the title-page of which contained this direction for the guidance of parents and teachers, taken from Mirabeau: "Begin with the infant in his cradle; let the first word he lisps be 'Washington,'" and in the preface to which the editor says:

"In the choice of pieces, I have been attentive to the political interests of America. I consider it as a capital fault in all our schools, that the books generally used contain subjects wholly uninteresting to our youth; while the writings that marked the Revolution, which are perhaps not inferior to the orations of Cicero and Demosthenes, and which are calculated to impress interesting truths upon young minds, lie neglected and forgotten. Several of those masterly addresses of Congress, written at the commencement of the late Revolution, contain such noble sentiments of liberty and patriotism that I cannot help wishing to transfuse them into the breasts of the rising generation."

But as he went on he became more and more advanced in his views, insisting, in an essay on the Manners, Government, and Debt of the United States, that "a fundamental mistake of the Americans has been that they considered the Revolution as completed when it was but just begun," and adding significantly, "This country is independent in government, but totally dependent in manners, which are the basis of government." In morals, fashions, and modes of speech, he discovered a slavish subserviency to Europe. Patriotism gradually getting the better of Dr. Webster, his interest in the reform of language, which was indeed genuine, became curiously confounded with political interests, until, in an essay on the necessity, advantages, and practicability of reforming the mode of spelling

and of rendering the orthography of words correspondent to their pronunciation, we find the following extraordinary passage :

"A capital advantage of this reform," he says, "in these States would be, that it would make a difference between the English orthography and the American. This will startle those who have not attended to the subject ; but I am confident that such an event is an object of vast political consequence. For the alteration, however small, would encourage the publication of books in our own country. It would render it in some measure necessary that all books should be printed in America. The English would never copy our orthography for their own use ; and consequently the same impressions of books would not answer for both countries. The inhabitants of the present generation would read the English impressions ; but posterity, being taught a different spelling, would prefer the American orthography. Besides this, a *national language* is a bond of *national union*. Every engine should be employed to render the people of this country *national ;* to call their attachments home to their own country ; and to inspire them with the pride of national character. . . . Let us then seize the present moment, and establish a *national language* as well as a national government. Let us remember that there is a certain respect due to the opinions of other nations. As an independent people, our reputation abroad demands that in all things we should be federal, be *national*, for if we do not respect *ourselves* we may be assured that *other nations* will not respect us. In short, let it be impressed upon the mind of every American that to neglect the means of commanding respect abroad is treason against the character and dignity of a brave, independent people."

—Some of the changes in spelling introduced by this patriotic enthusiast have, as Mr. Scudder says, been adopted in this country, if not in England, and there are probably few educated Americans who still write *honour*, *labour*, or *cheque*, though down to within a few years we remember *publick* and *critick* to have been preserved by Virginia purists. On the other hand, some of his most cherished reforms, as indicated in the following sample of reformed English—

"The reeder wil obzerv," he says, "that the orthography of the volum iz not uniform. The reezon iz that many of the essays hav been published before, in the common orthography, and it would hav been a laborious task to copy the whole for the sake of changing the spelling. In the essays ritten within the last yeer, a considerable change of spelling iz introduced by way of experiment"—

have not been adopted altogether into the vernacular. In connection with this article, the reader will find another on the "Spelling of the Future" in the current number of the *Galaxy*, by Mr. Richard Grant White, in which he considers the subject apropos of the appointment of a committee by the American Philological Association on phonetic reform, which Mr. White considers neither necessary nor desirable nor possible. If what is contemplated by the reformers is a general revolution in the English spelling, they may find in the reformatory efforts of Dr. Webster some food for reflection, there being always one great obstacle in the way, which is sure to make any change slow and to prevent any violent *saltus*—we mean the absence of any final authority on the subject. When we remember that we have not even an Academy, and are accustomed, too, on most occasions, to thank heaven that we have not, it must be obvious that the amount of resistance to any change proposed *ex cathedrâ* is simply incalculable, for it amounts to the whole force of custom in a population very tenacious of custom, while the force the innovation has behind it is the convenience, not of the generation now on the stage, but of those to come. That changes will always be taking place in the English language Mr. White does not deny ; but he insists that they will be in the future, as they have been in the past, gradual, and not introduced on the gigantic scale contemplated by Dr. Webster, whose reforms, as Mr. Scudder points out, have been successfully, though unconsciously, parodied by Mr. Josh Billings.

—In *Harper's Monthly* Mr. S. G. W. Benjamin follows in the footsteps of Mr. S. A. Drake, and treats pleasantly of one of the "nooks of the New England coast" neglected by the latter—namely, Gloucester and Cape Ann. Of the other illustrated papers two happen to relate to the tournament, Porte Crayon's describing the sham article at the South—wholly sham it would be except for the good horsemanship—and Mr. Edward Howland's the tournament of the Middle Ages. Mr. M. D. Conway begins a series of papers on the South Kensington Museum which promise to give untravelled readers a more definite notion than they have ever had of the scope of this wonderful institution. A ground plan, numerous views of exterior and interior, and of special objects, and portraits of the director, Mr. Cunliffe Owen, and of Sir Henry Cole, who may be called the creator as distinguished from the founder of the museum, adorn Mr. Conway's always interesting text. Mr. Parton arrives in his progress at recent English caricature, and gives numerous specimens of it from Cruikshank to Matt Morgan. The Centennial paper of the present number is by Prof. W. G. Sumner, and relates to the monetary development of the Republic. It is a succinct chronological record of the financial measures, shifts, and disasters of the country from its first settlement (but more minutely from 1775) to the present day. The works necessary to consult for the desired information are for the most part (Mr. Sumner's own work is omitted) mentioned in the foot-notes, thus greatly enhancing the value of the paper for reference. The inflationist who reads it will have to confess that the "monetary development of the Republic" is not exactly the phase of our national growth on which we shall be urgently desirous to have foreigners fix their attention at the coming Exposition. We commend to him, whatever be the nature of his pet scheme for making something out of nothing, the following extract, the only one for which we can find room :

"The great fire of December, 1835, at New York led some to propose a bank of $5,000,000 for the sufferers. Niles said, 'To make a bank is the grand panacea for every ill that can befall the people of the United States, and yet it adds not one cent to the capital of the community.'"

—Mr. John Hogg, the London publisher, sends us a printed "Caution to Publishers," being a summary account of the copyright case of Van Voorst *v.* Hogg. The circumstances were curious. The plaintiff is the proprietor of a work which appeared in 1837, called 'Yarrell's British Birds.' The defendant issued last fall a holiday-book of animals for children, under the title of the 'Parlor Menagerie,' and was greatly surprised on being presently accused by Mr. Van Voorst's solicitor of having been guilty of "piracy" in the use of fifty-one woodcuts, which, it was alleged, had been copied from illustrations in Yarrell's work. All these cuts, however, had already been published by Mr. Hogg in 'Our Feathered Families' as long ago as 1862–63 ; and what is more, they formed part of a lot of woodcuts purchased by Mr. Hogg's father in 1859 from the stock of a deceased Newcastle printer and publisher—67 of them being from the hand of Thomas Bewick, and 94 by two of his pupils. It is very clear that "piracy" is not the word to express Mr. Hogg's innocent part in the matter, even before one examines the question of the originality of the blocks themselves. The case being pressed, however, a laborious examination and comparison of the cuts was begun before the Master of the Rolls, but before it was half over a compromise was proposed by the plaintiff's counsel, and was accepted by Mr. Hogg, apparently to save expense. Each party paying its own costs, the latter agreed to omit the cuts in controversy from future editions of the 'Parlor Menagerie,' and to deposit the blocks in the Court of Chancery until the expiration of the copyright of 'Yarrell's British Birds,' which will take place in two or three years. It appeared in evidence that Yarrell had copied some of his birds (not among the fifty-one) "line for line, and feather for feather, from originals existing prior to 1837" ; that like most popular delineators of birds who have succeeded Bewick, he was indebted to this master for the best of his illustrations ; that the alleged copies had mainly superficial resemblances, such as naturally arise in copying from stuffed specimens or from characteristic attitudes of the living birds ; that the engraving of them was of an earlier school than Yarrell's ; and that the surroundings of the figures were entirely different in the two cases. The Master of the Rolls was satisfied that "the 'Parlor Menagerie' could in no way injure the plaintiff's book," and that "what he was asked to administer was 'extreme law.'" The legal questions opened up, however, were very peculiar, and he could only say that "every copyright case must be decided on its own special circumstances" ; and this being so, Mr. Hogg very properly cautions his colleagues in the book-trade against buying woodcuts without guarantee. He even found unavailing the plea that copying from woodcuts in a book was legal at the time when Bewick's pupil (Rieveley) did what copying from Yarrell could be proved.

—We find in the *North China Herald* (Shanghae, June 12) a review of the thirteenth annual report of the Peking Hospital by the physician-in-charge, Dr. Dudgeon. This gentleman appears to be a very effective missionary in his way, owing to his professional skill, his fluent command of the Chinese language, and his access to all classes of citizens in consequence of his honorary connection with the British Legation. From the highest to the lowest, he is in the habit of receiving kind looks, courtesy, and respect, and more substantial tokens of gratitude for his services rendered to individual patients. Fine pieces of silk, boxes of tea, jars of wine, cakes, fruit, scrolls, and money for his daughters are enumerated among his presents in the report.

"One reigning prince, the descendant of the celebrated Prince of the Tourgouth Tartars, sent 100 catties of rice, and on another occasion (and this last is by no means uncommon) a Chinese dinner, served up in innumerable little dishes. The same prince is preparing a handsome wooden

tablet for erection in the hospital. He has been cured of opium-smoking, and the thousand ills that sometimes follow in its train."

This cure is something of a specialty with Dr. Dudgeon. Adjoining the hospital is a little shop "for the sale of anti-opium pills and diffusion of knowledge." The first was the prime object of the shop, but it was frequented by so many literary persons that the doctor added a reading-room, and succeeded in disposing of a number of copies of various translations of scientific works and 7,000 of the pills. This bears a strong resemblance to the temperance coffee and reading-rooms of our Western civilization, though an anti-tobacco or anti-liquor pill of proper efficacy is still a desideratum. The steady increase in the importation of opium into this country (of a value in 1873 of $680,437 for the Chinese in California) should lead some philanthropist to arrange with Dr. Dudgeon for a supply of his antidote.

## THE BOOK OF MARCO POLO.*

II.

THE Italians were emphatically the travellers of the thirteenth century, and though foreign countries accessible only by sea were in general discovered by inhabitants of the Atlantic coast, yet Columbus, Vespucci, and Cabot were all Italians, and, as Burckhardt observes, Italian scholars maintained a literary monopoly in cosmographical description even down to the end of the fifteenth century. Before the birth of Marco, his father and uncle had travelled and resided in the Asiatic provinces of the Greek Empire, whither they resorted "on a venture of trade," and had pushed their commercial campaigns into even remoter regions. Marco's accounts of the consideration which his older relatives as well as himself enjoyed with Eastern potentates, usually so jealous of Christians and foreigners, have been thought highly incredible, but these statements appear to be confirmed by other evidence; and, besides, the position of the family as merchants would serve rather to recommend than to discredit them in Oriental eyes. Commerce was never regarded in the East with the contempt in which it was held by Roman pride—a false pride, by the way, which has rendered it so difficult for modern scholars to extract out of the disdainful reticence of ancient writers any satisfactory notices of the important traffic which was carried on in the days of the Empire between Rome and Oriental countries hardly known even by name to the classic authors. On the contrary, trade, especially with foreign countries, was always an honorable profession in the East. Mohammed, the founder of Islamism, was a merchant, and we learn from Chardin that the kings and nobles of Persia dealt largely in silks, carpets, and precious stones.

In Polo's time, merchants seem to have found less difficulty in distant commercial expeditions than were encountered by trading caravans in the most civilized countries of Europe, where they were exposed to be ransomed and pillaged as often as they came in sight of a stronghold of one of the predatory barons who then infested the Christian world. Long after the time of Polo, the Moslems were less intolerant and barbarous than they became in the course of the wars of conquest which culminated, if they did not terminate, in the capture of Constantinople and the transfer of the seat of Ottoman empire from Anatolia to Rumelia. When, a hundred years after Polo's captivity at Genoa, the king and great lords of France were seeking the redemption of the French princes and nobles taken prisoners by Bayazîd at the battle of Nicopolis, there was found no obstacle in the way of communication and negotiation with the conqueror at his capital of Broussa; and Froissart mentions several Christian merchants who appear to have enjoyed in that capital as great immunities as regular heralds, to have travelled and traded freely in Asia Minor, and even to have been honored with the personal acquaintance and favor of Bayazîd himself. "Syr Dyne of Respōde," says the old chronicler, "was alwayes in their coūsayles [of the French lords], and he sayes ever that the marchaūtes Venisyās and Genowayes myght well helpe and ayde in that busynesse, for he says marchauntes myght go whider they lyste, and day by day they passe and repasse, and dayly marchauntes christened hath entercours with the Sarazins and exchaunge one with another their merchaundyze" ('Chronicle,' reprint, Lord Berners's translation, vol. ii., p. 123). And again: "Syr, the marchauntes of Gennes and other isles are knowen over all, and occupye the trade of marchaūdize in Quayre, in Alexandre, in Damas, in Damiat, in Turkey, and out in farre countreyes hethan, for as ye knowe well marchaūdize flyeth over all the worlde" ('Chronicles,' ii., p. 221). Even in the seventeenth century Chardin writes that he, both as a merchant and as a Protestant Christian, could reside and travel in the heathen East in greater honor and with less molestation than in his native country, Catholic France, then under the "glorious" rule of the *grand monarque* Louis XIV.

The subject of the mutual intercourse and reciprocal influence of the East and the West is full of interest, and the labors of Heeren, Baldelli-Boni, Beauvoir-Priaulx, Weber, and others, among whom Reinaud, author of the learned 'Relations politiques et commerciales de l'Empire Romain avec l'Asie orientale' (Paris, 1863), deserves especial notice, have by no means exhausted it. Mutually repugnant as the Asiatic and the Occidental have always been, they have never ceased to exercise upon each other, if not a sympathetic influence, a fascination like that of the serpent upon his victim. The current of this influence, like the migration of peoples and the course of empire, has generally set westwards, and the sure guide of language, as well as the constant traditions of the Western races, shows that the blood which tingles in our own veins comes by personal descent from tribes shone upon by the rising sun. To that source, too, we trace our religion and many of our laws and social institutions, though, like our languages, often so much disguised and changed as to be hardly now readily recognizable as kindred. The very word Oriental is with us symbolical of splendor and redolent with fragrance. The universal prejudice which led Columbus, by a happy error, to seek for Asia in the West, still survives in popular geography, and the Antilles are called the West Indies, as in Spain Las Indias is still the general designation of Spanish America. The hostile contact of the Hellenic with the Persian race in Asia Minor, and the repulse of Xerxes in his memorable attempt to subjugate Greece, the expedition of the Ten Thousand, and the wondrous campaign of Alexander, checked the influx of Oriental ideas, as well as the irruption of Eastern invaders into Europe; and, fleeting as were the "thrones, dominations, princedoms, powers" into which the Macedonian conquests were divided, the moral and intellectual influence of this reversal of the tide of history is now known to have been substantial, widespread, and permanent. Alexander, under the names of Dhulkarnein [two-horned, Ammon] and Iskander, is still one of the demigods of Asiatic mythology, and late researches have pointed out coincidences between Greek and Asiatic art too striking to be accidental. The illustrations of Col. Yule's interesting and valuable 'Mission to Ava' in 1855 show that even Burmese architecture in its decorative features, its mouldings, and its minor members, is wonderfully like the Hellenic. Here, certainly, the Greeks were not the borrowers.

The gems, and tissues, and dyes, and perfumes, and spices, and medicaments in which the Asiatic world is so rich, excited the cupidity of mediæval Europe as keenly as the "gold and silver and ivory and apes and peacocks" (*qu.* ostrich plumes ?) of Tarshish did that of Solomon and his harem. Even the Scandinavian peddlers and pirates coasted the southern shores of the Mediterranean, cheating the Blámenn, or Moors, with hard bargains, or plundering them with the strong hand, according to circumstances, and though the reprisals of the Moslem on the Nazarene were generally confined to the Mediterranean, yet on several occasions, as late as the seventeenth century, Algerine corsairs returned the visits of the Vikings, landing in Norway, and even in Iceland, and carrying off hundreds of prisoners to toil and die in slavery. On the other hand, though Asiatic taste generally prefers the handiwork of its own artisans, yet the Orientals were not slow to adopt the weapons and other military improvements of the Europeans. The "Rumes" or Rumelian artillerists and engineers whom Albuquerque and other Portuguese invaders of Southern India found in the service of the native princes, were as probably Greek or other Christian renegades as Turks, and even the mosaics of the Taj Mahal were certainly, in part at least, designed if not executed by Tuscan artists. Cunningly wrought glass is an old article of Venetian export to the East, and Chardin states that the art of glass-making was introduced into Persia by an Italian.

The reciprocal intellectual influence of the East and the West is an obscure subject. The Oriental languages are generally difficult of acquisition to Europeans, and though Arabic must have been, to a considerable extent, adopted by the Syrian Christians soon after the Mohammedan conquest of Palestine, and prevailed widely among the followers of both religions in Spain when Haroun al Raschid and Charlemagne exchanged letters and presents, there is little evidence of the pursuit of Indian or even Persian lore by Christian scholars until long after the middle of the sixteenth century, when the Florentine Sassetti detected the relationship between Sanskrit and the languages of Europe. Colonel Yule thinks that even Polo, in his long sojourn in the Celestial Empire, did not learn the Chinese language, though he acquired some other Oriental tongues. Still, some interchange of intellectual as well as material products there certainly was,

*'The Book of Ser Marco Polo, the Venetian, concerning the Kingdoms and Marvels of the East. Newly Translated and Edited, with Notes, Maps, and other Illustrations, by Colonel Henry Yule, C.B., late of the Royal Engineers (Bengal). Second edition, revised, with the addition of new matter and many new illustrations.' 2 vols. 8vo. London: John Murray. 1875.

even at periods of great mental torpor in Christendom. The Sanskrit religious romance of Sâkya-Muni and a disciple became the Romish legend of Barlaam and Josaphat as early as the ninth century, and these Buddhist divinities secured a place in the old Christian martyrologies which they still retain in the festal calendar of Rome.

All this implies much personal intercourse along the borders of Christendom and heathendom, and of course such intercourse could not fail to lead to excursions to the chief internal marts and sources of production of precious wares. There was, besides, not to speak of crusades undertaken to secure to the Christian pilgrim free access to the holy shrines of Palestine, the stimulus of religious propagandism, which brought legions of armed Moslems into Christian Asia and Europe, and sent missionaries of the Cross into every Asiatic country. Although we know that many a Christian apostle penetrated far into mysterious Asia to preach the Gospel of peace to the Paynim, not many of these emissaries have left any record of their missions. One, however, who preceded Polo by but a few years, is too remarkable to be passed unnoticed. We allude to the Minorite friar, Rubruquis, despatched by Louis IX. on a political and religious embassy to the Tartars, translations of whose narrative were published by Hakluyt and by Pinchas. These fully justify the judgment of Colonel Yule, who characterizes this journal as marked by "rich detail, vivid pictures, acuteness of observation, and strong good sense," and as "a book which has few superiors in the whole library of travel." Our editor admits that it is only with rare exceptions that Marco Polo exhibits any of the remarkable intellectual qualities of Rubruquis, and still less does he claim for him "the genius and lofty enthusiasm, the ardent and justified previsions, which mark the great Admiral [Columbus] as one of the lights of the human race." Polo's real title to the regard of posterity, "his indisputable and, in their kind, unique claims to glory" are summed up in the following passage on pp. 103 and 104 of the introduction to this second edition of Polo's travels:

"He was the first traveller to trace a route across the whole longitude of Asia, naming and describing kingdom after kingdom which he had seen with his own eyes—the deserts of Persia, the flowering plateaux and wild gorges of Badakhshan, the jade-bearing rivers of Khotan, the Mongolian steppes, cradle of the power that had so lately threatened to swallow up Christendom, the new and brilliant court that had been established at Cambaluc; the first traveller to reveal China in all its wealth and vastness, its mighty rivers, its huge cities, its rich manufactures, its swarming population, the inconceivably vast fleets that quickened its seas and its inland waters; to tell us of the natives on its borders, with all their eccentricities of manners and of worship; of Tibet, with its sordid devotees; of Burma, with its golden pagodas and their tinkling crowns; of Laos, of Siam, of Cochin-China, of Japan, the Eastern Thule, with its rosy pearls and golden-roofed palaces; the first to speak of that Museum of Beauty and Wonder, still so imperfectly ransacked, the Indian Archipelago, source of those aromatics then so highly prized, and whose origin was so dark; of Java, the Pearl of Islands; of Sumatra, with its many kings, its strange, costly products, and its cannibal races; of the naked savages of Nicobar and Andaman; of Ceylon, the Isle of Gems, with the sacred mountain and the Tomb of Adam; of India the Great, not as a dreamland of Alexandrian fables, but as a country seen and partially explored, with its virtuous Brahmins, its obscene ascetics, its diamonds, and the strange tales of their acquisition, its sea-beds of pearl, and its powerful sun; the first in mediæval times to give any distinct account of the secluded Christian Empire of Abyssinia and the semi-Christian Island of Socotra; to speak, though indeed dimly, of Zanzibar, with its negroes and its ivory, and of the vast and distant Madagascar, bordering on the dark ocean of the South, with its Ruc and other monstrosities; and, in a remotely opposite region, of Siberia and the Arctic Ocean, of dog-sledges, of white bears, and reindeer-riding Tunguses.

"That all this rich catalogue of discoveries should belong to the revelations of one man and one book is surely ample ground enough to account for and to justify the author's high place in the roll of fame; and there can be no need to exaggerate his greatness or to invest him with imaginary attributes."

This "rich catalogue of discoveries," illustrated, rounded out, and completed as it has been by Colonel Yule's great knowledge and laborious researches, forms one of the most important chapters in the history of geographical enquiry, and we earnestly recommend it as an indispensable acquisition to every public library and every comprehensive private collection of books of great and permanent value.

George P. Marsh.

Rome, June 26, 1875.

## THE WAY WE LIVE NOW.*

THE good American will find in this novel not only an entertaining story of modern life, but also a justification for his love of country. Whatever hard things have been said in times past of America by English travellers, English newspapers, and English writers, no description of ordinary American life at their hands was ever made blacker than this picture of English civilization by Mr. Trollope. Whether it is a fair picture or not, we do not undertake to say, but Mr. Trollope is not a satirist, and hitherto his descriptions have been always accounted truthful. Moreover, in the great international controversy which has been raging so long between England and the United States as to which is the worse country of the two, we, on this side of the water, are certainly entitled, black as we may be, to the presumption that such a state of society as Mr. Trollope here describes could not have been absolutely invented, even by so clever a novelist as Mr. Trollope.

The novel contains descriptions of several different kinds of English life—the great world in London; the younger club life in London; genteel English country life and humble English country life; and we are allowed also to get a glimpse or two of the journalistic world in London and of commercial life, and of course learn a good deal of the condition of the matrimonial market. On the whole, we have found the most interesting and attractive part of the book to be that relating to the Bear Garden, a West-End club got up for the benefit of a number of young gentlemen who are after a fashion social reformers. Every one who has ever belonged to a club has observed that the habit of opening it early in the morning and closing at midnight really amounts to a premium upon early hours and the prejudices of the senile class which affects such hours. That carpets should be worn out and morning papers bought and other expenses incurred for the few old dotards who may happen to drop into their club before the afternoon, while the great majority of the members do not get up till two o'clock and begin to play loo and "blind hookey" at midnight, is clearly so much waste. To reform such evils as these the Bear Garden was started; opening at three in the afternoon and remaining open till morning. The chief frequenters of the club with whom the story has to do are Sir Felix Carbury, a young baronet (son of a doting mother) who has run through his property and is rapidly going to the devil; Mr. Miles Grendall, the son of the broken-down Lord Alfred Grendall; Lord Nidderdale; Lord Grasslough; and Mr. Adolphus, or Dolly, Longestaffe. Sir Felix is a confirmed gambler, drunkard, liar, and coward, while Grendall habitually cheats at cards (if we understand a hint thrown out by Mr. Trollope, Sir Felix by-and-by begins to imitate him); Lord Nidderdale is an honest young fellow having his "fling," with no nonsense about him, and intending to marry, not from inclination, but as his father may determine, whenever the "fling" shall have lasted long enough; and Dolly is a young man about town of independent property. Dolly himself is an amusing character, but his family, we are bound to say, is not, his mother being a fool, and his sisters two wise virgins who not only admit to themselves, but almost make public proclamation of the fact, that they are what our friends of the Bear Garden would call "on the marry"; and so plainly does one of them talk about this that she actually loses a husband—an honest old Jew evidently not accustomed to Christian plain speaking—by it.

To return to the club. It is managed by one Herr Vossner, who undertakes to carry it on and relieve the members of all the trouble of superintendence. This the members—all of whom seem, during most of the book, to be nearly born fools—think is an admirable plan; and so indeed it turns out to be, for Herr Vossner. The main occupation of the club, of course, is cards, and, as ready-money is not always to be had for this purpose, the members issue their "paper" for their gambling debts, and when the worst comes to the worst get Herr Vossner to "do" bills for them. All this is natural enough, but the utter indifference of the members to cheating is rather remarkable. Miles Grendall is, as we say, detected at producing an illegitimate number of aces from his sleeve, and this fact is communicated by Sir Felix to one or two of the other members. The only effect it seems to produce on their minds, however, is of regret that so unpleasant a thing should be mentioned; and so they all go on playing with Miles as before. Miles not only cheats, but gives his I O U's to his antagonists in such unlimited quantities, and with such an entire disregard of the necessity of redeeming them, that they become so much waste-paper, being "based" on the entire wealth of Miles himself, which is nil. This, too, one would have thought, would have greatly diminished the pleasure of playing with Miles, but it does not seem to. One evening, Mr. Fisker, the American "financier" of the book, goes to the club and is invited to play, and wins heavily. What is passed over to him, however, is not the coin of the realm, but the elastic currency issued by Miles, of which the losers have a great abundance; and we are rather surprised, on the whole, that one or two of the more conservative players insist on making a little arrangement with Vossner by which they pay Fisker, the next morning, in hard money. In the end the club is found closed one fine day, Vossner having absconded

* 'The Way We Live Now. A Novel. By Anthony Trollope. With illustrations.' New York: Harpers. 1875.

over-night with the spoons, and having sold the paper in his possession to another gentleman, strongly suspected of being his partner.

Mr. Augustus Melmotte, one of the leading characters of the book, is a Continental sharper, who has risen from the gutter to the possession of great wealth, and has settled in London for the purpose, among other things, of getting social position. He is ignorant, arrogant, is rather a suspected character, and yet he gets on swimmingly in London society. His daughter becomes engaged to Lord Nidderdale, and he himself is elected to Parliament from Westminster, though so totally unaccustomed to the ways of Parliamentary life that he begins his first speech in reply to one of the members of the House by getting up with his hat still on and exclaiming, "Mr. Brown is all wrong," and on a cry of order being made, adding, "Yes, you are," frowning angrily at the member in question. The general tone of English manners described in the book is so peculiar that we should not ourselves have been sure that there would be anything out of the way in all this; but we have Mr. Trollope's word for it that Mr. Melmotte's manner of addressing the House was unparliamentary. His daughter Marie falls in love with Sir Felix Carbury, who is advised by his mother, Lady Carbury, to run away with her, and actually makes an appointment to do so. She is supposed to be a great catch, and it is on this account that Lady Carbury desires the marriage. Unfortunately, at the last moment, after Marie has arranged all the details of the elopement, and Sir Felix has got the necessary money to carry them both to New York (they are to be married on board ship), he imprudently gambles it all away, and, being too drunk to remember the engagement, naturally misses the train for Liverpool. It ought not to be forgotten, as illustrating the constancy and fundamental shrewdness of Lord Nidderdale and his father, that the latter, notwithstanding the attempted elopement—for Marie herself did actually go to Liverpool with her maid to meet Felix—consents to a re-engagement with her, which is only finally broken off with the general smash-up of the Melmotte establishment brought about by the discovery that Augustus himself is a forger.

There is not wanting an American swindle, which consists of a railroad line to connect Mexico with California. This project Fisker and Melmotte father, and the operations of the directors on the London market consist, of course, of the usual hocus-pocus with shares issued and tied up at the same time, brilliant prospectuses, and very little railroad-building. What strikes us chiefly about this part of the book is the extraordinary folly of the English public, which can be induced to invest in an enterprise presided over by Melmotte, assisted by the young gentlemen of the Bear Garden, who go into the management as ornamental directors, but who do not pretend, in their very open and unguarded conversation, to know anything about the scheme or to have the remotest idea of its merits.

Mr. Trollope's picture of the literary life of London is entertaining, but it is not fresh. We have heard something before now of that dishonest tribe, the critics, and it hardly needed the amusing correspondence of Lady Carbury, the doting mother of Sir Felix, with the three editors of the *Beehive*, the *Morning Breakfast-Table*, and the *Evening Pulpit*, on the subject of her venture, 'Criminal Queens,' to show the real relation between authors and the conductors of the press in London. How Lady Carbury cajoles one editor and throws herself on the mercy of a second, and allows a third, without too much reproof, to kiss her in a moment of frenzied admiration, need not be told, nor how little her manœuvres help the sale of 'Criminal Queens.' Poor Lady Carbury, whose severe literary labors are only varied by the performance of the maternal duty of letting her son in at daybreak, when he is in a condition that renders the use of his latch-key difficult, has a hard life, and it would have seemed only fair for the author to have disposed of Sir Felix in some way before the novel ended. But though he is terribly mauled on one occasion by honest John Crumb, who suspects him, not without reason, of dishonorable designs with regard to the young woman John desires to marry, he makes no sort of resistance, but allows himself to be beaten like a cur, and so preserves his valuable existence, to the inevitable future misery of his mother.

Paul Montague, the honest young man of the book, is so extraordinarily weak that we cannot help wondering that he comes out as well as he does. He is always getting into some mess, either being engaged to one woman when he is rapidly becoming interested in another, or gambling, or getting his property involved, or entangling himself in some other way. He is well-drawn, as all the characters in the book are, but, one asks, why should so feeble a creature be thought worth drawing at all? He is in love with Hetta Carbury, and has been engaged to Mrs. Hurtle, an American widow, who has killed her man and been divorced from her husband, but with all her eccentricities is perhaps the nicest person in the book; and with Hetta her cousin Roger Carbury is also in love. Roger is an honest country gentleman, who is almost removed from the main current of the story, and who evidently thinks that "the way we live now" is not at all a good way to live.

On the whole, it is impossible to read "The Way We Live Now" without feeling that life, at any rate in certain quarters, is getting even with literature very fast. The best writers of fiction have always maintained that even in novel-writing there was some room to improve upon nature, either in the plot or in the characters, or the combination of the two; but if modern society is to be really made up of the Carburys and their friends, and the Melmottes are to lead it, we are free to confess that we think literature must lag far behind the reality. A novelist may describe it, and describe it entertainingly, as Mr. Trollope does, but cannot idealize it very much. It is on this account that we have the less doubt that Mr. Trollope has given a lifelike picture of "our Best Society."

---

*Report upon the Condition of Affairs in the Territory of Alaska.* By Henry W. Elliott, Special Agent Treasury Department. (Washington: Government Printing Office. 1875. 8vo, pp. 277.)—We have already referred (*Nation*, Feb. 4, 1875) to the volume in quarto printed by the Government in 1873 on the habits of the fur-seal of Alaska and the seal-fisheries in general. The volume which now lies before us is by the same author, and contains enlarged data on the same subject, together with a variety of other matter. Of its contents, five pages are devoted to prefatory remarks, ten to an essay on the character of the country, thirteen to the natives of Alaska and their condition, six to the duty of the Government with regard to the Territory and its people, fifteen to the nature and statistics of the fur-trade, nine to the sea-otter trade, fifty-eight to the condition of affairs on the Seal Islands, forty-four to the habits of the fur-seal, walrus, etc., three to the cod and salmon fisheries, forty-five to a reprint of the ornithological notice of the Prybilov Islands, by Dr. Coues, which first appeared in the Report of 1873, and the remainder to an appendix, consisting of notes on St. Matthew and St. Lawrence Islands, correspondence, statistics, extracts from Veniaminoff's 'Zapieska' (1840), and the law of Congress and regulations of the Alaska Commercial Company relating to the seal fisheries. The Report is not illustrated.

Mr. Elliott's first visit to Alaska was about the year 1866, when he passed from the British head-waters of the Stickeen River to the seaboard on his way to Victoria. In the spring of 1872, he was sent by the Treasury to the Island of St. Paul, touching on his way at Unalashka. He wintered at St. Paul, spending part of the following spring at St. George, and returning to San Francisco via Unalashka in August, 1873. In 1874, Congress appropriated $20,000 for two years' investigation by Mr. Elliott of "the present condition of the seal-fisheries of Alaska; the haunts and habits of the seal; the preservation and extension of the fisheries as a source of revenue to the United States, with like information regarding the fur-bearing animals of Alaska generally; the statistics of the fur-trade, and the condition of the people or natives, especially those upon whom the successful prosecution of the fisheries and fur-trade is dependent." Some members of the House having expressed themselves sceptical as to the ability of the gentleman named to carry out fully the intent of the bill alone, an officer of the Navy (Lieut. Washburn Maynard) was added to the commission. His report, however, is not printed with that of Mr. Elliott. These gentlemen sailed for the Seal Islands in the spring of 1874, touching at Sitka and Unalashka, and spending some weeks on the sealing grounds. In July they examined the uninhabited island of St. Matthew, and touched at St. Lawrence, at both places adding to our geographical knowledge, as they had previously done at St. Paul. They then returned to Unalashka, and sailed thence directly for San Francisco.

The general conclusions at which Mr. Elliott arrives are: That the agricultural resources of the country are *nil;* the mineral resources promising, though hardly to any extent investigated; the salmon-fisheries extensive and likely to be made productive; the cod-fisheries sufficient only for a local supply; that the seal-fisheries may be indefinitely carried on on the present basis without diminishing the supply; that firearms should be prohibited in sea-otter hunting and a summer close-time established; that the condition of the natives is far better than under the Russian rule; that the Alaska Commercial Company exhibits praiseworthy regard for the welfare of the people, and that its interests are identical with those of the Government and the natives; that there "is absolutely no law, no means of protection, no redress for injury, for any citizen of the United States even, to say nothing of natives" (pp. 233, 237, ¶ 4); that the troops should be removed from Sitka and a steam revenue vessel substituted for them, to traverse the Territory and carry the mails; that supervisory agents and school-teachers for the Aleuts would

"amount to nothing but discord and mischief" (p. 238); and, finally, that "it would be wrong to hint that the country is worthless, for on the Seal Islands alone the Government possesses property which would not remain in the market many days unsold were it offered for seven millions, and from which the annual revenue is doubly sufficient to meet all expenditures for the proper government of the whole Territory, if the matter was correctly adjusted." Mr. Elliott also thinks that the headquarters of the Territory should be removed from Sitka to Unalashka or Kodiak, as being nearer the centre of trade and civilized population.

Could we accept these conclusions without reserve, the showing, in a pecuniary point of view, would be more favorable than some of the reports concerning the Territory which have come to hand. Mr. Elliott has certainly made himself an authority on the habits of the fur-seal and the character of the islands on which they sojourn. His contributions to our knowledge of them and to our general geographical knowledge of some of the other islands of Behring Sea, are valuable and important. The name of Dr. Coues is a sufficient guarantee of the character and interest of the ornithological notes. The translations from Veniaminoff are of interest chiefly as relating to the conditions of thirty-five years ago. But when we examine the chapters on the present condition and character of the Territory and its inhabitants in the light of the itinerary above given, we find that they are based almost exclusively on the notes of Veniaminoff and information derived (as far as acknowledged in the Report) from individuals now or lately in the employ of the Alaska Commercial Company. Mr. Elliott's ocular observation has not extended over more than one and a half per cent. of the whole Territory; he has never touched the mainland of the Territory except at the Stickeen River; his actual residence has been confined to two little barren islands containing an area of not over 150 square miles. When, therefore, he says (p. 4) that he has "given the Yukon, Aleutian, and Sitkan districts close attention, having yet to more fully examine the Kodiak, Cook's Inlet, and Copper River districts," it would have been less misleading to the reader if he had stated that he has visited Unalashka in the Aleutian district; four islands in Behring Sea; Sitka and the Stickeen in the Sitkan district; and, for the rest, has collected reports from traders and other sources. How a "careful study of the history and habits of the sea-otter" is compatible with absence of personal observation of the living animal and the localities it inhabits, and how "old experienced fishermen whom I have met in the country personally engaged in fishing in these waters" (p. 5), from whom he professes to have derived his opinion of the value of the cod-fisheries, could have been met when Mr. Elliott has never visited the fishing-grounds, is not very clear. It would appear as if the Government might save the expense of agents and establishments on the Seal Islands by doing away with them altogether, if the interests of the Company are so clearly identical with those of the Government and natives as Mr. Elliott would have us (p. 95) believe. It would certainly seem, if no law, redress, or protection is to be obtained by whites or natives, that some action to establish such law and protection is called for from the Government. In this part of the world also an impression prevails that officers of law, clergymen, and school-teachers are capable of something beside discord and mischief, and that well-disposed natives have something of a claim to an education of a primary character, especially when they have enjoyed it under the despotic rule of Russia.

The Report is also marred by occasional errors of fact. On p. 17 we are informed that the temperature at Unalashka for July and August, 1831, did not rise above 35° Fahr., and that evenings were common with as low a temperature as 12°. A reference to Veniaminoff shows that the *minimum* for that period was 39.4°, the mean temperature 46.8°, and the maximum 64.6° Fahr. The statement on p. 20 that the Aleuts and Kodiak people with the inhabitants of the peninsula constitute one "decidedly distinct race" and the "Indians occupying all the rest (!) of the inhabited country" another; with that on p. 21, that the Eskimo of Kodiak have "no natural or blood affinity" with the Aleuts, might well astonish such veteran observers as Wrangell, Von Baer, and Erman. Again, on page 85, we are told that the "best" raw (fur-seal) skins are worth only $5 to $10, when the records of the London trade-sales show an average price in gold obtained for them of nearly double the amount stated (58–75s.) during the last four years.

We would suggest as an easy method of settling the vexed question of the value of Alaska for settlement that it be laid open to settlement by law of Congress, suspending the usual surveys until it be seen whether the expense would justify them. Then, if such deluded people as the Icelanders—who have examined the country and formed a different opinion from that evolved by Mr. Elliott—wish to settle there, they may freely indulge their propensity; and should they, in view of this Report, decide to stay away, no harm would be done to any one.

*A Summer in Norway*, with Notes on the Industries, Habits, Customs, and Peculiarities of the People, the History and Institutions of the Country, its Climate, Topography, and Productions; also, an account of the Red Deer, Reindeer, and Elk. By John Dean Caton, LL.D., ex-Chief-Justice of the Supreme Court of the State of Illinois. (Chicago: Jansen, McClurg & Co. 1875.)—Judge Caton has done what travellers in Norway are very apt to do: with an ever-present sense of adventure, as if he were exploring the heart of Africa or some equally unknown region, he has hastened, note-book in hand, from place to place, perused some random translation of the Sagas, and in this way gathered a miscellaneous mass of quite curious though sometimes inaccurate information, all of which he has with a due admixture of personal matter expanded into a book of formidable dimensions. The present work, although containing a great deal which can hardly interest any but the author's own friends, has at least the merit of being written in a very genial spirit, and the Norwegians have every reason to feel gratified at the flattering account which our author gives of their country, manners, and institutions. We do not mean to imply that this account is not, from Mr. Caton's point of view, in the main correct, although, to be sure, the voluminous title-page does seem to hold out a larger promise than the succeeding pages manage to keep.

When the author has occasion to use his eyes, he invariably uses them well, and his judgments of the Norwegian character—and, in fact, of everything relating to the present condition of the country—are remarkably sound and unaffected by prejudice either *pro* or *con.*; but, whenever he allows his mind to stray into the regions of the past, he loses himself, and soon betrays that he is hopelessly at sea. A jumble of isolated facts, gathered from random sources, is not history, neither can it be honored with the title of "historical notes." The simplest fact of history, in order to be properly represented and understood, requires a tolerably accurate knowledge of the whole civilization to which it relates, and this knowledge Mr. Caton does not possess. His standard of judgment is invariably that of the nineteenth century, and it is needless to say that heroes like Olaf Trygvesson and Saint Olaf (or Olaf the Holy, as Mr. Caton calls him), measured by this standard, do not appear to advantage. Here is, for instance, a passage which strikingly illustrates the author's want of historical perspective: "Had Olaf [Trygvesson] adhered to the monogamic teaching of Christianity, and been content with a single wife, he might have reigned long enough to have allowed the new faith to have taken root, but he must marry another wife, and go and claim her dower at the point of the lance." Again, on page 187, he administers a wholesome rebuke to Gyda, whom Harald the Fairhaired wooed, because, prompted by foolish ambition, she exacted of her lover that he should conquer all the kingdom of Norway, instead of marrying him for love while he was yet comparatively poor and unrenowned. But, after all, there were some ameliorating circumstances. "It may not be easy," he adds, in apology of her conduct, "for those of this generation, when staid and monogamic habits have revolutionized the sense of the proprieties of life, to understand how the triumphant bride could feel no humiliation in the knowledge that she possessed but a fraction of her husband's love, and share the royal couch with half-a-dozen wives, more or less" Evidently, Mr. Caton is not blest with too much humor. No wonder, therefore, that he can muster but little sympathy for "the insupportable bigotry and superstition of the pagan religion" (page 193); it is all an abomination to him. And still, knowing the tenacity with which the Norsemen clung to this barbaric faith, he has nothing but blame for the really great and powerful king, Saint Olaf, who, unwilling to accept a compromise, sacrificed his life in the effort to Christianize his kingdom. The means he employed were, judged from our present enlightened point of view, objectionable; therefore "this precious saint," as our author thinks, was worthy of no honor.

It is in no way surprising that Mr. Caton repeats the error, so common even among the more scholarly writers on Scandinavian history, of translating the word *viking* by the English "sea-king"; and, for the information of others, be it here stated that the word is not derived from *vi* (which, by the way, in Old Norse means nothing) and *king*, but from the word *vik* (a bight, bay) and the substantive termination *-ing*, as in English *tithing*, *whiting*, and consequently refers to the custom of the vikings of running into sounds and bays to seek booty and plunder. A reference to Vigfússon and other authorities will convince any one that this etymology is well established. When, however, the author in other places speaks of "Jarls or Vikings," and, again, of "Jarls or kings," he has not even the excuse of precedent for his blunder.

Mr. Caton's literary style is by no means above criticism. The inelegance of constructions like the following is self-evident: "With him he lived six years, who seems to have treated him well, without making him

feel the pressure of bondage," etc. ; and again, on the same page : "Here he lived under the protection of his uncle, making great proficiency in all athletic accomplishments, in *which* he showed a dexterity and courage far beyond all other boys of his age, *which* gave promise of his wonderful future." The spelling of proper names is no less capricious than is that of Mr. Carlyle in his late work on the 'Early Kings of Norway.' We find, for instance, *Haagan* for *Hákon* or Danish *Hagen; Bjarn* for *Bjarne*, etc. But, in spite of these and other minor deficiencies, we have no hesitation in recommending Mr. Caton's volume as, on the whole, an entertaining and, in everything which relates to the life of to-day, very satisfactory account of what it purports to describe. The visit to the Lapp encampment is an interesting bit of narrative, and the author's reflections on the Norwegian industries, national customs, and government are well worthy of notice, betraying, as they do, a keenly observing and practically intelligent mind. He is, as far as we know, the first foreign traveller who has given anything like a correct statement of the nature of the union between Norway and Sweden.

*The Primer of Political Economy.* In Sixteen Definitions and Forty Propositions. By Alfred B. Mason and John J. Lalor. (Chicago : Jansen, McClurg & Co. 1875.)—Messrs. Mason and Lalor, in preparing their 'Primer,' have set themselves the modest task of presenting the Smith-Ricardo-Mill system of political economy in the simplest and sharpest manner. Whatever criticisms may be justly made upon the details of this system, it is unquestionably the one which ought to be adopted as the basis of any such popular work. The 'Primer' contains what ought to be known in regard to political economy by every schoolboy and every voter.

HADLEY'S

*Language Series.*

Hadley's Lessons in Language, price 60 cts.

Lee & Hadley's English Grammar, $1.

HADLEY'S LESSONS IN LANGUAGE was the first book ever published with this or any similar title ; it was the pioneer in this direction, and from its intrinsic merits has attained a popularity seldom reached by any book.

LEE & HADLEY'S ENGLISH GRAMMAR, prepared expressly to follow the 'Lessons in Language,' contains more of originality, both as to matter and manner of presentation, than any other book on the same subject. We can furnish numerous testimonials on application. Every teacher interested in teaching MORE of the practical use of language, and LESS of the dry technicalities, should examine these books.

For examination, single copies will be mailed on receipt of two-thirds retail price.

HADLEY BROTHERS & CO., Publishers,
63 and 65 Washington Street, Chicago, Ill.

*BOOKBUYERS* will find their orders executed with intelligence and promptness by GEO. E. STEVENS & CO., Booksellers, Cincinnati, O.
Letters of enquiry as to prices, etc., are invited. Any books will be carefully forwarded on receipt of their advertised price.

*Musical Novels.*

*COUNTERPARTS.* By Elizabeth S. Shepard.
"A charming musical story of more than ordinary ability, and most deservedly stands high in the ranks of fiction."—*Standard, New Bedford.*

*RUMOR.* By Elizabeth S. Shepard.
"Is no common story. It has scenes and sentiments of singular force, individuality, and beauty."

*CHARLES AUCHESTER.* By Elizabeth Shepard, author of 'Counterparts' and 'Rumor.'
Each of the above in 1 vol. 8vo, paper, new style, 15 cents, and in 1 vol. 8vo, cloth, $1 25.
☞ Sent, post-paid, on receipt of price by

SUCCESSFUL SCHOOL-BOOKS.

*FIRST STEPS IN ENGLISH LITERATURE.* By Arthur Gilman, M.A. 16mo, cloth, $1.
"Valuable alike for reference by the scholar and as a guide for the student."—*Christian Union.*
"Remarkable for fairness and precision."—*New York Evening Post.*
"Clear, compact, and complete."—*Boston Journal.*

*FIRST STEPS IN GENERAL HISTORY.* By Arthur Gilman, M.A. 16mo, cloth, $1 25.
"It invites comparison with Mr. Freeman's 'Outlines of Universal History.' For a text-book in our common schools, Mr. Gilman's book is the better adapted of the two."—*Christian Register.*
"Accurate and impartial."—*Literary World.*
"It has many excellences."—*New York Nation.*

*ELEMENTS OF PHYSICAL MANIPULATION.* By Edward C. Pickering, Thayer Professor of Physics in the Massachusetts Institute of Technology. 8vo, illustrated, cloth, $3.
"Much better for educational purposes than any text-book of physics yet in print."—*New York Tribune.*

*COLBURN'S ARITHMETIC.* Intellectual Arithmetic upon the Inductive Method of Instruction. By Warren Colburn, A.M. 16mo, 40 cents.
"Everything I have seen confirms me in the opinion which I early formed, that 'Colburn's Arithmetic' is the most original and far the most valuable work upon the subject that has yet appeared. Where it has been used, and properly used, in a school, I find an intelligence and readiness in the process of mental arithmetic which I look for in vain in cases where the instruction has been conducted upon principles foreign to those which Mr. Colburn introduces."—*George B. Emerson.*

*** Special terms for introduction. Correspondence with Teachers solicited by the Publishers,

HURD & HOUGHTON, NEW YORK;
THE RIVERSIDE PRESS, CAMBRIDGE.

*"Education" in the Atlantic.*

To the able departments on Recent Literature, Art, and Music, the Publishers of the ATLANTIC MONTHLY have recently added one on Education, which contains, each month, a discussion of educational topics and careful reviews of new text-books. There is a special reason, therefore, why teachers should subscribe to the ATLANTIC, because it contains the expression of the ripest thought and most delightful literary art in America ; the best poems, the best novels, the most entertaining and elevating literature, and the most thoughtful discussion of educational topics.
Terms, $4 a year, postage free. Published by
H. O. HOUGHTON & CO., BOSTON ;
HURD & HOUGHTON, NEW YORK.

A WORK OF GREAT INTEREST
JUST PUBLISHED BY
*S. C. Griggs & Co., Chicago.*

*NORSE MYTHOLOGY ;* or, The Religion of Our Forefathers. All the Myths of the Eddas carefully systematized and interpreted, with an Introduction, Vocabulary, and Index. By R. B. Anderson, A.M., Professor of Scandinavian Languages in the University of Wisconsin. Crown 8vo, cloth, $2 50.

"We claim for this work that it is the first complete and systematic presentation of the Norse Mythology in the English language."—*Author's Preface.*

The subject is treated under three grand divisions : First, THE CREATION ; second, THE LIFE AND EXPLOITS OF THE GODS ; and third, RAGNAROK (DESTRUCTION) AND REGENERATION. The first book gives the attempt of our ancestors to account for the origin of things—a sort of pictorial Genesis ; the second gives their conceptions of what we term Providence ; the third dramatically relates how evil finally destroys the existing universe, and how divine goodness restores creation to its original purity.

In short, this work brings before us the religion of our ancestors, and this is the soul of their history.

"There is," says MAX MULLER, "after Anglo-Saxon, no language, no literature, no mythology so full of interest for the elucidation of the earliest history of the race which now inhabits these British Isles, as the Icelandic. It contains the key to many a riddle in the English language and to many a mystery in the English character."

In this old Norse Mythology we see the infant thought of man opening itself with awe and wonder on this ever-stupendous universe, recognizing the forces of nature as god-like, stupendous personal agencies—as gods and demons.

We have an interest in these old Eddas, for Wednesday still speaks of Woden, or Odin and Thursday still tells of Thor the God of Thunder, while Friday keeps still green the memory of Friga the Goddess of Love. So also Tuesday keeps the name of Tirv (Norse Tir) the God of War.

Professor Anderson has in this book opened up to the American public what must otherwise have remained a sealed fountain. His style is lucid, terse, and graphic : clear in conception and vigorous in expression.

By the same Author.

*AMERICA NOT DISCOVERED BY* Columbus. A Historical Sketch of the Discovery of America by the Norsemen in the Tenth Century. By Prof. Anderson. With an Appendix on the Historical, Literary, and Scientific Value of the Scandinavian Languages. $1.

"A valuable addition to American history. The object is fully described in its title-page, and the author's narrative is very remarkable. . . . The book is full of surprising statements, and will be read with something like wonderment."—*Notes and Queries, London.*

*NORWEGIAN-DANISH GRAMMAR* and Reader. With a Vocabulary, designed for American Students of the Norwegian-Danish Language. By Rev. C. I. P. Peterson, Professor of Scandinavian Literature. Price $1 25.

*PREHISTORIC RACES OF THE* United States. By J. W. Foster, LL.D. 415 pages, crown 8vo, illustrated, price $3 50.

"One of the best and clearest accounts we have seen of those grand monuments of a forgotten race."—*London Saturday Review.*

*NEW YORK, THURSDAY, SEPTEMBER 9, 1875.*

## The Week.

MR. GRATZ BROWN has emerged from a long retirement to write a voluminous letter on the currency, and, as might have been expected, his vision is dazzled by Kelley's 3-65 scheme. He thinks legal-tenders should be the only current paper-money; that the bank monopolists should all be swept away; that the greenbacks should, however, be convertible at pleasure into "3-65 bonds." The properties he ascribes to these bonds show that he looks on them as something like a talisman—something almost supernatural, in fact. If half what he says about them be true, Kelley will stand higher in history than Copernicus, Galileo, or Newton. They would, he thinks, absorb a large amount of idle capital at once, and would then attract "hundreds of millions" of money belonging to brokers and bankers and "savings institutions"; they would distribute the currency evenly and equitably among all the small traders and farmers; they would "repose," he says (which is a finer word than "base"), on the credit of the Government, and "represent the whole wealth of the country"; they would keep gold at home and prevent its being exported—a consummation which the Kelleys and Browns always speak of as if it were the New Jerusalem—and would wipe out the premium on it; they would cause a permanent reduction in the rate of interest, and enable a man to borrow at the same rate here as in England—thus upsetting the theories of the effete economists about the dependence of the rate of interest on the abundance of capital. Mr. Brown says, in fact, that "there is no substantial reason" why the rate should be higher in San Francisco than in London. The bonds would also "revive a now extinct commerce," "create a balance of trade," and lower the rates of freight on the railroads. The indirect effects of such a mighty instrument on morality and religion this great thinker does not point out, but then he knows it is not necessary: his readers can imagine them. He concludes with the characteristic and solemn remark: "If there be any question worthy the serious consideration of the national authority, that claims control of the money of the land, it would seem to be that of the reduction of the rate of interest." On this we humbly differ with the Western philosopher. We think the supply of a good digestive pill to the farmers and mechanics of the land by the National Treasury a far more serious question. The effect of such an agency on freights, interest, prices, credits, crops, would be vast and permanent, and if sold in boxes at $3 65 the gross, would possess most of the regulative features of Kelley's great discovery.

---

Apropos of the rate of interest, the *Financial Chronicle*, in some remarks on the difficulty farmers in this country have in borrowing on mortgage, ascribes it to the knavish tricks of London brokers with foreign securities, as illustrated by the recent report of the Committee of the House of Commons on the foreign loans contracted in that market, and thinks if those brokers were more moral, and the English public were better informed, a large amount of foreign capital could be borrowed by American agriculturists at moderate rates. We are rather surprised to see so delusive a statement put forward by a financial paper of such good standing. Nothing is more certain than that any cloud which now hangs over American credit in England and Holland is due to the extensive defaults in American railroad bonds, to the dishonest management of American railroad corporations, and to the hostile legislation of Western States, and the wild and furious denunciations of capitalists and money-lenders indulged in by Western politicians during the last two or three years. To offer the Farmer any other explanation is to impose on his credulity. Moreover, as every economist knows, or ought to know, the cause of the low state of agricultural credit in the United States is a permanent and natural one. The reason why American savings-banks or capitalists do not like to lend money on farms is the reason why English capitalists are not likely to lend it, viz., the abundance and cheapness of land, and the consequent difficulty of selling it. A mortgage which a creditor cannot foreclose without buying in the property himself, cannot be attractive to money-lenders. Careful investors here do not like to lend on land outside the cities, and most of the farmers have therefore to borrow of local usurers, who are willing to take the pledge themselves in case of default. The state of things in France, the example of which the *Chronicle* cites, is totally different. There land is scarce, eagerly sought, and bought by the peasantry themselves at fancy prices, and if not sold can always be readily let at a paying rental. The great depreciator of agricultural credit in this country is the Government, which lets a man have a farm for a song.

---

Mr. Geo. O. Marcy writes from Boston to the New York *Tribune* denying that the Illinois Pike County levee bonds are in any danger of repudiation, and giving various legal reasons why they cannot be repudiated, inasmuch as the money, which is a lien on the lands improved by the levee, is collectable by the State, and is paid into the State treasury, and paid out by the State, moreover, to the bondholders; and as the county in its corporate capacity has nothing to do with the matter, the commissioners to issue the bonds on the petition of the landholders whose property is to be benefited being appointed by the County Court; and as the legality of the bonds has been affirmed by the opinion of Judge Trumbull and the judges of the Supreme Court. This is all very well as far as it goes, and the correspondent of the *Tribune* on whose letter we based our recent remarks on this subject, seems to have been misinformed on some important points. But we have to remark that the bondholders, after they have paid their money, are apt to be "bloated"; that in taking interest from the Farmer whose lands have been improved they are "drawing his life-blood"; that while they are making probably eight per cent. he is perhaps not making four per cent. in his business, whereas he ought to make twenty; that a large number of these bondholders are probably sitting idle in their parlors or engaged in stock-gambling, while the Farmer is sweating over the plough and the hoe; that, as regards the judges, their sympathy with capitalists is well known; and that, even if the present judges of the Supreme Court have given opinions favorable to the validity of these bonds, other judges can be got, if the people choose, to take their places, who will give a different opinion.

---

No statement of the condition of the affairs of the Bank of California has appeared during the week, although there has been a continuance of contradictory despatches from San Francisco. The newspapers published there which have been received by mail give a very different account of what immediately preceded the failure from that which was sent by telegraph, and it is now more than a matter of conjecture that the failure, unsound as the bank is conceded to have been, was precipitated by speculative combinations such as Wall Street is familiar with. There appears now to be no doubt that the creditors of the bank will be paid in full, and there is talk of a reorganization and a continuance of business with new capital, of which it is said over $7,000,000 has already been pledged. The other banks which suspended have been making preparations to resume. To strengthen themselves and to strengthen the general position there, gold has been ordered from New York. The Treasury were early compelled to decline making transfers of gold from New York, its stock of coin in the San Francisco Sub-Treasury having been reduced as low as was considered

prudent. On Monday, however, it consented to grant transfers to the extent of $1,000,000, the San Francisco Sub-Treasury having received a large amount of coin from the Mint. The fear that these transfers (which can only be made on account of New York bankers by their first depositing gold in the Sub-Treasury here) would deplete the New York gold market strengthened the price of gold here to the extent of advancing it above 115. The Treasury policy in the matter of bond redemptions, particularly on account of the Sinking Fund, has reduced the stock of gold here in the banks to about $10,000,000. This small stock, together with the prospect of a drain to San Francisco, has demoralized foreign exchange, and made possible such a decline in the rates for sterling as to justify the importation of gold before the cotton crop is fairly marketed. Outside the gold and foreign-exchange markets Wall Street has been featureless, with money easy to obtain on good collateral. The New York banks still have a surplus reserve of nearly $20,000,000, and do not expect at any time during the year that the rate of money will go above 6 per cent. The business outlook continues favorable; a fair volume of trade is doing with the Eastern and Middle and a large trade with the Southern and Western States. Credits are granted with care, and there is every sign of health and soundness. There is now no doubt that the staple products of the country for the year are much above the average, and it is certain that Europe will require more grain from us than last year.

---

The contest for the Republican nomination for governor in Massachusetts promised a short time ago to be remarkable for the number and variety of the candidates if for nothing else; but as the day for the Convention draws near, the usual processes are thinning the numbers. A struggle for the office between the friends of Charles Francis Adams, George B. Loring, Mr. Talbot, Mr. A. H. Rice, and Mr. Washburn would have been a curiosity, but not more curious perhaps than that, as the crisis approaches, the knowing ones should begin to predict the greatest strength for Dr. George B. Loring. Mr. Washburn, to be sure, is not a very strong candidate, nor is Mr. A. H. Rice much known outside of Boston, while Mr. Adams has been rather talked about as a candidate, down to the present time, in the newspapers, than actually considered by the politicians; but why it should happen that after all these years we should hear of Dr. Loring as a party necessity, strengthened, too, by the withdrawal of Mr. Talbot, we do not understand. Dr. Loring is a smooth, oily, oratorical place-hunter, who has notoriously for many years been "in the hands of his friends" whenever an important office became vacant. No one can have any particular objection to his being elected, for even the charge brought against him that he is "Butler's friend" does not seem to have very much in it when we remember that he is, by profession, everybody's friend, and he would make rhetorically what might be called a truly centennial governor; but we cannot help wondering whether the Republicans in Massachusetts have really come to this at last, that they have no better man to put forward than he. There is really no difference of principle between the two parties in Massachusetts. Both are for hard money, against a third term, against centralization, and firm believers in equality before the law, so that there is really no appreciable issue except in the character of the candidates they put forward.

---

The trials of the Georgia negroes seem to have come to a sudden end, the ringleader, Harris by name, having been acquitted, and a large number of his confederates having been released from custody. Harris's is understood to have been a test-case, and it is hardly probable that the Government will be able to bring forward any stronger evidence in the other postponed cases. A correspondent of the *Tribune*, who has been travelling in the State, reports that the only result of this extraordinary "plot" is the creation of a feeling of distrust between the two races much to be regretted, as likely to lead to an emigration of the blacks. Admitting that there is no sufficient foundation for this mistrust, he thinks nothing will persuade the blacks that the whites mean them no harm, while nothing will persuade a certain portion of the white population—*i. e.*, the young men who have kept up the traditions of "chivalry"—that the very existence of crime is due to any one but "niggers." He represents the negroes as talking of emigration *en masse*, and the whites as saying substantially that "the d—d niggers can go for all they care." No doubt the exclusion of the blacks from juries does something to increase the dissatisfaction, but we strongly suspect that much of this kind of talk about race-hostility, oppression, and emigration is of that kind which relieves the human breast, black or white, by an expression of a sense of injury, but does not necessarily lead to the purchase of railroad tickets. The dread of the proud white man by the "nigger," or the scorn felt for the latter by him, are not less certainly than the loathing felt on the Pacific coast for the heathen Chinese; and the laws of the United States, or even of the State of Georgia, affecting the negro, are tenderness itself compared with those affecting the Chinaman passed every now and then by the statesmen of the Pacific slope; and yet the emigration from China to California increases with every year. To judge by the extremely moderate behavior of the whites during the recent disturbances, the Georgia negroes, as a class, are treated with more consideration and justice than the Chinese in California, or, we may add, the "bloated bondholder" in one or two of the Western States.

---

General Barlow, associated with Mr. O'Conor in the Tweed cases, has written another letter on the subject of the Court of Appeals decision, bringing forward the authorities which make against it. They certainly show, it seems to us, that the Court would have been amply supported by precedent had it determined to decide the other way, there being quite as good law on one side as the other. To any one who cares that the Bench should enjoy popular respect, the present position of the Court of Appeals is certainly pitiable. Having the whole matter entirely in its own hands, and having to decide one of the most important criminal cases that have arisen in the history of the State, they decide it in such a hasty and slovenly way that they are publicly accused by one eminent counsel practising before them of corruption, and plainly proved by him and his associate to have overlooked or slurred some of the most important cases bearing on the decision, and their opinion becomes at once the shuttlecock of the bar and the press. This is what comes of putting political jurists and "statesmen" on the bench, and leaving the best lawyers to practise before, browbeat, intimidate, and abuse them—some of the best of the profession not caring to conceal, even in print, the contempt with which they are regarded. This is a bad state of affairs. What renders it ludicrous is to have Tweed's friends exhorting us not to forget ourselves so far as to criticise this august tribunal.

---

The Rapid-Transit Commissioners have come to the conclusion to which we suppose nine-tenths of the people who have looked into the matter must have expected them to come. They have made a report that they have "selected" two routes, one on the East and one on the West side of the city, nearly coinciding with the lines of the Greenwich-Street road, partly built and soon to be completed as far as Central Park, and the Gilbert Elevated Railway Company. They very naïvely admit, first, that they were shut out from the possibility of considering many attractive routes by the certainty of opposition from the Common Council and the landowners, and they have, as a matter of fact, not selected anything at all, but simply endorsed, approved, ratified (or whatever else it may be called) two routes already captured by existing corporations. The report is really tantamount to a confession that the number of conflicting interests and opposing theories are so great that any system of rapid transit must really be taken in hand and carried out by private enterprise; and this conclusion is certainly experimentally proved by the fact that of the seven miles of "rapid transit" actually existing in this city (the Harlem improvement made by Vanderbilt and the Greenwich-Street road), every actual step forward has been taken by the "monopolists" who have had the matter in charge, the utmost done by the public

being to put the monopolists in motion and to supply in one case some of the funds. It is remarkable to observe that not even the contemplated "East-side" line is now an independent road, but it has joined forces or combined with the Greenwich-Street corporation.

On Tuesday the people of New Jersey voted on the constitutional amendments described in our last issue, and which, with barely an exception, deserved the support of every good citizen, and were in harmony with the spirit of reform which has nowhere of late so powerfully and hopefully manifested itself as in our State Constitutional Conventions. A body called the Catholic Union of New Jersey appealed to Catholic voters to vote against four of the proposed amendments whose importance will be recognized, namely: forbidding any town or county to give money or property or loan its credit in aid of, or own the stock or bonds of, any association or corporation; forbidding the State or any municipal organization to give land or appropriate money to any association; directing the legislature to provide for a thorough and efficient system of free schools; and forbidding special legislation in certain cases, as in granting to any corporation, association, or individual any exclusive privilege or franchise whatever, and again in providing for the public schools otherwise than by general laws. In accord with the Catholic Union, what was perhaps never before witnessed in New Jersey, prepared ballots were distributed in the Catholic churches last Sunday, with admonitions how to vote; and the Bishop of Newark went so far, on account of an amendment (otherwise objectionable) which threatened to make church property liable to taxation, as to recommend cancelling all the amendments. In fact, at many of the polls one saw Catholics distributing ballots which were entirely erased. As we write, the result of the election is not known. One result, however, cannot be doubtful. Whenever and wherever the religious issue is raised in this country by the priests, it will be taken up, and it will not be disposed of to their advantage. In the long run, they will gain no more in the United States than they lately did in Bavaria by interfering openly in politics.

Dr. Döllinger has been holding another of his conferences at Bonn with the view of uniting the English, Greek, and Old-Catholic churches. The attendance of delegates from the Greek and English Churches has been scanty, and they are by no means representative men. As regards the Old-Catholics, it suffices to say that they are supposed to number 20,000 in Prussia to 8,000,000 of common Catholics, so that their sayings or doings are not of great importance. As the London *Times* points out, too, the English clergy who have gone to Bonn to promote unity are mostly men who are quarrelling bitterly with their fellow-Christians of all denominations in the British Isles, and some of whom are not willing even for the sake of Christian peace to let a brother Christian call himself "reverend" on his daughter's tombstone. When the British Church is in this condition, the chances of union and harmony with men so far removed in feeling and tradition as the Greeks and Continental Catholics are but small. What Dr. Döllinger has accomplished by this last conference is to procure agreement among the delegates touching "the procession of the Holy Ghost," but this has been accomplished by the use of very vague language, and the careful and friendly abstinence of each delegate from letting any other delegate know his exact meaning. In the meantime, the learned and philosophical world, as well as simple people in Germany and elsewhere, begin to laugh at the Doctor and his efforts, and say that, as he has been a good Catholic all his life, and has swallowed everything but Papal Infallibility, he ought not to make such a fuss in his old age about swallowing this, and that he deserves no pity or sympathy—in which there is a painful amount of truth.

The draft of the New Spanish Constitution made by the Royal Commission has been published. It differs but little from an average French constitution. Besides the formal provisions, it forbids taxation except by parliamentary or municipal vote, and, while making the Catholic religion the religion of the state, allows freedom of worship to other denominations. The great test of a Continental constitution is, however, its mode of protecting the citizen against arbitrary arrest, and it is in this, if in anything, that one finds signs of improvement. The Spanish Constitution, like most of the others, forbids arrest except on a legal warrant or search, except under certain specified conditions, and requires that an accused person shall have a hearing before a magistrate within seventy-two hours of his arrest, which is all very well. But supposing he is arrested without a legal warrant, or detained beyond the legal limit without a hearing, he has no remedy but a petition, and if the petition receives no attention he cannot sue anybody, so that, in point of fact, no new guarantee for personal liberty is provided. In like manner, nobody's house may be unlawfully entered by the police, but, if the police do enter, the owner has no recourse except complaint, which might be, and judging from experience would be, barren, unless the Government was in a good humor. All public processions and "manifestations" are forbidden to Protestants, and it is feared that this last term may be so construed as to prevent announcements of religious meetings, or open-air preaching, or advertisements of religious books. Education is to be free, on compliance with legal rules as to competency, and so is the right to print and publish, and meet for discussion, but the exercise of these rights is to be regulated by legislation.

The Cortes is to be composed of a Senate and Chamber of Deputies. The Senate is to be composed of three classes of senators, of one hundred each: 1. Sons of the king, and grandees with $12,000 a year; generals of a certain rank; the admirals of the navy; the chief-justices of the courts; the archbishops. 2. Persons nominated for life by the crown from among those who have sat in eight legislatures, or been senators and cabinet ministers, or who hold a certain rank in the army or in the diplomatic service or judicial service, or are or have been presidents of the learned societies, and have $1,500 a year. 3. Persons elected by municipal corporations and leading taxpayers in the manner hereafter to be provided. There is to be one deputy in the lower House for every 50,000 of population. Porto Rico is to be represented, and Cuba when pacified. The draft has to be voted on by the Cortes which will be shortly elected, but by what constituency has still to be determined.

The insurrection in Herzegovina is clearly on the wane, if it be not already extinct, and has followed very nearly the course we ventured to anticipate—that is, its proportions were from the beginning greatly magnified by the Christians on the surrounding border, and it seems to have accomplished nothing beyond shutting up the Turkish garrison in Trebigne for a few weeks while reinforcements were coming, and making raids on the Mussulman villages, and throwing the Servians into a state of considerable excitement. But this excitement has been sternly kept in check by Austria, which does not want any disturbance, and it has stimulated the military efforts of the Turks, who have thrown heavy bodies of troops into the disturbed districts, and now march up and down where they please, and have relieved Trebigne. The remonstrances of the foreign powers have also produced promises of reform at Constantinople. Tribunals are to be set up in Herzegovina for the hearing and redressal of grievances, and there will probably now be a few months of reformatory activity, to be followed before long by more restlessness and other risings. The accounts from Belgrade seem to indicate that the Servian politicians and military men are getting it into their heads that the Principality may yet play the part towards the Slavonic regions of Turkey and Eastern Europe generally which Sardinia played towards Italy, or in other words may become the principal heir of "the sick man," and the growth of these pretensions has produced the curious effect of inclining the Greeks favorably to the Turks, and causing a Turkish alliance to be talked of at Athens. There could hardly be a better illustration of the subsidence which has come over Greek ambition after fifty years of buncombe.

## THE ONE-MAN POWER IN FINANCE.

THE tragic close of the career of Mr. Ralston, and the revelations which have been made about his relations to that great "developing" agent, the Bank of California, are leading people to reflect and talk a good deal about the dangers and temptations of the monarchical system of bank management. It has been remarked, and very truly, that almost invariably, when any great calamity overtakes a financial institution nowadays, it is discovered that, although the machinery of its government is thoroughly democratic, and although it appears to the outside world to be managed in the democratic way through a representative assembly, it has really been managed by one man, who alone had an intimate knowledge of its condition and alone wielded its resources. It is of course, in cases of break-down, usually discovered that he has committed great errors of judgment and has technically transcended his powers. We say technically, not really. His technical powers are defined in the charter and by-laws and resolutions of the board of directors; and these he is almost sure to overstep, but his real powers, be they great or small, are whatever the directors allow him to have, and they allow him to have whatever he chooses to take. If under these circumstances the concern collapses, it of course proves that it was his errors and shortcomings which have caused it. Whose else could they be? Either he has made excessive loans, or loans on insufficient security, or has borrowed money on a large scale himself, or has made bad investments. Most probably he has done all these, and the directors then try to escape popular odium by pleading the total neglect of their duties, and then there is a savage burst of indignation against them for not having known what was going on.

The truth seems to be, however, that all this is the natural product of the existing condition of business and society. The process which gave the Bank of California into Ralston's hands as if it were his private property, to deal with it as he saw fit, is one which is to be witnessed in lively operation in nearly every field of activity—in politics, for instance, no less than in finance. Affairs have become so complicated, the details of every undertaking of any magnitude so numerous, the contingencies on which success depends so subtle and delicate and so composite—that is, made up of so many minor contingencies—that the mastery of a large enterprise, and the ability to conduct it successfully, require a peculiar kind of talent, which does not increase in proportion to the increase of capital. The result is a growing tendency to mass capital, for the sake of getting the benefit of peculiar skill in the management of it. Part of this skill, and a large part of it, consists in the power of getting hold of details, and keeping them in one's head, ready for use whenever needed. Another and larger part consists in the possession of the quality called "judgment," which is also rare, and almost indefinable. It is the faculty which tells a man promptly what to do in a given state of facts, and enables him to do it with the utmost courage and confidence, without prolonged deliberation, or any elaborate process of reasoning. Anybody who has these qualities naturally makes his way to the front in all moneyed concerns, and naturally becomes president or cashier; and the directors trust him because they know he is abler than they are, and because, in nine cases out of ten, they would be incompetent to criticise his course. If they were competent to criticise it, they would be his equals; but they are not, and they know it, and they know that no statement he could make to them of what he proposed to do, and of his reasons for doing it, would make them wise enough really to supervise him. We see just the same tendency to the concentration of power in politics. The "management" there, as in finance, has become so complicated and laborious an affair that the men with the exceptional ability required by this kind of work have taken, or are taking, it wholly into their hands, and carry it on with comparatively little check. A public meeting, for instance (which was originally a democratic body), coming together for deliberation, is now a curious sham. Its opinions and resolves are all prepared for it by two or three men, who get up its indignation and aspirations in a private room. When a bank or trust company fails, as we have said, and the departure from theory in its management is laid bare to the world, there is a great outcry. But then there is no complaint made of the thousands of financial concerns which are prospering, or have not failed, and which are well known to be managed in just the same way. The reason is that people know there is no help for it. Boards of directors feel they are not equal to the task of looking after their president, or of questioning his decisions. It would be, as far as they are concerned, very like asking a prophet to prove his assertions. The manager would, in most important matters, be unable to justify his conclusions in words, because they are reached largely through bits of unconscious induction, based on experiences long ago recorded, but not clearly recalled in each transaction. The natural result of this supremacy is apt to be that he often gets into the way of doing not only high-handed things but wrong things. This is a common effect of untrammelled power on human nature.

Curiously enough, just as we are here experiencing the effects of the monarchical system, and calling for a change, they are beginning in England to complain of the democratic system, and are calling for a change in the other direction. The last number of the *Economist* contains an article denouncing, apropos of the heavy losses of the London banks by the late failures, the bad working of bank management through committees, especially now that the mass of money to be handled has become so large. "A very strong, skilled, decisive judgment," it says, "has to be applied to the minutiæ" "if the business is to be well conducted," and this cannot be forthcoming if the Manager [or President as we call him] is controlled by one committee of the directors for one thing, and by another for another thing, and cannot act independently at critical moments. "A board," it adds, "or even a committee of directors, is but an imperfect body in business of great detail; it is easily lost in an immense number of bills and figures; it is easily distracted and easily mistaken; and when it has made a mistake it cannot be punished, the responsibility is too divided." The editor, therefore, recommends the very thing we here are now crying out against, after having tried it pretty thoroughly—"a conspicuous chairman," "who could be removed when things went wrong, and who was highly paid for seeing that things went right, who was capable of really guiding the concern, and whom the public would know to be capable of guiding it;" but he takes it for granted that the directors would "watch him closely" and "retain the supreme authority in all great matters." It is safe to say that in this country at least, and we have no doubt the same is true of England, the directors could do nothing of the kind in the case of a highly capable man; that his success would throw them off their guard; and that, finding he made money rapidly, their vigilance would soon go to sleep, and the claims of their private affairs assert themselves, and their indolence overcome their fears or sense of duty. There seems at present little chance of substituting any system for the one into which we have fallen, and to which the English will doubtless eventually come, and the remedy for the misbehavior of our financial Napoleons must evidently be sought in a different direction, and the one which experience and analogy plainly suggest is increased publicity and accountability. We give to-day an enormous power over liberty and property to the judges of the superior courts, and we exempt them from all legal responsibility or supervision, except in cases of plain corruption. We exact from them one guarantee of honesty and capacity, and one only, but that seems on the whole to work perfectly well, viz., the obligation to give the reasons publicly for their decisions. There is really no more effective and salutary check on a man in any sphere of activity than the knowledge that on a certain day he will have to explain and defend his acts before the world, or before a competent body of critics. There is a suggestion in this which might certainly be made the basis of very great improvement in the management of banks, railroads, insurance companies, and other corporations, without depriving them of the advantages they now get from individual skill and energy. It ought to be easier to make presidents and other

dictators report and explain. Even if it would be impossible to prevent their doing things, it ought not to be impossible to compel a report of them and account for them after they have been done, and many "a Napoleon" would be restrained on the edge of a piece of recklessness, or it may be of crime, by the knowledge that he might at any moment have to clear up or defend his action. It is not the directors of our corporations only who are too helpless, but the stockholders. The facilities managers enjoy for keeping them in the dark furnish of themselves an enormous temptation to fraud and abuse, and in the case of railroads, one of the most potent of these is the privilege they have and cherish of keeping accounts in their own way, and charging things to whatever account best suits them. If we are to have legislation at all in aid of the better government of our great financial institutions, it ought to provide better machinery for enabling parties in interest to get at the facts; and this machinery should consist largely in the supply of formulas into which the desired information should be thrown, and these should be so simple that the most ignorant could understand them, and yet so minute as to leave little or no room for evasion or equivocation. The next great step in industrial and moral progress will undoubtedly be made in some such way. When a man like Ralston gets into the dreadful mess which resulted in his ruin the other day, the law is really more to blame than he. The duty of government and of society with regard to all money matters consists far more in the removal of temptation than the punishment of theft or peculation.

## THE NEW GERMAN POLITICAL ECONOMY.

M. LAVELEYE, the well-known Belgian economist, has in a recent article in the *Revue des Deux Mondes* given his countenance in a rather strong form to the doctrines of a new school of professional economists in Germany, called by themselves the "Historical School," and by their enemies the "Socialist School," and having Mr. Cliffe Leslie as their principal ally in England. This school, which is largely made up of professors in the universities, maintains that Adam Smith and his disciples, whom they contemptuously style "Manchesterthum," have made the mistake of trying to found a science deductively on a principle of human nature of their own invention, instead of inductively by the careful observation and registration of facts; and that, accordingly, their conclusions as to the operations of trade and industry are so inaccurate as to be worthless; that the only sound way of building up economical theories is by the investigation of the industrial history of each country; and that this work, in so far as it has been accomplished, shows that there is no universal political economy, with canons applicable to all countries and all races. Each country has, they say, on the contrary, and of right ought to have, a political economy of its own, provided, or at least regulated, by its Government, and suited to its history and necessities. The labors of the new school are producing, as might be expected from German habits, a considerable body of literature, and are throwing a good deal of light on obscure corners of social history, and so far cannot but prove useful as well as interesting. The value of such researches to the legislator can hardly be overestimated, not simply because they help to explain and often to justify many of the prejudices and idiosyncrasies with which he has to deal, but because they often furnish the results of experiments on some of the problems which this generation is called on to solve. A very useful illustration of the value of the historical method in political economy has in fact been recently furnished by the effect produced on English opinion with regard to the land question in Ireland and India by the labors of Sir Henry Maine and others. The Irish land legislation of Mr. Gladstone, just and beneficent as it has been, was undoubtedly largely the result of the light thus thrown on the origin of native Irish feeling and opinion with regard to land tenure, and we are likely to witness under the same influence a very valuable increase of tolerance and consideration in the dealings of the more civilized with the less civilized races all over the world. We are likely to see greater allowance made for prejudices, and more distinct recognition of the force of custom, and a diminished confidence in the possibility of providing the whole human race with governments on the same pattern.

The new German school is, however, by no means disposed to confine its pretensions within these modest bounds. It fancies it has made discoveries which must reduce Adam Smith and all his followers to comparative insignificance, and make worthless all economical interpretations and predictions based on the theory that the love of gain is the most powerful motive of human action. It flatters itself that it is about to bring about a revolution in our ideas on the leading economical subjects, and it has persuaded a good many people that we are hereafter going to give up the discussion of economical problems as problems common to all civilized countries, and approach each one from an English, or German, or French, or American point of view. That well-informed people may be influenced by it was illustrated by the fact that our *Financial and Commercial Chronicle*, for instance, was a few weeks ago reasoned into the belief by Dr. Roscher, one of the leading writers of the new school, that there is now going to be something new, peculiar, and distinctive in the economical development of France, Germany, and the United States respectively; that economical enquiries conducted on Whately's theory that man is an "exchanging animal," and that human society is largely influenced by pecuniary interest, are "barren and misguided as were the lucubrations of the schoolmen of the Middle Ages"; and that in this country, as in Germany, "the practical habits of the people demand a better method of investigating and reasoning upon economical facts"; and the *Chronicle* calls for "an investigation of man as he is, and not as he might be under some utopian economy of society, where he might be more free than we see him."

There are certain facts, however, which people, both here and elsewhere, who are impressed by the arguments of the German Historical School seem to overlook, but which, when reading Dr. Roscher and his colleagues, they would do well to bear in mind. The first, though not the principal one, is that one of the most marked features of German life down to the year 1866 was the complete separation of the intellectual class from politics, and indeed from all practical life, and the supreme indifference of the scholars and thinkers to governmental problems, and the scantiness of German speculation on questions of contemporary sociology. The result was that the outbreak of the war with Austria found some portions of Germany provided, it is true, with an extraordinarily effective system of administration, but under a system of government on the daily working of which public opinion, in our sense of the term, had little or no influence, and found its educated men looking on in childlike submission at the labors of a self-sufficient army and bureaucracy. Since the war, the professors have begun to turn their attention to politics with great vigor, but with very little of what we call "political sense," though with great faith in and reverence for the political machine which overcame the French. For useful and perspicacious comment on the existing social organization they are, however, as yet hardly qualified. For this some experience of public life as we understand it, or of the free working of social forces as seen in England or America, or even in France, is necessary, and this they have not had. Their ideal of the state has still a strong color of the camp about it, and acts of parliament and general orders are still too closely associated in their minds.

When, therefore, they began to turn their attention to political economy, it would have been safe to predict, *à priori*, that their speculations would be marked by extraordinary erudition—that is, that when they took a subject up they would explore it thoroughly through books, and that when they began to give opinions as to what ought to be done they would greatly magnify the responsibility of the Government and much underrate the capacity of the individual citizen; and this is exactly what has happened. They are furnishing us with exhaustive treatises, tracing the history of industry and property from the earliest ages down; and as they have nowhere found man industrially free or wholly governed by

selfishness, they smile scornfully at those who discuss him as if he *were* free, or who look forward to the time when he will be free. They have found him everywhere and in all ages tied up by one kind of restriction or another in the work of production or exchange, and they therefore assure us that we were foolish to suppose that he could ever produce or exchange without restriction, or that production or exchange could ever be profitably, in the highest sense of the word, carried on without a strong and constant state supervision.

Now, we are not going to defend all the positions taken by the non-interference school of political economists of the last fifty years, any more than we are going to defend all the positions of the physiologists or geologists or metaphysicians. Political economy, like other fields of enquiry, has had a good many doctrines pushed too far, a good many conclusions hastily drawn, and a good many disturbing agencies overlooked. But it is just as well to remember that the arguments used against the doctrine that man is a free agent, and that he is "an exchanging animal," or that gain is his ruling motive, might be used with considerable force against the existence of the first law of motion. The doctrine that a body once set in motion will move for ever in a straight line with uniform velocity is open to the objection that nobody has ever known a body to do anything of the kind. All bodies ever seen in motion by us move on crooked lines or stop after a short interval. It does not follow from this, however, that all speculation based on the theory that bodies would move in this way if let alone, is idle, or that in talking of the first law of motion we are talking of a "utopian state of things." To study mechanics is to study the various ways in which the law is counteracted; but it would be very foolish to argue from the multiplicity of the disturbing agencies that no such law existed.

Nor is it true to say that Adam Smith's political economy is a piece of pure deduction. On the contrary, the theory that man produced and exchanged best when let alone, and that the love of gain was the ruling motive of human conduct, was an induction, even in his day, from a vast mass of observed facts. Increased observation has strengthened and confirmed it. Those who are trying to persuade themselves of the contrary appear to forget that the history of civilization is in reality the history of the liberation of the race from a variety of arbitrary interferences with men's industrial activity. The acts of the savage, as the researches of the anthropologists have shown us, are regulated from morning till night by a mass of usages which have the force of law. As he rises in the scale, he becomes more and more free, and passes more and more under the dominion of his own sense of interest, as shaped by his reason and observation. The legislation of all modern countries runs steadily in this direction. We have not free trade as yet, but trade has been steadily growing freer. It is not in England only, but in France, in Germany, in Italy, and in the United States, in Russia, in India, that self-interest has been for the last hundred years gaining more and more control of the operations of industry. The notion of the German professors that they can arrest this tendency and remand merchants and manufacturers and journeymen to the tutelage of the state, is interesting as a psychological phenomenon, but it has no political importance.

There is one other question which students of Dr. Roscher and his colleagues would do well to ask themselves, and which, if candidly answered, will deprive their speculations, at least in this country, of most of their interest, and that is, What do they mean by "the State" when they are calling for more state regulation of trade and industry? If we may be allowed to apply the historical method to the professors themselves, we shall say that it is easy to see why *they* should suppose the Government is an omniscient and beneficent being, distinct and different from the community at large, and possessing stores of wisdom which the ordinary man cannot reach. That has been until now the theory of all good Germans. That the new school of political economists cannot as yet get it out of their heads is nothing wonderful. But that it will eventually get out of their heads, as well as out of the heads of all civilized men, is plain to be seen; and the more it disappears, the more fully Adam Smith will be justified. We know, as a matter of experience both here and in England, that the transfer of Mr. Boutwell, for instance, from storekeeping in Groton to the charge of the Treasury in Washington, did not in any way increase his insight, or render him better able to decide what business A. had better engage in, or in what way B. had better use his capital. We know, in short, by experience that a commercial people clamoring for a minute and constant supervision of trade and industry on the part of the state, would be clamoring for something which no training and experience would enable human nature as at present constituted to supply. There is not talent or capacity or knowledge enough in the world, and it is safe to say never will be, to furnish the kind of government which is necessary to keep Dr. Roscher's "political economy" in good working order. He must not suppose that, because we can get Bismarcks and Moltkes to make revolutions and win victories, the genius necessary to enable some people to manage other people's business better than they can manage it themselves, has been bestowed on man. As affairs grow more complicated, the commercial relations of nations and men more minute, and the workings of the machinery of business harder to follow, the sphere of individual discretion in the work of production and distribution must *necessarily* be enlarged; that of the state interference be restricted. It is not possible to draw a hard and fast line between them. The boundary has to be, and will always have to be, traced as the occasion arises by that invaluable quality called political sense, which is simply common sense mixed with a quick perception of what is or is not possible by legislation.

## FRENCH BIBLIOMANIA.

PARIS, Aug. 13, 1875.

A PHILOSOPHER once said that happiness consists in creating for yourself new manias as fast as you can satisfy them. One of the most expensive manias I know of is book-hunting; it is, however, the passion of some poor men, who contrive to do with art and knowledge what others do with capital. Book-hunting is practised to some extent in London, but I think it is nowhere as national a sport as in Paris. Go from the Pont Royal to the Pont Neuf, and from the Pont Neuf to the Pont Saint-Michel, and all along the banks of the river, on the stone walls of the quays, you will find a row of wooden boxes full of books and pamphlets. The *bouquinistes* are men without culture, dressed like workingmen, often in blouse (the blouse is the old national dress of the Gaul); they put marks on their boxes—50 centimes, 75 centimes, 80 centimes, one franc, one franc fifty; you seldom see any higher number.

Where do all these books come from? Every *bouquiniste*, besides his establishment on the quay, has in a back street some depot where books are kept; every day, almost, a "lot" is brought there; it is generally bought at auction, not at the great sales of books, but at the innumerable sales which take place in private houses forced sales, or sales after death. The bibliophile ignores these sales; he cannot wait till a lot of books is sold after beds, mattresses, furniture, etc., but the *bouquiniste* invariably buys the *lot* of books at these small sales; he hardly looks at the books; they are tied up in strings; he buys them by the weight, as it were, and brings them to his depot. In the depot the work of classification begins. Sometimes, in some small library of the *quartier* of Batignolles or of Belleville, or on the bookshelves of an old lady or a young spendthrift, a rare volume will get mixed with the trash of literature. A few choice volumes are picked out by the *bouquiniste* and reserved for the booksellers—he does not sell these directly to the public; the rest are taken to the quay, and as fast as the wooden boxes are emptied new books are thrown in. The book-hunter can only hope that the *bouquiniste*, who is a very ignorant man, has allowed something good to get mixed with the trash which covers the quay. You will see him start early in the morning (the early bird gets the worm) and peer eagerly into the boxes, which have just received their new cargo. And certainly some wonderful discoveries have been made in the despised boxes—original copies of Racine's, Molière's, or Corneille's plays. Each hunter has his own method; if he wishes to find the romantic poets of the modern age (this is quite the rage at present), the original editions of Musset, Victor Hugo, Lamartine, his eye will rest only on the unbound works, as these editions ought to be given to the binder with their margins quite uncut and virgin. If your taste should draw you to the original editions of the seventeenth century, you must pick up among all the books the very dirtiest, with

old calf bindings ; and if, on opening one of them, you should have the luck to see the name of Claude Barbin, make haste, throw your franc to the *bouquiniste*, and walk off without letting him know that you have found something valuable.

Book-hunting is an art. It requires patience, resignation, a mixture of instinct and knowledge. It is the resource of those lovers of literature who have small means. If you have a large balance at your banker's, you have nothing to do but to walk across the quay from the river side to the booksellers' shops. There you will find the game you are hunting, all cooked and ready ; the old calf binding has been replaced by a morocco binding of our great artists ; the old yellow leaves have been washed carefully, the missing page has been replaced, the torn frontispiece has been mended. There are, on the Quay Voltaire, some booksellers of the *vieille roche*, men of great knowledge, very honest, even if they like a good profit. They are a type : you can enter their shops, take a chair, converse with them ; they will show you all their treasures, and give you good advice about your researches, and will not be angry if you retire without having spent a franc. Of course, there are exceptions to the rule, but some of the Quay Voltaire booksellers are real gentlemen, owing perhaps to the atmosphere they perpetually breathe and to the quality of the men with whom they have to deal.

I could not say as much of a new class of men who have altered the character of the book-trade. They have abandoned the old headquarters of the bibliophiles, and opened gorgeous shops on the other side of the river, in the passages, and even on the boulevards. These splendid exhibitions of costly books have suddenly created a new public of book-hunters —rich bankers, club-men, even actresses of our great theatres, and, alas ! I am obliged to add that some of our extravagant Aspasias go into these places and buy at any price choice books with the arms of Madame de Pompadour, or Marie Antoinette, or the Comtesse de Verrue. An extraordinary inflation of prices has taken place for a certain kind of books, and an honest bibliophile is very much now in the position of an Englishman who sees his county hunted by a stranger while he can no longer give the price for a good hunter to carry him over the fences. Some great amateurs have been corrupted by the high price of books, and there is now a class of amateurs who in reality are nothing but speculators. They make, at a great expense, a fine collection, and then have a great sale, which attracts all the bibliophiles of the world. An old bibliophile, well known to all lovers of books in Paris—M. de Lignerolles—who is a *bonâ-fide* bibliophile, was offered some time ago a gigantic sum by an English bookseller for the whole of his library. He refused the offer ; and he was wise. An economist will tell you that everything must be subject to the law of supply and demand ; that books are a commodity like any other thing. The real bibliophile has a mystic affection for his books, especially those which he did not buy at some great sale or at some fashionable bookseller's. He loves the book which he has saved from destruction ; he found it poor, ragged, despised ; he washed and cleansed it, perhaps with his own hand, and confided it to one of those patient binders who spend one or two years in binding some great *chef-d'œuvre*. I once found the original copy in quarto of Corneille's 'Polyeucte,' bound in its first calf binding. I took it to my favorite binder, a man who does everything alone, in a third story of a small street behind the *Monnaie*. I showed him my jewel, and asked him how much time he would need. "Sir," said he, "give me at least a year ; this needs all my care." These binders are real types of artists ; they don't make fortunes ; they have as much conscience as their ancestors who made the famous Marguerite bindings, or the more modern Pasdeloup and others. But it is, perhaps, time to say : "Lugete, Veneres, Cupidinesque," now that our great booksellers have books bound by the hundred and the thousand. Fontaine, the great man of the Passage des Panoramas, publishes yearly catalogues which drive the old bibliophiles to despair ; there are in his last catalogue, for 1875, books of a value of a million francs. The binders are obliged to make great ateliers in their turn, and wholesale binding cannot be artistic.

One of the resources of the unfortunate bibliophile who now finds his old field invaded by so many Philistines, is the variableness of fashion, since the Philistine will follow the fashion, and does not know how to recognize the beautiful. Read, for instance, the three last yearly catalogues of Fontaine, which will be preserved as monuments of folly and extravagance ; you will find nothing but French books. Our Philistine does not know much Latin ; he cannot read Greek. You can buy now the old classics at an almost ridiculously low price ; the Latin Elzevirs are neglected, everybody will have the French Elzevirs. After a while, a classification is made even among these : your Philistine will have what he calls *amusing* books ; theology, morals, even history soon becomes distasteful to him. The number of desirable French Elzevirs becomes, consequently, more and more limited ; extravagant prices are given for a few volumes, while the quiet bibliophile buys the others cheap. But the furor of the day is the so-called *livres à figures*, the works of our *dessinateurs* and engravers of the second part of the eighteenth century. I will not disparage the merit of works which for a while have been too much despised, and which now are perhaps too much admired. I would not object to having in my library the 'Contes' of Lafontaine, the 'Baisers' and the 'Fables' of Dorat, the 'Chansons' of Laborde, Anacreon, Bion, Moschus, the 'Decamerone' of Gravelot, and a few others. Such a collection, especially if found in the old bindings, is a charming representation of the spirit of the dissolute and elegant eighteenth century. Nothing can exceed the *délicatesse* of some of the small works of Eisen, of Chaussard, of Marillier : "c'est peu de chose, mais c'est charmant," as we sometimes say in France. It is quite natural, it is even necessary, that such works should have a place in a French library ; the absurdity consists in excluding all the rest, in concentrating all literature and all art in this little microcosm. There is no reasoning with a maniac. I have known men who sold original pieces of Molière's in order to buy a stupid little Elzevir called the 'Pâtissier français' (worth 6,000 francs only on account of its great rarity). I have known others who got rid of their Bossuet and Fénelon, Rabelais or Montaigne, to buy the volumes in which the unreadable verses of Dorat are the ground on which lie the naked goddesses of Eisen.

The true bibliophile ought not to be a maniac : he must look everywhere, in every century, almost in every country, for what I call representative books—books which are the embodiment of the thoughts and, if possible, of the art of an age. I have in old Italian vellum the original edition of the 'Pastor fido' ; it would be an act of insanity if I should tear off the old respectable vellum, still white and pure, and cover the old leaves printed in Venice with a gorgeous red morocco Parisian binding. It is better to keep an old binding, if it has an artistic value, even if it is torn and defective, than to replace it with a new. Books ought not to be washed too much ; the glare of the pages whitened by chloride is not as pleasant to the eye as the yellowish tint of age.

The love of books is one which, once it has taken possession of a man, will never leave him : "un livre est un ami qui ne change jamais." The well-known books, which are, to a certain extent, your own creation, are mute friends, whom you can find at all times ; they advise you without scolding you ; they are teachers of patience, of resignation ; they take you out of the troubled current of life. America boasts of many magnificent public libraries ; he would be well inspired who should create, in one of her great cities, a choice library, a bibliophile's library, composed only of original works in historical bindings. Such a collection of jewels would serve as a model for your binders, for your printers, for your artists. The difficulty would probably not be in finding the large sum of money necessary for the creation of this philobiblion library, it would be in the choice of the works ; it could only be formed very slowly by a thorough amateur, well versed in all the secrets of bibliophilism, and with a sufficient amount of general knowledge to place him above the little manias of the day and to allow him to find in every literature the best *lettres de noblesse*.

# Correspondence.

## MR. ELLIOTT'S REPORT ON ALASKA.

To the Editor of The Nation :

Sir : In your issue of the 2d inst. appears a fair and able review of my report upon Alaska, but the reviewer has made, while pointing out, very properly, my own errors, one or two himself.

Congress, instead of appropriating "$20,000" for my work, gave but $10,000. Of this amount, nearly $6,000 lies in the Treasury to-day unexpended.

The assertion is not correct that I have relied "almost exclusively upon employees of the Alaska Commercial Co. for my data in regard to the condition of affairs," inasmuch as I have in my journal the names of twelve men to whom I am indebted for personal knowledge of the territory all the way down from Kotzebue Sound to Fort Simpson, who each and all have never been associated with the company in question ; and, furthermore, the fact that I have not cruised on the principal fishing-banks of the Territory did not prevent me from meeting fishermen who have done so in the harbors of Victoria, Sitka, Port Townsend, and San Francisco.

I do not cast any reflection upon "clergymen and school-teachers" when I express the opinion that their labor up there would result in discord

and mischief; for if they were zealous and honest, it surely would. Certain natural surroundings, wanting there, are indispensable to the success of such labor.

I call the Aleuts and Kodiakers a decidedly distinct race, because they are the only natives of the Territory that have fixed abodes and live in a semi-civilized manner. I do not use the term with ethnological significance, for my report has nothing to do with that; only this distinction, so great, does exist, and hence, should any legislation ever be adopted for Alaska, it should be steadily kept in view.

The sales of Alaska raw seal-skins last year averaged $10 to $12 each, not "58–75s." The Shetland catch sales, however, bring this high figure, which my reviewer has charged to the skins of Alaska, the fur being superior. The market, however, fluctuates greatly; in 1868–69, these skins from the Prybilov Islands sold for $3 and $4 each, and during the last years of the Russian occupation they were selling in the best market of the world as low as $2 80 each, and only two years ago the Alaska Commercial Co. sold thousands of its skins at $5 per pelt.

The Icelanders who have just returned from a whole season's experience on the very best ground of the Territory refused to speak of the agricultural worth of that region, and when it is borne in mind that they stated that the soil could not be touched or broken until the 10th of last June, etc., etc., the reason for their silence becomes apparent, because the truth would seriously conflict with the report made so hastily by their comrade last fall. I myself think that the Icelanders could live better in Alaska than they do at home, but that does not imply that by so doing they will ever be able to add one iota to the sum of our national wealth and prosperity. I think it would be a great deal wiser if their attention was directed to Puget Sound, where the summers are cool and equable and the winters quite mild. Here they can fish, hunt, and cultivate the soil, ship as sailors or work in logging-camps, and, above all, find schools for their children—a future there which the rigorous climatic conditions of Alaska deny. Very truly yours, HENRY W. ELLIOTT.

SMITHSONIAN INSTITUTION, WASHINGTON, Sept. 3, 1875.

## GUILIELMUS OR WILHELMUS?

TO THE EDITOR OF THE NATION:

SIR: In your number 506 a critic, speaking of the Latin form of Mr. Gladstone's name, asks: "Is not his first name *Gulielmus?*" I was brought up to *Gulielmus*. Our college Williams always found themselves under that disguise in the triennial catalogue. But one of the Chaucer Society's publications which has just reached me is a copy of the court-roll in the case of a robbery of Chaucer—one of the late finds in the Record Office. It is in the best law Latin, and the name *William* occurs in it several times, always as *Wilhelmus*. Rummaging into the old Anglo-Saxon Chronicle and the later chronicles, I find they also have *Wilhelmus*. Dipping into a German book or two, I find Steinthal addresses himself *ad Wilhelmum De Humboldt*, and I light on *Wilhelmus Grimmius* and other *Wilhelmi*, and an occasional *Guilhelmus*.

*Wilhelmus* we know about. It is *Wilhelm* (he whose *will* is for the *helmet*) with a Latin ending. It is an odd barbarism, for the Romans of the classic period had no such letter as *W*, but represented the sound of our *w* by their *v*. The later Romans had changed the sound of *v*, and when a character was wanted to represent the *w* of the Germans, *vv*, *w* was invented, and so we have *Wilhelmus* for *Vilhelmus*. The French found *w* hard to pronounce, and changed it to *gu—werra war* to *guerre*, *wile* to *guille guile*, *Wilhelm*, in old French sometimes *Villalme*, to *Guillaume*, and so we get *Guillelmus*, a barbarism of the second degree; and that has somehow, I suppose, given birth to *Gulielmus*, a barbarism of the third degree. But when, where, how did it come to be proper English Latin? Has it ever come to be authoritative outside of college catalogues? If Professor W. D. Whitney or Professor W. Everett were to spell his first name in Latin after Mr. Weller's famous direction to his son, would it be contempt of court? F. A. M.

[Just where to draw the line in Latinizing modern names has always been a matter of taste, and consequently a matter of some dispute. We smile at the combined simplicity and pedantry of the sixteenth century, when the main object seemed to be to disguise the original name as much as possible. Plain Davus may guess a Kämmerer under Camerarius, a Müller under Molitor, a Holtzmann under Xylander. But to know that Bucretius stands for Rindfleisch, Ladomus for Steinhäuser, and Oecolampadius for Hausschein, requires an Œdipus. The strongest instance of change is that of Reuchlin, who first altered Reuchlin into Räuchlein (little smoke), and then through καπνίον and καπνιῶν into Capnio. Modern Latinists are inclined to give family names and names of places in the real form, and without a Latin suffix. This is convenient and perhaps the only feasible way to do in lists of names like those in college catalogues. But such names in connected discourse appear sometimes very ludicrous. We remember reading on a tombstone an epitaph, otherwise unexceptionable, which said: "Natus est in oppido cui nomen est Kennebunk." As to the matter alluded to by our correspondent, in the caption "Augustus M. Toplady et W. E. Gladstone," we inferred, perhaps not unnaturally, that the W was an oversight for G. The difficulty would have been avoided if the name had been printed in full—Wilhelmus E. Gladstone. Certainly we should be far from saying that William or Wilhelm—of which name Förstemann in his 'Deutsches Namenbuch' gives over thirty different spellings—*might* not be Latinized Wilhelmus. But this brings in the letter W, a letter unavoidable, to be sure, in family names, but awkward even there; and while Guilielmus or Guilelmus (if we said or were made to say Gulielmus in No. 506 it was an oversight), may not boast of a very long or legitimate pedigree, it has the recommendation of looking somewhat more like Latin than Wilhelmus, and it is sanctioned "outside of college catalogues" by such authority as Ruhnken, Ritschl, and Fleckeisen.—ED. NATION.]

## LINCOLN'S GETTYSBURG ADDRESS.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of August 20 is an enquiry for the manuscript of President Lincoln's Address at Gettysburg.

Mr. Lincoln arrived in Gettysburg in the afternoon of the 18th of November, 1863, and was a guest of one of our citizens—Judge Wills. He was called out in the evening to reply to a serenade, and at a late hour went to his room. Sending for his host, he enquired the order of the exercises of the next day, and began to put in writing what he called some "stray thoughts" to utter on the morrow. When delivered, they were read from an official letter-sheet. It is uncertain whether *this* manuscript has been preserved.

But when Mr. Lincoln was asked, in April, 1864, to send to the Baltimore (Md.) Fair for the relief of soldiers and sailors an autograph manuscript, he sent a copy of his Gettysburg Address, which, lithographed, is to be found on pages 3, 4, and 5 of 'Autograph Leaves of our Country's Authors' (Baltimore: Cushings & Bailey. 1864). Every word is written with distinctness and care; and there is no room for mistaking even a letter or a punctuation-point. This is, undoubtedly, the final form he gave the Address, and is that by which he intended it should be judged. I enclose an exact copy. Very respectfully,

EDWARD MCPHERSON.

GETTYSBURG, PA., Aug. 31, 1875.

*"Address delivered at the dedication of the Cemetery at Gettysburg.*

"Fourscore and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal.

"Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We have come to dedicate a portion of that field, as a final resting-place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

"But, in a larger sense, we cannot dedicate—we cannot consecrate—we cannot hallow—this ground. The brave men, living and dead, who struggled here, have consecrated it, far above our poor power to add or detract. The world will little note, nor long remember what we say here, but it can never forget what they did here. It is for us the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth. ABRAHAM LINCOLN.

"NOVEMBER 19, 1863."

# Notes.

MACMILLAN & CO. have in press a work on 'The Russian Power,' by Ashton Dilke; a 'Life of Sir James (Rajah) Brocke,' compiled chiefly from his letters and journals from 1830 to 1868; a complete edition of Christina Rossetti's poems; and a revised and extended library edition, in three volumes, of Green's 'Short History of the English People.'——Charles Desilver & Sons, Philadelphia, announce Sanderson's 'Biography of the Signers to the Declaration of Independence' (originally published in 1820), revised and edited by Judge Robert T. Conrad.——J. B. Lippincott & Co. will shortly publish 'The Amazon and Madeira Rivers,' by Franz Keller; a treatise on punctuation by Prof. Joseph A. Turner; and 'Florida, its Poetry and its Prose,' by Sidney Lanier.——Those of our readers who were interested in our late review of Pattison's 'Life of Isaac Casaubon' may like to hear of a tasteful reprint of this theologian's answer to Cardinal Perron, the old English translation of which bears date of 1612, and is so rare that the copy from which this reprint was made is thought to be the only one in the United States. We owe its publication to Messrs. W. R. Whittingham and Hall Harrison, who see in it "Anglican Catholicity defended against Roman innovations" with a force and authority which leave nothing to be desired. They have prefixed to it a short account of Casaubon, and King James's Confession of Faith. (Baltimore: Turnbull Bros.; New York: D. Appleton & Co.)——B. Westermann & Co. send us parts 27 and 28 of Stieler's Hand-Atlas, whose contents we have already noted. Maps 13 and 14 together show the whole of the Mediterranean basin. Subscribers who are about to bind this work may be thankful to Westermann & Co. for a hint to fold each map in the middle and back the fold with a linen guard. This reduces its size one-half, and makes the term "hand-atlas" seem less of a misnomer. The same suggestion applies to 'Spruner's Historical Atlas for Mediæval and Modern History,' of which we have received from Justus Perthes Part 12, containing: Germany from the Peace of Westphalia to 1742; France, 1461–1610; the British Colonial Possessions since 1783; and the Eastern Roman Empire from the immigration of the Hungarians into Pannonia (A.D. 895) to 1019, etc. Among the valuable side-maps are plans of Paris, Berlin, Vienna, etc., at different periods.——Mr. Charles Lanman, for his contribution to the Centennial, has prepared and will shortly issue a work entitled 'Biographical Annals of the Civil Government of the United States during its First Century.' It is to contain about 7,000 biographical sketches, besides 8,000 names of persons who have been connected with the Government since the signing of the Declaration of Independence. The work can hardly fail to be valuable.——Robert Clarke & Co. now formally announce Chaplain T. B. Van Horne's 'History of the Army of the Cumberland' for publication in December next. It will consist of two volumes and an atlas, the campaign and battle maps being compiled by Edward Ruger, of the Topographical Engineer Office, Department of the Cumberland.

—Our recent remarks on the various versions of Lincoln's Gettysburg address have attracted some attention, and we print above an authoritative letter in regard to it from Mr. Edward McPherson, Clerk of the House of Representatives. The Boston *Advertiser* brings out the fact that Mr. Charles Hale, formerly the editor of that paper, made a long-hand report of the address as delivered, which was afterwards printed in a Massachusetts Senate document. Mr. Hale attended the dedication of the cemetery as one of three State commissioners, and sat on the platform within a few feet of the President. His report preserves the abstract term "government of the people," omits "poor" before "power," and in other respects generally agrees with the popular version. Mr. Lincoln's original manuscript, the *Advertiser* has been informed, was once seen in the possession of a Boston gentleman residing in Canada, but now deceased. We suppose this is open to doubt. The *Advertiser* also quotes from Bartlett, what we had overlooked, part of a speech of Theodore Parker's in 1850, in which the phrase "a government of all the people, by all the people, for all the people" occurs as a definition of democracy. Mr. Lincoln was not unfamiliar with Mr. Parker's writings, and it is just possible that he met with and remembered this phrase.

—There is a passage in the 'Frogs' of Aristophanes which possesses some interest at this juncture, both for the Scholar in Politics, the Soft-Money Man, and the Ungrammatical Plain Man. The law of currency which prevents two kinds of money, one of greater intrinsic value than the other, from circulating together, is now so familiar that one has some difficulty in understanding how people should ever have been ignorant of it, and yet all through the Middle Ages, and down to the time of Queen Elizabeth, nobody seems to have been aware of its existence. When a government, therefore, issued a quantity of adulterated coin, they were constantly surprised and provoked to find that, as soon as it appeared, all money of greater value vanished. They used, however, to think, as some of us think now when our foolish legislation does not work well, that the reason it vanished was that "bad men" collected it and carried it away out of sheer wickedness, or, as the old indictments used to say, "being moved thereto by the instigation of the devil." In Elizabeth's reign, however, Sir Thomas Gresham discovered the seat of the trouble, and reported to the Queen that the *cause* of the disappearance of good money was the coining of bad money. The phenomenon had been perceived, though not accounted for, long before. Aristophanes, in the 'Frogs,' draws attention to the fact that the Athenians made no longer any use of their good old pure coin, but used the coin adulterated with brass, for the first time in Athenian history, in the archonship of Antigenes, and he makes use of an analogy which suggests a law of politics of which we hope we may not some day have to acknowledge the existence also, viz., that it is not possible to make the two moral and social extremes of society work together in politics—Charles Francis Adams, for instance, and John Morrissey. The passage is the following:

"Often, to us at least, the city seems to be in the same condition with respect to its best and most upright citizens as to its old money and new gold; for of the former, which is far from being adulterated, nay, the purest of all coinage, the only ones correctly stamped, and proved by ringing everywhere among Greeks and foreigners, we make no use whatever; but we do of the latter, bad and alloyed with brass as they are, struck but yesterday from the very worst of dies. And of the citizens, those whom we know to be respectable, prudent, and just men, and really good characters, and educated in gymnastics, choruses, and music, we treat with indignity; but the brazen mob, foreigners, slaves, rascals, and sons of rascals, we employ for every purpose, though the very newest comers, fellows whom the city before now would not, without scruple, have used as scapegoats."

We wish the Springfield *Republican* would write a smart, spicy, breezy, newsy article on this passage, giving us the Ungrammatical Plain Man's view of it.

—A reader of the *Nation* sends us the following extract from Fowle's *New Hampshire Gazette* for May 20, 1785. A correspondent, whose wisdom was only a little in advance of the inflationists' of May, 1875, after rehearsing the ills under which the people of the State were groaning—the heavy taxes, unprofitable trade, bad men in and seeking office, bloated bondholders, etc.—and stating that "petitions have been preferred for the issuing a bank of paper money," but without result, proceeds in this wise:

"Let manly and firm remonstrances be presented to the General Court representing the distresses of the country through want of a currency as a medium of trade, and that while other States are making paper money, whereby their inhabitants are relieved and their trade flourishing, we, who are (comparatively speaking) infinitely in greater want of money, have no chance of being indulged, while there are men suffered to remain in power who are basking themselves in the sunshine of lucrative places, and cannot feel for others, through a callosity of heart which makes them insensible to any one's interest but their own. Instruct your representatives to vote for the making a paper currency, and to pledge themselves in behalf of their constituents for the support of its credit; and let laws be made *enacting banishment* to those who shall dare to refuse or depreciate it, as unworthy the name of fellow-citizens. Let *censors* be appointed in every town to observe who are so daring as to counteract the wisdom of the legislature, and bring them to their condign punishment."

—We spoke in these columns some weeks since of Mr. Frank Duveneck and the portraits from his hand exhibited at the Boston Art Club. These have been followed by three more, visible during the last month at the rooms of Messrs. Doll & Richards. We expressed some doubts as to whether further acquaintance with what Mr. Duveneck had done would confirm the very high opinion we had formed of his talent, but these doubts have been wholly removed. Two, at least, of the three pictures in question are superior to any of the half-dozen exhibited in the spring. One of them is a head of an old man with a fur-cap, a large, bony, and sanguinary nose, and a mangy-looking scrap of beard—a forlorn, grotesque personage, very strikingly rendered. This picture is skilful and forcible, but it differs less appreciably in kind from ordinary clever work than its companions. These are extremely remarkable. One is a full face of a young man in a broad, black hat—an Italian, we believe, and fellow-student, in Munich, of the artist—painted with admirable richness and solidity. Mr. Duveneck is altogether masterly in his combination of breadth of handling with complete preservation of the essence of his subject. His painting gives us, so to speak, the excitement of adventure and the certitude of repose. The third picture is a half-length of a lady in a brown dress and

scarf, and a white cambric hat, holding a fan, with the body in profile and the face three-quarters full. This was the first female subject by Mr. Duveneck we had seen, and it is quite the finest of his portraits; this, too, in spite of the fact that only the face is finished. This face strikes us as a very considerable achievement. The consummate expressiveness of the eyes, the magnificent rendering of flush and bloom, warmth and relief, pulpy, blood-tinted, carnal substance in the cheeks and brow, are something of which a more famous master than Mr. Duveneck might be proud. The figure is, moreover, full of movement, spirit, and style; its lightest touches tell of a talent which has excellent reason for self-confidence. Mr. Duveneck is essentially a portraitist; it is hard to imagine a more discriminating realism, a more impressive rendering of the special, individual countenance. That analogy with Velasquez, proportions considered, of which we formerly spoke, strikes us afresh in the works to which we now allude. It is not too much to say that in the portrait of the lady it is, in a very noble sense, deceptive.

—We cannot forbear speaking on this same occasion of a very fine portrait by Copley, now also visible at the establishment of Messrs. Doll & Richards. Copley at his best is an admirable painter, and this picture of Mrs. Spinner, painted in Boston almost exactly a hundred years since, was certainly unsurpassable by the artist himself. The lady leans her elbows on a small polished mahogany tea-stand; one hand holds a blue flower, the other, with the fingers extended, supports one of her temples. She is in full dress, with a great deal of admirably painted lace at her bosom and on her sleeves, and her pale blond hair is rolled over an immense cushion. She is not beautiful, and one of the sources of interest of the picture is its intimation that the bloodless, nervous, attenuated type of American woman was not more exceptional among our great-grandmothers than among our wives and sisters. Copley's model in this case—her stately apparel apart—looks as if she might have stepped out of a Boston street-car. The color of the picture has turned somewhat sallow with time, but its essential characteristics as a first-class piece of portraiture have not been damaged. For direct, exact reality, Copley almost ranks with the very first, and such a portrait as this satisfies us in so many ways that we are almost puzzled to say what else we demand. When a head is so definite and solid and living as this, we are tempted to believe that it is all it can be. We finally perceive, however, that it can be a little more graceful and a little more suggestive. Even in so happy a performance as the portrait of Mrs. Spinner, Copley remains a trifle hard and rigid; here and there his surfaces are more like carving than painting. As for suggestiveness, he rendered perfectly and exhaustively all that he saw, and he saw nothing that he could not render. He was definite, as we say; but that adventurous vision of the indefinite which has brushed with its wing all the very greatest works of art is never reflected here. Copley was by no means a Holbein, but he holds a very honorable place in the ranks over which Holbein presided as supreme genius. We have called attention to the portrait of Mrs. Spinner because, in these days of complex aims and half-successes, there is something extremely refreshing in the spectacle of a simple aim begetting an absolute triumph.

—As Wyoming is the only spot on this continent where women are allowed to vote, the friends of woman suffrage have naturally made the most of the experiment, and have from time to time given us glowing reports of its success from very respectable local authorities. A correspondent of the Cincinnati *Commercial* has lately been making a tour of observation in the Territory, and his account of what he saw there appears to be unprejudiced and truthful. He does good service at the outset by restoring the perspective which our Eastern suffragists have unconsciously distorted. Should the experience of Wyoming count for much either for or against woman suffrage? The Territory is twice as large as Pennsylvania, yet has a population only half that of an average county in Ohio, and no greater than that say of Springfield in the same State. Over such a thinly-settled area the forms and the force of law can prevail only in the immediate neighborhood of the leading towns and the Sweetwater Mining District. Moreover, the women eligible as voters do not exceed 1,500 in a population of 18,000, being as one to ten adult males. This disproportion shows how little influence the women who actually vote can be expected to have, either for good or for evil, at present; but it is also to be borne in mind that all the higher officers of the Territorial government are appointed at Washington; and, finally, it is susceptible of very exact calculation that the number of public prostitutes in the Territory is fully one-fifth of the whole number of legal female voters. The actual results may be briefly summed up. One woman has been elected superintendent of public instruction, another appointed justice of the peace, and that is all. "No woman has been chosen or nominated for delegate, councilman, representative, police judge, or to any clerical office." Even with the women, men are preferred as candidates. There is, however, better order at the polls than formerly, the ladies usually riding there in carriages and being very respectfully treated. Those of them who have to be urged to vote cost the candidate wishing their support a heavy outlay for carriage-hire, and as this has come to be regarded as an evil the ladies have recently resolved in convention to walk to the polls hereafter. The prostitutes do not vote in a body or with any organization, and are divided much like any other class. While soldiers and officers cannot vote, their wives and the regimental laundresses can, after a long enough residence. In the courts there was at first an important change, and much was hoped from the presence of women on grand and petit juries. But the practical working of this service speedily revealed such obstacles, peculiar to the sex of the new jurors, that women have quietly been dropped from the panels and are not likely to be enrolled again for a long time. Exemptions for moral, physical, and temporary domestic reasons left only the perfectly healthy unmarried women, or childless mothers, or the mothers of grown-up children. "There is not," says the *Commercial's* correspondent, "one unmarried woman in a hundred who would sit on a jury if she could help it, and in this country not more than one criminal case in ten is fit for an unmarried woman to hear. My informant says there are less than two hundred ladies in all Wyoming who are at once eligible and fit for jury duty." That the foregoing conditions could lead to no marked social revolution is obvious. The correspondent quotes as his own conclusion that of an old resident of Cheyenne: "Woman suffrage in Wyoming has resulted in making everything just as it was before, only a little more so."

—We print on the next page a review of 'Les Armées Françaises et Etrangères.' Since it was written much new light has been thrown on the subject by a writer in the August number of *Blackwood*, who has been enabled to collect his facts by means of personal enquiry. He represents the present state of the French army as far from satisfactory. He admits that the reforms indicated in our review are well imagined; that individually officers are working as they have never worked before, and that the majority of them keenly feel that they must labor long and patiently if they ever hope to wipe out the humiliation of defeat. He admits, too, that the new plan of fortifications is excellent, that the new rifle is a good one, and that the system of complete *corps d'armée* is wise and practical. But if his estimate is to be trusted—and, aside from the absence of contradiction and the strong confirmation given by the Paris correspondent of the London *Times*, we have every reason to believe that it should be—the old prejudices and abuses still exist at the War Office, and render any radical reform for the present utterly hopeless. The system of "*virements*" from one chapter of the budget to another is largely practised. All the men paid for are not in the service; the vital problem as to the Staff Corps and Intendance remains unsolved; the entire administration is wretched, and has caused France to "waver and bungle" over the work of military reform in the most astonishing manner. These criticisms remain unanswered, and they are doubtless just. The root of the evil is deemed to be the unfitness for his position of the Minister of War, General de Cissey. He is, as the late war proved, an excellent commander in the field, and the writer in *Blackwood* respects him as an "honest man" and a "straight and valiant soldier," who came to the War Office with a sincere desire to do away with the old errors, but soon became entangled in the meshes of red-tape, and at length was completely vanquished by his bureaux. Napoleon the Third said that the French army was like a beautiful and complicated machine, whose several parts were separated. This comparison is more striking now than ever before. The pieces of the machinery have doubtless been greatly improved, the strong and skilled hand that can put together and arrange the disunited parts is alone wanting. To the absence of strong initiating genius and high moral courage at the War Office the writer in *Blackwood* attributes the present weakness of the army. It would be madness for France to think of going to war before twenty years, and by that time it seems likely that the generals of the old school will have disappeared. Should a supreme head be given to the army while the work of individual improvement continues, we do not see that France need despair of her military future. Depending upon this contingency, the view taken in the article which appeared in *Fraser's Magazine* a few months ago, and was written, we think, by an officer lately of Sir Garnet Wolseley's staff, seems a not unreasonable one. We hope that the writer in *Blackwood* has made use of his rare opportunities on the 3d of September. On that day the whole of the passed reserve men of 1867, except such as are allotted to the 16th and 18th corps, for whom a later date is fixed, were summoned to report for one of the two annual trainings under the decree of 1872.

This will test the ability of the War Office to make the men on the rolls appear under the colors, and should throw light upon the worth or reality of the French system of reserve.

## THE NEW ARMY OF FRANCE.*

SIX years ago, and how many French officers were there who even thought of honestly comparing armies of other countries with their own; who were ready to confess that professional knowledge was to be obtained on the other side of the Rhine; or who looked upon the soldiers of Prussia other than as "well-organized militia totally inadequate for offensive purposes"? Surely they could easily have been counted on one's fingers. The patriotic efforts of the Duc d'Aumale and Changarnier were attributed to partisan and unworthy motives. The grave warning of Stoffel was not only disregarded, but that officer himself was viewed in the highest quarters with no little distrust; and, to quote an able critic, "De Failly feasted daily upon twelve courses served on gold plate, while Trochu languished on half-pay."

Success doubtless tends to close the eyes of the victor to imperfections of detail, tactical errors, and, above all, to individual faults. The traditions of France were glorious; and had she not been victorious in the Crimea and in Italy? Had not her army reached the pinnacle of perfection? To the military observer instigated by a purely scientific love for the truth, the shortcomings in those campaigns were most painfully apparent. The systems of administration and mobilization were particularly faulty, and the greatest sacrifices had to be made to keep the regiments up to anything like their proper numerical strength. And yet—aside from improved armament and the paper organization of the "Garde Mobile"—no improvement had been even attempted until the last war. Prussia, too, had conquered Austria. "We committed many errors during the campaign of 1866, and we felt the necessity of amelioration in many details," said more than one Prussian general officer. Wrote the author of the famous 'Tactical Restrospect': "If our cavalry should think that their powers in the campaign of 1866 were the highest that they are capable of, they may prepare to sing their own funeral dirge."† Prominent among the reforms which this war gave birth to is the now celebrated department of the "Etappen-Inspektion," which enabled the Prussian staff, with such marvellous facility, not only to transport the German army into France, but also the standing army of France into Germany, to keep open the regular mail and telegraphic communication with the most distant detachment, and—with the exception of a load of wounded French prisoners who had become frozen in some cattle-cars on their way to Germany, and had to be chopped out with hatchets on their arrival—reduced the sufferings of the wounded and sick to a minimum never before realized in warfare.

Twice—during the "Seven Years'" and the "Seven Weeks'" Wars—had the soldierly virtues and disciplined energy of Prussia amazed the world. Not until the third time, however, do the French insert in their text-book a leaf from Berlin. The younger officers of the army—aroused and purified by unheard-of disasters—examine themselves with a keen and impartial criticism. They were the first to insert the scalpel in the wound and bring to light abuses, errors, and time-honored failings. Unceasing study was deemed a powerful factor in the military and social reorganization. That the fruit of this industry might be enjoyed by all, a professional association became needful; and in the month of July, 1872, the "Reunion of Officers," already inaugurated by Major Fix, of the Staff Corps, was established officially by General de Cissey and Admiral de Pothuau, the Ministers of War and Marine. "The development among officers of habits of study and application in all forms and by every attainable method," is the chief object. The headquarters is at the Central Bureau in Paris, and there are forty-eight branch establishments throughout France, each provided with a suitable library, maps, and models. Upwards of two thousand officers of all grades are included in the list of active members. The management is conducted by a committee of thirty-five officers, chosen by ballot, who represent every arm of the service. Facilities for the instruction of officers of the "territorial army" are provided, and courses in the Russian and German language are prescribed. Already the members have published 128 essays, 98 pamphlets, and 32 volumes of from 160 to 800 pages, many of which have reached a third edition, and a bulletin is issued weekly by the society, in which the contributions of the members are published.

The volume before us is merely a summary of the principal articles which have appeared during the year in this bulletin. The chapters which most interest us are those treating of the renovation of the French army. France to-day is very ill-prepared for war. For offensive purposes, she has not more than 200,000 troops available. But her system is in process of transformation. The Prussian model has been followed so far as is consistent with the traditions and temperament of her people. Compulsory military service has been established, and enforced with such rigor as to yield an annual contingent of about 150,000 men. Each man is liable to serve for five years with the active army, but owing to financial reasons this term was reduced during the past year to little more than twelve months for the infantry. After this actual or constructive service of five years, they pass into the reserve for four years, and may at a moment's notice be recalled to the active army. After this they constitute the first division of the second reserve for another five years, when they pass into the second division of the second reserve, in which body they remain enrolled for six years longer. With a few trifling exceptions, every able-bodied Frenchman is thus, on attaining his twentieth year, held to a term of twenty years' military service. By the continuous operation of this law, the maximum military strength will be reached in the year 1895. In that year, due allowance being made for the decrease of population, death, and accidents, it has been estimated that France will have at her disposal the enormous total of 2,500,000 thoroughly disciplined and skilled soldiers—men whose physical or moral inferiority to the Prussians, for instance, will be atoned for by a longer term of military instruction.

Another important innovation is the creation of the nineteen permanent army corps. Each is a carefully-fashioned military unit, whose chief, in matters of administration as well as of the command of troops, is vested with almost absolute power, untrammelled by the former vicious system of centralization. General and staff officers will thus become identified with their commands, and brigades and regiments have confidence in their neighbors. This, moreover, will greatly aid in mobilizing the forces, for, as our readers are aware, the permanently organized Prussian army corps were not the least important element in conducing to the rapidity with which the army was placed upon the Rhine frontier in 1870, with no more waste than is required to put a chronometer in motion, and which more than half won the victory for Germany before a shot had been fired. It ought soon to be possible for printed time-tables of the order of march to be kept on hand by the French staff, which would only require the insertion of the day of the month and a signature to mobilize the entire army.

The French "non-local" plan of recruitment is deemed better in some respects than the German "local" system; for, while compatible with rapidity of mobilization, it saves the more impressionable French soldier harmless from the home and sectional political influence so prejudicial to military discipline. A French army corps will contain in the same regiment, or company, men taken at random from republican, royal, or imperial districts, whereas those German army corps which are composed almost entirely of Roman Catholics might, in certain quarrels, prove no mean test for even Prussian discipline.

Much has doubtless been done, yet much more remains to be accomplished. Reform of so radical a nature must be brought about slowly, and each day has its task. The above instances, however, would seem to evidence the seriousness with which the military reformation is undertaken. In view of this, the law now proposed in Germany, if enacted, will enable the Emperor to oppose to the 2,500,000 French soldiers of 1895 2,800,000 Germans; while Russia—so soon as her laws of compulsory service shall have attained their full vigor—will have at her disposal the unheard-of host of 3,000,000.

From among the shorter essays we would direct attention to the one upon "Cavalry." It is a mooted question at present whether or no this arm still has a rôle to play upon the battle-field. Cavalry is as important as ever in the warfare of the future, but its functions are different. During the last war there were scarcely more than two instances of the traditional use of cavalry upon the field of battle: the desperate and fatal assault made by Michel's Cuirassiers upon the Vth Army Corps at Woerth, and the superb charges of Bredow's brigade and the 1st and 2d Dragoons of the Prussian Guard at Mars-la-Tour—both cases where one arm of the service must be sacrificed to save one of the others; and this, in our opinion, is the sole excuse for the employment of cavalry upon the actual field of battle. The services rendered by the German cavalry away from the field of battle, on the other hand, have been with justice highly praised. It constituted an impenetrable veil, behind which the rapid combinations of the German armies were effected in perfect secresy. It was, in a great measure, owing to the German cavalry that Bazaine, kept in utter ignorance of the where-

* 'Publication de la Réunion des Officiers (quatrième année). Les Armées françaises et étrangères en 1874. Principaux Evénements militaires et maritimes, Notices et Documents statistiques, Renseignements divers, etc.' Paris: Librairie Hachette et Cie.; New York: F. W. Christern.

† The writer of this treatise, which appeared anonymously and attracted so much attention at the time, was Captain May, late of the Prussian 44th Regiment, who was killed during Goeben's winter campaign in the north of France.

abouts of the enemy, delayed about Metz when he should have been far on his way westward. It was the manœuvring of the cavalry of the Prince of Saxony which led the French staff to report the main body of the German army to be at Montmédy when, in truth, not a foot-soldier had crossed the Meuse ; and cavalry, penetrating the French lines, brought information of the demoralized state of De Failly's corps, which led to the surprise at Beaumont. But, advancing into the interior of France, it became necessary to give more consistency to the cavalry by the addition of battalions of riflemen, who were transported in wagons obtained in the country. As events proved, but for this device the free movements of the cavalry divisions would have been neutralized by partisan infantry and *francs-tireurs*, who lay in wait behind every covert. The clearing of the country south of Paris and the success of Manteuffel in the north were largely due to this scheme, improvised to meet a stage in the war for which the Germans were not prepared. Had they possessed large bodies of mounted infantry, most effective service might have been rendered in preventing the formation, or at least intercepting the supplies, of the armies of Bourbaki, Faidherbe, and Chanzy. And there is very high authority for the statement that had the French, early in the war, devoted their energies to the creation of efficient bodies of horsemen like the so-called cavalry of Sheridan and Wilson, they might have so impaired the German lines of communication as to have rendered the continuous investment of Paris highly improbable if not impossible. The result is that the prediction of Marshal Marmont seems about to be realized : the future "cavalry" of Europe is to be armed with the short rifle, and become accustomed to fight when required on foot, as did the dragoons of the sixteenth and seventeenth centuries, and the mounted infantry of the American civil war.

The papers relating to fortifications and artillery go to show that the improvements in this direction keep pace with those in the other branches of the service. Enormous appropriations have been made for the new defences of Paris, which are to enclose a very much larger extent of territory than heretofore. The batteries of field-artillery are to be provided with breech-loading pieces made of steel ; and the experiments and conflicting theories of foreign governments in regard to siege and garrison artillery are studied as carefully as possible, although little has been actually done, and a single battalion of Chasseurs only is armed with the new Gras rifle. The narrative of the struggles which have now for more than three years enabled Don Carlos to hold ground against the Spanish army of the North, commanded successively by no less than twelve generals-in-chief, merits the attention of those who desire more than a superficial knowledge of that war. There is also an account of the war in Sumatra, which includes the failure of the first expedition under General Kohler, which was forced to retreat with the loss of its commander, and the final establishment of the Dutch in Atchin by General Van Swieten with an army of 14,000 men.

The annual publication of the 'Reunion of Officers' provides a ready means of keeping one's self conversant with military progress in Europe, and will be particularly acceptable to those—like many of the officers of the army of the United States—who may not always be able to procure the numerous treatises and pamphlets which appear almost daily on the Continent. The volume before us, moreover, has interest as being the exponent of the spirit of the younger officers in France ; and it is impossible for us to close it without feeling that the blow for the lost province—deferred for a score of years perhaps—will certainly at some future day be struck.

## GERMAN DARWINISM.*

A FEW months ago, in answer to the enquiries of a correspondent about books on evolution, we took occasion to point out and emphasize a division, very fundamental and important in our view, in books on this subject, namely, between those which treat of it as a theorem of natural history from a Baconian or scientific point of view, either mainly or exclusively (confining themselves to scientific considerations of proof), and those which treat of evolution as a philosophical thesis deductively, and as a part of a system of metaphysics. Such a division separates the names of Darwin and Spencer (which are popularly so often pronounced together) as widely as any two names could be separated on real grounds of distinction.

Two little books have lately been published by Messrs. Appleton & Co. in their 'International Scientific Series,' which we may add to the short lists we gave of popular works on evolution—one to each list. Professor Oscar Schmidt's 'Descent and Darwinism' is essentially a scientific treatise, though of a type which could hardly have been produced originally in the English language or from a Baconian standpoint, and for English students of science. Of its peculiarities we propose to speak further on. The second book belongs to the speculative or metaphysical branch of the subject, and consists of two essays : one, translated from the French of Dr. Cazelles, is an account of Mr. Spencer's philosophy, and a comparison of it with M. Comte's ; the other essay is a lecture by Dr. Youmans, given in defence of Mr. Spencer's claims to the credit of establishing the doctrine of evolution. Dr. Cazelles's essay is an interesting account of Mr. Spencer's theories by a fair-minded disciple—by as fair-minded a disciple as one could well be who is at all disposed to yield not merely to claims on one's assent for the sake of argument or system, but on one's adhesion to undemonstrated beliefs asserted to be axiomatic and irresistible. But a *system* like Mr. Spencer's is obliged to stand on such positions. To us it is inconceivable (and therefore, according to one of Mr. Spencer's criteria, opposed to truth) that any one should not resent at every step the asserted demonstrations which Mr. Spencer parades. Neither Dr. Cazelles nor Dr. Youmans begins, however, far enough back in their accounts of the origin and progress of Mr. Spencer's thoughts. These were really theological in origin, and have never departed from the theological standpoint. For it is one thing to arrive at solutions of problems different from those commonly held, or from the orthodox, and quite another thing to outgrow or be drawn by legitimate studies aside from the problems themselves. Believers in philosophies of the unknowable are very much in the state of mind towards the theological problems of their earlier years in which the converted savage is towards the powers and attributes of the idols, which his reason has come to pronounce no other in fact than common blocks or stones. Presenting evidence to this effect does not really diminish the savage's practical belief that his idols are pre-eminently ugly or awful, and preternaturally, though unapparently, unphenomenally, great. To get rid of this belief he must destroy the really harmless blocks. To have believed strongly without due evidence is a state of mind not easily convertible, when due evidence is seen to be wanting, into a state of mind to which the object is absolutely without existence, but is more commonly changed into one in which the old interest remains and the object still affects the believer as an unconditioned, unproved, undemonstrable, but not less pragmatically real existence ; and this is the real starting-point of Mr. Spencer's philosophy.

Dr. Cazelles thinks that Mr. Spencer "freed his theory from all metaphysical attachments" when he came in the course of his thought to dismiss the moral or teleological implication of the word "progress," and substituted the word "evolution" as the more appropriate name for the abstraction which he sought to define as the fundamental idea of the universe ; and when he also substituted in his formula of definition the word "integration" for the "individuation" which he first thought to be the true form or idea of progress. The theory was doubtless thus freed from attachment to any received form of speculation on the nature of life and being, but not at all freed from the scope and method of metaphysics—this scope being systematic omniscience, including even the unknowable. The method of metaphysics is to treat of detached abstractions—that is, abstractions without check in definition and precision from the concrete examples and embodiments to which Plato, not less than Bacon, pointed as indispensable guides to clearness and truth. There is no profound difficulty in conceiving what progress means, if we qualify the question by the consideration of the concretes in which progress is made ; not even if we extend our enquiry to the vague ranking of organisms as higher and lower. The essential error of metaphysics, or "realism," is not merely in attributing to an abstraction a truly individual, thing-like existence, or making it a "realized abstraction," but in *treating it as if* it had such an existence—in other words, *as if* it had a meaning independently of the things which ought to determine the true limits and precision of its meaning. Thus, to apply the mechanical law of the conservation of force, which, as a scientific truth, has no meaning beyond the nature and conditions of material movements (whether these are within or outside of an organism)—to apply this law analogically to all sorts of changes—to the "movements" of society, for example—is, in effect, metaphysics, and strips the law of all the merits of truth it has in the minds and judgments of physical philosophers, or of those through whose experimental and mathematical researches it came to have the clear, distinct, precise, though technical meanings in science that constitute its only real merits. The daring ignorance which in this speculation undertook to change the name of the principle, to call it "persistence of force," supposing the word "force" to refer to an incognizable substratum of causation, and not, as it really does in science, to various measurably interchangeable forms of material movement and antecedent conditions of

* 'The Doctrine of Descent and Darwinism. By Oscar Schmidt, Professor in the University of Strassburg.' New York: D. Appleton & Co. 1875.
'Outline of the Evolution-Philosophy. By Dr. M. E. Cazelles. Translated from the French by the Rev. O. B. Frothingham. With an Appendix by E. L. Youmans, M.D.' New York: D. Appleton & Co. 1875.

movement (wholly phenomenal), gave the author's use of the principle the character pre-eminently of metaphysics. We remember, as its most characteristic feature, this attempt in his 'First Principles' to eke out his barren "system" of abstractions by wresting and corrupting the very type of unmetaphysical scientific truth to the vagueness of a principle of the "unknowable." The principle of the "conservation of force" does refer, indeed, to what thus appeared to be hopelessly unknowable to such a mind—namely, to the experimental and mathematical measures which determine its real meaning and proof. The climax of the speculation was capped when this principle was declared to be an undemonstrable but irresistible axiom—what we cannot help believing when we have once conceived it!

In the same way, "evolution" is, with Mr. Spencer, not a theorem of inductive science, but a necessary truth deduced from axioms; and nothing can be more mistaken, therefore, than Dr. Youmans's defence of Spencer's claim to credit for substantiating a doctrine also, unfortunately, called "evolution"—the doctrine of the origin of species by "descent, with modification," which is wholly due to the labors of leading English and German naturalists—real workers in experimental science. Dr. Youmans, unfortunately for his defence, quotes (p. 125) Spencer's acknowledgment that, though in 1852, or earlier, he had conceived of the principle of "the survival of the fittest," he had not conceived of it as producing the *diversities* of living beings, or conceived of the co-operation of natural selection with indefinite variations to produce species. But this last is the whole gist of the matter, so far as mere conception is concerned; and the merit—though this is a small part of Darwin's merit in the matter—of this conception belongs so completely to him and to Mr. Wallace that the half-glimpses of the conception by earlier writers are of small account. Even Aristotle had conceived of the cause now called natural selection, in one of its modes of action; and two English writers—Dr. Wells and Mr. Patrick Matthew—in 1813 and 1831, set forth the agency of this cause in more extended but still limited forms, the latter coming very near to the views of Darwin and Wallace. So far as other elements of the doctrine of descent ought to go to any single thinker's credit, they undoubtedly belong to Lamarck, to whom, at the beginning of this century, and not to Mr. Spencer, the following introductory remark by Dr. Youmans is justly applicable—namely, that while the idea of evolution "was passing through what may be called its stage of execration, there was no hesitancy in according to him all the infamy of its paternity; but when infamy is to be changed to honor, by a kind of perverse consistency of injustice, there turns out to be a good deal less alacrity in making the revised award." In applying this remark to Mr. Spencer, as to a long-tried martyr, Dr. Youmans is himself guilty of the very injustice towards Lamarck of which he complains in behalf of Spencer; for there is nothing in Spencer's writing relating to what is really honored by men of science (namely, the scientific explanation of the origin of species) that is not to be credited either to Lamarck or to Darwin. This honor is really awarded to the scientific proofs and arguments on the subject, to which many other naturalists besides these more eminent ones, and especially those of Germany, have materially added by their contributions of observation and criticism; so that the theory as it now stands, which the sketch by Professor Schmidt sets forth very lucidly, is really a scientific theory only, and bears no necessary relation to any "system" of philosophy. It is worth noticing here that this sketch, though treating the subject historically, and canvassing the merits of various contributions to it in this century and the last, in Germany, France, and England, nowhere mentions the name or fame of Mr. Herbert Spencer.

But in Germany, where the theory first got the name of Darwinism, it is much more of an "ism," or connects itself much more intimately with general philosophical views, than in England or America, except where in these countries it has got confounded with Mr. Spencer's speculations. It is to the significance of this fact—the character of Darwinism in Germany—that we wished especially in this review to call attention, as an interesting phenomenon in the history of modern speculation, determining the true place and the essential influence of Bacon and the Baconian philosophy. German systematic historians of philosophy were never able to make out where to place Bacon's so-called philosophy, or indeed to discover that he had a philosophy, or, what has appeared to their minds as the same thing, a "system." And indeed he had no system: but by marshalling the forces of criticism known to his time, and reinforced by his own keen invention, against all systems, past and prospective, he aimed at establishing for science a position of neutrality, and at the same time of independent respectability, between the two hostile schools of the Dogmatics and the Empiricists, though leaning towards the tenets of theology just so far as these had practical force and value. He thus secured the true status for the advancement of experimental science, or of experimental philosophy, as it came to be called. He had less need of doing, and deserves less credit for what is more commonly credited to him—namely, laying down the rules of scientific pursuit, which the progress of science has itself much more fully determined. But what could be more fit as a criticism of such a "system" as Mr. Spencer's than these aphorisms from the first book of the 'Novum Organum'?

"Some men become attached to particular sciences and contemplations, either from supposing themselves the authors and inventors of them or from having bestowed the greatest pains upon such subjects, and thus become most habituated to them. If men of this description apply themselves to philosophy and contemplations of a universal nature, they wrest and corrupt them by their preconceived fancies, of which Aristotle affords us a signal instance, who made his natural philosophy completely subservient to his logic, and thus rendered it little more than useless and disputatious. The chemists, again [those of Bacon's time], have formed a fanciful philosophy from a few experiments of the furnace. Gilbert, too [a contemporary of Bacon's], having employed himself most assiduously in the consideration of the magnet, immediately established a system of philosophy to coincide with his favorite pursuit."

And again:

"In general, men take for the groundwork of their philosophy either too much from a few topics or too little from many; in either case, their philosophy is founded on too narrow a basis of experiment and natural history, and decides on too scanty grounds; for the theoretic philosopher seizes various common circumstances by experiment, without reducing them to certainty or examining and frequently considering them, and relies for the rest upon meditation and the activity of his wit."

Under the Baconian régime the physical sciences have flourished in Great Britain for more than two centuries; while "philosophy," as it is known in Germany, both orthodox and heterodox, has dwindled, except so far as it has had practical holds and bearings on one side through theology in religious teachings, or has been reinforced from time to time on both sides from the Continent. In Germany the position of the experimental sciences was far otherwise until near the beginning of this century. The sun of Baconism has not even yet shone fully on the German mind, or except as reflected from the position which the sciences have so long held in Great Britain and France, as compared to the claims of any systems of philosophy. That such a system as Oken's *Naturphilosophie*, with its vague and meaningless abstractions, was an influence at the beginning of the present century, is not however so surprising as perhaps it would be if Mr. Spencer's system (bearing a much greater resemblance to it than to any theories of Darwin), had not got such a footing with English-thinking readers as it appears to have. There is, however, at present in Germany an ascetic school of experimental and inductive science, which deprives itself of the aid and guidance of theoretical and deductive considerations, in order the more effectually to protect itself from their undue influence. These *Gelehrten* are not true Baconians; but their method might be appropriately named "experimentalism." Men of science in Germany have in general never considered themselves as in a respectable neutral position with reference to opposite systems of philosophy, and Professor Schmidt in his preface accordingly consents to the cry from both sides in philosophy, "Avow your colors"; and proceeds in his introduction to define his standpoint sharply on several subjects which cultivated English liberal thinkers would consider as irrelevant to the theme of his book—*e. g.*, against "dualism" in vital phenomena, against miracles and other metaphysical positions.

Nothing could be more in keeping, on the other hand, with the refinement of modern English Baconism than the manner in which Darwin presents the doctrine of descent in his 'Origin of Species'; and as his scientific enquiry did not touch upon the origin of life itself—but only on the origin of its various forms and their relations to one another and to their surroundings, he even took a pleasure—a poetical, not a dogmatic one, surely—in presenting in religious language his sense of the scientific mystery of life, speaking of "life with its several powers having been originally breathed by the Creator into a few forms or into one," etc. Upon this often-quoted passage our author prosily remarks that "in this Darwin has certainly been untrue to himself, and it satisfies neither those who believe in the continuous work of creation by a personal God, nor the partisans of natural evolution." We doubt if Darwin cared to satisfy any but those who are willing to mark the boundary by a slight difference of style in speaking of the two; between what is evident or probable on experimental grounds, and what as yet baffles all approaches of experimental enquiry. It is a little incongruous that one so pre-eminently cautious and painstaking, so little speculative or metaphysical in the range of his researches, should be hailed as chief by so large a constituency of what really amounts to a philosophical school; albeit they are the brightest minds of Germany, and pre-eminently men of science. Professor Schmidt's book is in form, however, and in effect,

a thorough and learned scientific treatise, though it takes grounds, as the earlier French disciples of Newton did, on matters extraneous to his scientific subject.

## THE WARS OF THE ROSES.*

NO period is more dreary and few more worthy of attention than the epoch which is treated of by Mr. Gairdner. That the Wars of the Roses are marked by a peculiar impress of dreariness will be admitted by all students. A struggle which deluged England with blood was carried on by men who did not care to pretend that they had any public interest at heart. The actors in this savage and sterile contest were not marked by greatness or genius. Edward the Fourth was a man of ability, and Richard the Third has left a permanent impression on popular imagination, owing to the singular wickedness of his career; but amongst all the nobles who fought and intrigued, now for the House of Lancaster and now for that of York, there is not to be found a single leader of statesmanlike ability. A master of rhetorical fiction has attempted to make a hero out of the King-maker, but the attempt was a failure; and the Warwick of history appears to have been a less remarkable man than the Warwick who poses and declaims in the character of the Last of the Barons. Mr. Gairdner himself is painfully aware that the era of which he is the historian was wanting in greatness. "The XVth century," he writes, "was not in reality an age of great men. Amid schism in the church, wars, rebellions, and disputed successions in every kingdom of Europe, it seems to have been impossible for any mind to realize to itself one grand idea, to work out one grand work, or to set forth one great thought." This uninteresting epoch deserves, nevertheless, careful consideration, and the defect of Mr. Gairdner's succinct and clear narrative is that it does not bring into clear relief the points which make the Wars of the Roses, if not interesting, yet noteworthy. In the capacity for seizing on the really important features of an age, he falls infinitely below Mr. Seebohm and Mr. Samuel Gardiner, each of whom has handled the epochs which fell to their lot with masterly skill. No doubt the struggles of the Houses of Lancaster and York cannot compare for dramatic effect or intrinsic importance with the era of the Protestant Reformation or with the period of the Thirty Years' War; still, Mr. Gairdner might have taken example by his predecessors, and have directed the minds of students not so much to minute details not worth recollecting, and certain to be forgotten, as to the important features of the age which forms the link between mediæval and modern history. A few pages of Mr. Green's admirable 'History of the English People' throw more light on the Wars of the Roses than does the whole of Mr. Gairdner's meritorious manual.

To one most important question Mr. Gairdner gives no answer whatever. Did the long contest cause great suffering to the mass of the people? One's first impression is that the country must have been reduced to ruin. A glance at the map of the war provided by Mr. Gairdner shows that England was dotted all over with battle-fields, and a cursory perusal of the history of the times shows that from the death of Henry V. to the battle of Bosworth an almost unceasing series of wars, of conspiracies, of revolutions, and of battles must have deprived the nation of order, rest, and peace. Nor can any one doubt that both the French wars and the civil contests which preceded them must have wearied and exhausted the mass of the people. It may, however, be suspected that the Wars of the Roses caused less damage to the nation than most struggles of anything like their duration. There is no trace in Mr. Gairdner's account of the want and famine which, even more than the slaughter of battle, wore down the French peasantry during the hundred years' war with England. There is no mention of that terrible depopulation which the Thirty Years' War inflicted on parts of Germany. Nor do the social and political institutions of the country seem to have been deeply affected by the contests in which one noble family after another lost their lives and property. The judicial circuits, it is said, still went their course. No attempt was made by powerful noblemen to assert independence of the crown. Warwick made and unmade kings, but he did not attempt, like the nobles of France, to render himself independent of the crown. The battles were, especially towards the later period of the wars, scenes of savage carnage; but this carnage fell mainly on the combatants. The towns were able to protect themselves. No great city was sacked. Both parties were anxious for the favor of the city of London, and the growing influence of traders and merchants is a sufficient proof that their wealth was, in spite of tumults and battles, constantly on the increase.

The country districts no doubt suffered, yet it is difficult to be certain what was the extent of their suffering. In one respect, at any rate, the mass of the country people must have made progress. The rebellions of Wat Tyler and of Jack Cade are an evidence of their misery, but the cessation of such revolutionary movements must be taken as some proof that the evils which gave rise to them were abated. It is certainly curious that a period of disturbance did not lead to violent movements on the part of the peasantry, and it is certainly worth notice, in connection with this fact, that by the time of the accession of the Tudors villenage seems nearly to have come to an end. What were the causes which enabled the mass of the people to make considerable progress during an age of disorder, is an enquiry of great difficulty; but whoever will turn away his mind from the mere horrors of the battle-field, and the tragedies in which kings and nobles were actors, and consider how immediately, on the restoration of order, the people began to flourish, will be inclined to believe that the Wars of the Roses did not entail unbearable sufferings on the mass of the people. The administrative machinery constructed by the sagacity and vigor of the great Norman and Plantagenet kings was no doubt disarranged, but it was not broken to pieces. Even during the continuance of the civil wars citizens and peasants suffered less from misgovernment than did at the same period the peasants of France or Germany; and when the field of Bosworth closed the era of strife, the mass of the people must have found in the destruction of the nobility considerable compensation for the horrors of a war which had been caused by the reckless selfishness of the feudal nobles.

The rise of the mercantile classes is closely connected with the one permanent and important result of a sterile conflict which came to an end simply because the forces of the combatants were utterly exhausted. This result was the foundation of what Mr. Green happily termed the "new monarchy." Whoever lost by the civil war, the power of the crown gained by it. What the mass of the people desired above all things was peace and order, and this a stronger ruler alone was able to give. Edward IV. had the sagacity to perceive that the interest of the crown coincided with the interest of the trading classes, and, perceiving this fact, laid the foundation of that scheme of government which was carried to its highest point by his grandson, Henry VIII. Modern constitutional writers see in the growth of the royal power simply an encroachment upon the liberties of the people; but a people who have been oppressed by the vexatious lawlessness of a feudal aristocracy find in the increased power of the crown not a diminution of freedom, but the commencement of a rule of law. That at a later stage of progress royal power is inconsistent with the existence of freedom and legal order is true; but it is also true that you must establish the rule of law before you can base upon it free institutions or constitutional government, that when Henry VII. came to the throne the one crying want of the nation was orderly government, and that the middle classes showed both sagacity and patriotism in supporting the powers of the crown. Modern romance combined with ecclesiastical sentiment has thrown a halo around feudalism; but the most important lesson of the Wars of the Roses is that feudalism almost of necessity led to war and disorder, and that at the end of the fifteenth century the necessity of the day was to put an end to disorder, and enable the mass of the people to live and prosper under the rule of law. This fact explains the feeling of loyalty to the crown which prevailed during the whole reign of the Tudors, and was with difficulty destroyed by the folly and tyranny of the Stuarts. The strength of this sentiment lay in the fact that under the Tudors, and especially under Henry VIII. and Elizabeth, to support the crown was to support the law, and hence, by an inevitable association of ideas, the feeling of personal loyalty to the king became associated and identified with the respect for the law. The overthrow of the monarchy or the diminution of the royal power opened to statesmen and people alike a vista not of rational liberty, but of renewed anarchy. As long as the memory of the Wars of the Roses survived, so long national sentiment supported the power of the crown. Much may be said with full justice of the defects of Mr. Froude's history. It has, however, the merit of calling attention to the fact that the statesmen of the sixteenth century were influenced by a constant fear lest any mischance should give rise to new wars of succession. To understand and appreciate this feeling, it is necessary to study the Wars of the Roses which gave it birth.

* 'The Houses of Lancaster and York, with the Conquest and Loss of France. By James Gairdner.' London: Longmans; New York: Scribner.

*Cobden Club Essays:* Local Government and Taxation. Edited by J. W. Probyn. (New York: Cassell, Petter & Galpin. 1875. 8vo, pp. 454.)—Centralization is probably the most powerful tendency of the present day, both political and social. Our Federal Government overrides the authority of the States: Hanover and Hesse are annexed to Prussia; small farms are absorbed in great estates, and small workshops in great manufactories; farms are deserted for villages, villages for large towns, and large towns for great cities; the rich are becoming richer, and the poor poorer. There

is a favorable side to this tendency, or it would not exist; nevertheless, like all tendencies, if not balanced by counteracting tendencies, it threatens evil to society. Like all tendencies, again, it carries with itself the seeds of its own eventual defeat. Some time the pendulum will swing in the opposite direction; meanwhile, it behooves us to foster whatever healthy counteracting tendencies we possess. Chief among these, in a political point of view, is local self-government. Whether found in the so-called sovereign States of our Union, or in the vestry of an English parish, this is eminently a characteristic of Anglo-Saxon liberty. We inherited this inestimable possession, and with good reason cling to it as a chief corner-stone of our institutions. Other nations, however, have some vestiges or germs of it, and it is a praiseworthy enterprise of the Cobden Club to present in one volume a summary of these. It will serve at once as a study in comparative politics, and an aid in controlling or moderating the movements of society.

The communities treated of in this volume are England, Scotland, Ireland, Australia and New Zealand, Belgium and Holland, France, Russia, Spain, and Germany; other nations are omitted for want of space, but the hope is expressed—in which readers will surely concur—that there may be opportunities for them in a future volume. The most important essays are those upon England, by Mr. Brodrick, and Germany, by Mr. Morier—the same who wrote the essay on Germany in the Cobden Club essays upon land-tenure. Those upon Belgium and Holland, by M. de Laveleye, and upon Russia, by Mr. Wentworth Dilke, will also be found very instructive; every article, indeed, contains valuable information, well arranged for reference. Village government in Russia, closely connected with the village-community system, or *Mir*, presents some very interesting features. All heads of families, women included, take part in the village assembly, and questions are hardly ever decided by majorities: "If the parties disagree in a matter, it is talked over and over again, the meeting is adjourned, and the village in the meantime talks it over once more, quietly; and at the next meeting, when the question again arises, some compromise is generally arrived at, or the minority, seeing their position, withdraw. . . . The peasants would never think of voting one by one for the candidates for various positions; the names are talked over before the meeting begins, and when a name is mentioned the meeting shows its feeling by a few words, and he is chosen or not" (p. 317). Mr. Calhoun would have been delighted with "this hatred of the mere brute power of a majority." Unfortunately, the system of local government organized after the emancipation of the serfs has failed—not through the fault of the peasants, our author insists, but partly through injudicious regulations, and partly, it would seem, from the jealousy of the higher classes.

Mr. Morier's essay, like that in the former volume, contains an admirable historical sketch of local government in Germany; its fault, indeed, is that this is disproportioned to the rest of the essay. An historical sketch is certainly necessary for understanding the present state of things, but it hardly seems necessary to have entered so minutely into Frankish and mediæval institutions—giving, for example, a pretty full abstract of Sohm's work upon the early constitution. So well informed as Mr. Morier is, we are surprised to meet with the old statement of the 60,000 knights' fees of William the Conqueror—a statement completely exploded (see Stubbs's 'Const. Hist.,' Vol. I., p. 431). Apart from its disproportionateness, this essay is very serviceable. We do not know where else in the English language there is to be found so complete and succinct an account of the now prevailing views as to the early Germanic constitution.

Mr. Brodrick, too, has an excellent historical introduction, much briefer than Mr. Morier's—to be sure, it is more generally familiar ground. Here again we wish he had given his authority for considering (p. 4) 1,200 acres as the property entitling a person to "a *status* in the class of the landed aristocracy" of the Anglo-Saxons—that is, as a thegn. The amount stated is five hides, which may be reckoned as 600, 800, or 1,000 acres, or several other sums, but not, we think, 1,200. Probably the writer had in mind the term "twelve hynd-man," but this refers not to the property but to the wergild of the thegn, 1,200 shillings (not 600, as Mr. Brodrick says); see Stubbs, page 161.

The chief value of this essay, however, is in the remarkably clear and intelligible account which it contains of the present local organization of England—county, poor-law union, parish; sanitary district; borough and city; improvement commissions and local boards:

"The average size of a county . . . . would be represented by a square about thirty-three miles to a side, or a circle of eighteen miles radius. The superintendence of areas so extensive must often involve long and expensive railway journeys as well as familiarity with a great mass of details, and will naturally devolve either upon highly-paid officials, or upon gentlemen of ample means and leisure. The average size of the union would be represented by a square of nearly ten miles to a side, or by a circle of about five miles and a half radius. Such an area, wholly comprising a small town in its immediate neighborhood, may easily be traversed on horseback or in a carriage, without the aid of railways, and most of its administrative business can be arranged so as to suit the convenience of farmers and tradespeople resorting weekly to the same market. The average size of a parish would be represented by a square of two miles to a side, or by a circle of little more than one mile radius, so that every part of it can be visited on foot, and the parish officer, knowing every family within it, can discharge most of his duties with no great sacrifice of time or labor" (p. 31).

All these divisions, as well as the boroughs, possess genuine life, he says; "but there is no real life in the institutions of parliamentary or lieutenancy divisions of county, and very little real life in those of petty-sessional divisions or highway districts, which may be altered to suit the convenience of magistrates without much disturbance of other local arrangements" (p. 74). So in this country there is real life in State, county, town, but none whatever in Congressional or legislative districts, which, nevertheless, are usually taken for practical arrangements—no doubt because of their uniformity of size.

We will close with an instructive passage in relation to New England institutions:

"It is a curious and instructive fact that, while the primitive ideal of self-government had thus become obscured both in English counties and in English boroughs, it not only survived but acquired a fresh vitality in the colonies of New England. . . The New England 'towns' were nothing but a reproduction of Anglo-Saxon 'townships,' with a larger average area, and with a better-defined corporate identity. . . . Like the townships of Old England, the New England towns were held responsible for their own roads, bridges, and police; but, in accordance with more recent principles of English policy, they were also held responsible for their own poor-relief and education. The example of England doubtless suggested the delegation of jurisdiction to magistrates, instead of the popular assemblies; but a novel precedent of evil augury was set by making these magistracies elective [what does this refer to?]" (p. 25).

We will observe that Mr. Brodrick holds correctly, as we think, Stubbs's view (p. 82) of the political character of the English township, while Mr. Morier (p. 427) follows Sohm in denying all *public* character to the township.

HENRY HOLT & CO.'S
SCHOOL-BOOKS

include, among others, Freeman's Historical Course, the Class-room Taine, Siglar's English Exercises, the Ord. Series of Classics, Whitney's German Course, Otto's French and German Courses, etc. Reference is made to the faculties of all leading institutions. Catalogues sent on application. Address

*A CLASS FOR YOUNG GENTLEMEN,* and private instruction. Circulars sent on application. THOS. R. ASH, 17 East Sixteenth Street, New York.

*ALLEN'S ACADEMY.—An English, Classical,* and Polytechnic School. IRA W. ALLEN, LL.D., President, 737 Michigan Avenue, Chicago.

*AMERICAN COLLEGE OF ORATORY,* Elocution, Pulpit Oratory, Dramatic Art, Vocal Culture, etc. Ten Professors; each a distinct Department. Connected with

THE GRAND CONSERVATORY OF MUSIC,
No. 112 Fifth Avenue, New York.

*ANDALUSIA HALL, Andalusia, Pa.* (*near* Phila.) A good, thorough Home School for Boys.

*AT THE JAMESBURG (N. J.) INSTI-* tute each boy has the special care he needs. Address M. OAKEY, A.M., Principal.

*BALTIMORE.—All Saints' School,* 261 *Hamilton* Terrace. Rev. JOS. RICHEY, M.A., Rector. Address the Sister Superior.

*BALTIMORE FEMALE COLLEGE; incorporated* in 1849, and endowed by the State in 1860. It has commodious new buildings, ample grounds, good apparatus and library, and a Faculty of eight Professors. For catalogues, address N. C. BROOKS, LL.D., President.

*BOARDING SCHOOL FOR BOYS, Throgg's* Neck, Westchester, N. Y. Boys prepared for College, Scientific Schools, or Business. B. T. HARRINGTON, Pr'cipal.

*BOARDING SCHOOL for Boys and Young* Men at Wilton, Conn. Home comforts. Healthy location. Terms moderate Address AUGUSTUS WHITLOCK.

*BORDENTOWN FEMALE COLLEGE,* N. J. Graduating courses in Science, Classics, and Music, with degrees conferred. Rooms newly and nicely furnished. REV. WILLIAM C. BOWEN, A.M., Pres.

*BOSTON, MASS.—The Newbury Street School* for Young Ladies. For list of instructors and full information, address Rev. HENRY C. BADGER.

*BOSTON UNIVERSITY.—W. F. Warren,* LL.D., President.—Co-operating Faculties at ATHENS and ROME:

School of All Sciences—Post-Graduate Department.
School of Theology—Dean, Rev. J. E. Latimer, S.T.D.
School of Law—Dean, Hon. Geo. S. Hillard, LL.D.
School of Medicine—Dean, I. Tisdale Talbot, M.D.
School of Oratory—Dean, Lewis B. Monroe, A.M.
College of Liberal Arts—Dean, Rev. J. W. Lindsay, S.T.D.
College of Music—Dean, E. Tourjee, Mus. Dr.
College of Agriculture—Dean, Wm. S. Clark, Ph.D., LL.D.
Preparatory Academy Princ., F. D. Blakeslee, A.M.

For information concerning any Department, address the appropriate DEAN, Boston, Mass.—The University Year-Book (pp. 128) will be sent by the Registrar, Dr. D. Patten, on receipt of 25 cts.

*BOYS AND YOUNG MEN privately fitted* for College. Conditioned or rejected candidates coached. Stockbridge, Mass. F. HOFFMAN.

*BROOKEVILLE ACADEMY. A Home School* for Boys. Midway between Washington and Baltimore. Board and Tuition $250 per annum. Boys prepared for Naval Academy and West Point. Send for Catalogue or address the Principal, Prof. S. H. COLEMAN, Brookeville, Md.

*CARLETON COLLEGE, Northfield, Minn.* Open to both sexes. J. W. STRONG, D.D., President.

*CHEGARAY INSTITUTE for Young Ladies* and Misses, 1527 and 1529 Spruce Street, Philadelphia, Penn. Madame D'HERVILLY, Principal.

*CHICAGO.—Union College of Law, of the two* Universities. V. B. DENSLOW, Secretary.

*COTTAGE SEMINARY, Pottstown, Pa. A* home school for girls, situated on Philadelphia and Reading Railroad, forty miles from Philadelphia. Thirty boarders. Twenty-sixth year. For catalogues, address GEO. G. BUTLER, A.M., Principal.

*COLUMBIAN UNIVERSITY, Washington,* D. C.—College, Law, and Medical Schools. J. C. WELLING, LL.D., President.

*CORNWALL HEIGHTS SCHOOL, Corn-* wall-on-the-Hudson, N. Y. Not military; grounds, twelve acres; limited to thirty resident members; four male teachers and three lecturers.

*CLASSICAL INSTITUTE, Waterville, Me.* A first-class institution. College preparatory course, three years; Ladies' collegiate course, four years, with degree; tuition, $6 per quarter; board, in club, $2 25, in families $3 to $4, per week. Send for catalogue to J. H. HANSON, LL.D., Principal.

*CLEVELAND SEMINARY. Boarding School* for Girls. For catalogue, address S. N. SANFORD, Pres., Cleveland, O.

*DENISON UNIVERSITY, Granville, Ohio.* Address Rev. ELISHA B. ANDREWS, Acting President.

*DREW THEOLOGICAL SEMINARY,* Madison, N. J. Address the President, JOHN F. HURST, D.D.

*DR. J. SACHS'S COLLEGIATE INSTI-* tute, 101 West Forty-fifth Street. Pupils prepared for Harvard, Cornell, Columbia. German a special feature of the school.

*DR. MEIGS'S Family School for Boys, Potts-* town, Pa. Classical, Scientific, and English Courses.

# The Nation.

*NEW YORK, THURSDAY, SEPTEMBER 16, 1875.*

## The Week.

WITH the Maine and California elections, the Republican Convention in New York, and the Democratic in Pennsylvania, the politics of the autumn may be said to have fairly begun. The course of events thus far seems to show that the "tidal wave" of last year has not spent its force; at least the election of a Democratic ticket in California, in the face of a large independent vote, taken together with the small Republican majority in Maine (5,000 where 10,000 or 12,000 was expected), is difficult to explain in any other way. While the strength and volume of the movement thus seems to be again proved, its exact character—whether it is to be a tidal wave of peace, prosperity, and good-will, or of general devastation and destruction—is still involved in grave doubt. The Democrats in Pennsylvania have had a hard struggle over the currency question, and the closeness of the contest shows that the party, or at any rate the politicians of the party, in that State are pretty nearly evenly divided. The platform actually adopted is a close imitation of the Ohio resolutions on the subject, denouncing the "contraction" of the currency "made by the Republican party, and the further contraction proposed by it with a view to forced resumption of specie payment," which already "threatens general bankruptcy," and demanding that the volume of the currency be made and kept "equal to the wants of trade," "leaving the restoration of legal-tenders to par in gold to be brought about by promoting the industries of the people and not destroying them." Further than this, the Democrats want the Government to "cease to discredit its own money," make legal-tenders "receivable for all public dues except where respect for the obligation of contracts requires payment in coin," and collect "at least one-half of the customs" in greenbacks. This is going one step further than the Ohio reformers.

The remainder of the platform is of course strongly for the purification of government, denouncing the State Treasurer, demanding a thorough overhauling of the Treasury accounts, and, in the queer phraseology of political bodies, "pledging" the nominees of the convention to "apply all moneys in the sinking fund, as required by law, in the reduction of the public debt, and thereby save the interest on the same to the amount so reduced," and promising that if the State be turned over to them they will collect all public dues and pay them into the Treasury, and "not in any manner, directly or indirectly," "employ public moneys for their own profit or purposes." The nominee for Governor, Judge Pershing, is himself a reformer, who has been sentencing some county officials for "employing public moneys to their own profit," and he is also a hard-money man. A party which promises the people all the money it may want, and at the same time promises to steal none of it, makes a bold bid for popular support. We trust that the Ohio and Pennsylvania reform platforms of this year, together with biographies of the candidates, will be placed on exhibition at the Centennial. Europe has nothing to show at all like them.

The Republican Convention at Saratoga was well managed, and adopted a platform advising "a just, generous, and forbearing policy in the Southern States," and a refusal to use troops "except for purposes clearly defined in the Constitution"; demanding honesty and reform everywhere, and commending the action of all officers, State or national, who are reformers; insisting on a legislature pledged to reform, as well as more Canal reform; congratulating the Republican party on its practical extinction of the State debt; denouncing further inflation as a "public calamity," and insisting on "the speediest possible return to specie payments"; asking for a "careful and wise review" of the "whole subject of taxation"; recognizing as "conclusive" General Grant's withdrawal; declaring with the "sincerest gratitude" their "unalterable opposition" to any third term for anybody; denouncing all sectarian assaults upon the public-school system; and thanking the Administration and the "distinguished soldier and patriot who stands at its head" for their various good qualities and acts. Mr. G. W. Curtis was chairman of the convention, and, considering the anti-third-term resolution, and the fact that Mr. Curtis is a representative of the better class of Republican supporters who were thrown overboard by Grant when he abandoned civil-service reform and put himself in the hands of Morton, Shepherd, and Casey, this action of the Convention is an indication of that "reform within the lines" which we used to hear so much about, but which did not really begin until the overwhelming Democratic victories of last year made the combined Log and Stork kind of government which had been going on no longer possible. But the reform in this State probably comes too late. The Custom-House was present in full force, but, instead of carrying things with a high hand, Marshal Sharpe and his friends seem to have made up their minds early in the day that the only way to keep the party together and make a good show was to put forward its best men, so that the Convention was marked by an amount of self-sacrifice on the part of the "bad men" such as is rarely seen in political bodies.

Mr. Henry Wilson has written a letter to the Republicans of Massachusetts which has received a good deal of attention, though it does not contain a single definite statement about any person or thing, or any advice more specific than the expression of a sort of prayerful hope that the minds of his party may be filled with justice, mercy, and charitableness, and a desire to do right in the sight of a good majority. He says that the hour has come to "forgive, forget, and unite," but does not say with whom; that there ought to be a "full and frank comparison of views," but he does not mention what views; that the Republican party can take "no step backward" from its position on "human rights," from which we are forced to infer that there are some backsliders who wish the Republicans of Massachusetts to come out for the reintroduction of slavery at least, but no information is given as to who they are; declares that "mistakes have been corrected, and are being corrected," but does not tell us what the mistakes were, or who made them; declares that the party should be put right on the "living issues that divide the country," but does not say what these issues are; advises it to "open wide its doors," but does not mention to whom; says that its "tried and trained leaders should be brought to the front again," but does not say how; that, when brought to the front, "their wisdom should be sought for counsel and guidance"; and Republicans as a body should "look peril in the face" and "act in a spirit of self-abnegation." The "living issues" now before the country are beyond a doubt one or more of the following things—revenue reform, the third term, the use of troops in the South, the currency, repudiation, the school question, and "cheap transportation." What stand Mr. Wilson would have the party take on them is a matter, so far as this letter goes, of pure conjecture. Meanwhile, an independent movement has been started in Boston, looking to the nomination of a third candidate. Its strength is at present difficult to estimate.

A call has been issued by a number of gentlemen in New York for a hard-money convention, to be held in Cincinnati on the 25th of next month. This call has grown out of a public meeting held at Richmond on the 4th of May, when a resolution was adopted calling a convention to "confer about measures to restore specie payments and to correct the evils of our national revenue system." The Municipal Reform Association took up the matter in this city, and a committee of twenty-six has been appointed to go to Cincinnati. The importance of the movement will depend almost entirely on the character of delegates and the amount of interest in it manifested throughout the country. There can be little doubt that what

is now chiefly needed is a discovery of the amount and extent of the popular demand for more paper. We have very little doubt ourselves that it is in reality small even in the West and South, but unfortunately the discontent caused by the general financial depression is so mixed up and confused with the disgust caused by Republican misgovernment, that it is easy enough for demagogues to persuade each other, if no one else, that by making the Republicans appear as a party of "contraction" and the Democrats as the party of relief through inflation, more votes will be got. Under the present state of affairs, an overwhelming Democratic victory in Ohio will be taken by the inflationists as a triumph of inflation, while there is no saying that the majority would not have been obtained in any case by other causes. We may say the same thing of Pennsylvania. In New York there is no question of the currency between the parties, so that the result will throw no light on it. Besides this, in Ohio and Pennsylvania even an overwhelming Republican victory would not prove so much about the currency as we could wish; for the platforms in both States are somewhat double-faced on the question, and the speakers in Ohio, or many of them, have taken very good care not to commit themselves either for or against "rag-money." Under these circumstances, any really popular expression of opinion in favor of contraction—not "gradual steps," but plain contraction in so many words—would (particularly after the futile attempt of the inflationists to bring out any popular expression on their side) do a great deal to bring conviction to the hearts of the politicians.

---

The price of gold advanced during the week to 117⅛, and sterling exchange fell to nearly the point at which gold can be imported. The rise in gold was due to a combination of causes. In the first place, the amount of gold in the New York market has been so reduced that it is within the power of speculators to control it, and this power they have acquired. Their original purpose was undoubtedly to hold the market and dictate to borrowers such terms as they would pay, or to sell them what was wanted, if they got tired of paying high rates each day for use, at an advance on the cost of the gold. Such a purpose was generally understood by bankers, and, before it was developed, foreign exchange became weak, as bankers naturally pressed their bills for gold, and buyers, rather than buy bills, held their gold to lend. While this was the condition of the market, news came that the Democratic State Convention of Pennsylvania had, following the footsteps of the same party in Ohio, declared in favor of the continued use of irredeemable paper-money. Naturally, this attack on the public credit created alarm, and there were free buyers of gold among people who had no interest in or sympathy with the original speculation. Should the States of Pennsylvania and Ohio be carried by the Democrats with such declarations on the currency question, an irreparable injury will be dealt the public credit, and, indirectly, corporate and private credit all through the country. Europe fortunately has not yet taken the alarm, probably regarding the action of these two State conventions as exceptional, and not reflecting the sentiments of a majority of the people of this country. It requires no prophet to foresee the result of Democratic victories in these two States next month, particularly in view of the influence they may have on the National Convention which will make Presidential nominations. Outside the gold and foreign-exchange markets there has been little of interest. The Stock Exchange has been in a feverish condition because of continued rumors of the embarrassments of banks and bankers. All of these have proved unfounded, the suspension on Saturday of the old banking-house of F. Schuchardt & Sons not having been expected nor rumored. This was an old firm, and highly respected, but did little or no deposit business. Its troubles came from advances, before the panic of 1873, on securities which have since proved almost worthless; and since 1873 it has been "rusting out." There is nothing new of an official character in regard to the Bank of California; it is understood that it will soon be reopened for business with an enlarged capital. General trade during the week has been fairly good, and mercantile interests have suffered less than might have been expected from the Wall-Street disturbances; the export trade of course was injured by the demoralization of the foreign-exchange market. The New York banks have begun sending currency to the West, and shipments are composed almost entirely of legal-tender notes, so that they diminish each week the bank reserve; bankers expect a 6 to 7 per cent. money market before November.

---

An immense mass-meeting has been held in San Francisco in vindication of Mr. Ralston's memory, and resolutions have been adopted strongly condemnatory of all attacks on him. Two newspapers, the *Bulletin* and *Call*, were specially singled out for reprobation, and the attack on them and the Associated Press has brought out Mr. J. W. Simonton, the Associated Press manager, in their defence. He says that the newspapers in question in which he has an interest, as well as the Associated Press Agency, have been managed throughout with no other desire than to represent the facts fairly and to report the news. The truth of the matter seems to be that the extreme violence of the attacks on Mr. Ralston, as well as the extreme warmth of the vindication of his memory, have come from a general popular deficiency of what may be called moral perspective. Mr. Ralston was an able, energetic, pushing man, almost without education, very fond of money, or what money would bring, as he was of ostentation and all material pleasures. He obtained a great deal of money and power, which he used to get more money and power. In doing this, he naturally was obliged to "develop the struggling industries" of the Pacific coast, or, in other words, to put his money into mines, factories, and hotels, and so became a great employer and general benefactor. Being known to invest his money well, other people came to him to invest their money too, and thus he became what is known as a "banker"—that is, a flourishing money-lender and speculator in all directions. Besides this, he was a kind-hearted man, ready to oblige people, and, like most self-made men, ready to help on other self-making men. Every one knew, however, that he had little or no education and few old-fashioned legal notions about trusts, so that it was more than probable that, if he went "to smash," a great many people whom he had benefited would go to smash too. Of course, the Pacific Slope had the right to look upon him as a hero and to rejoice in his mines and his hotels and his relays of horses; but, if it did so, it ought not to go into a fury over the confusion that ensued at his failure. *Vice versâ*, if "the Slope" was going to be shocked by speculative banking, it should not have made Ralston a popular hero, but selected some quiet, conservative, conscientious old gentleman, without extravagant tastes or a hearty, magnetic way of making things "spin." Certainly, everybody who put money into Ralston's hands to help on "the Slope" is under bonds now to vindicate his memory.

---

The Chicago *Tribune* contrasts very strongly the municipal debts of New York and Brooklyn, contracted under the old-fashioned unlimited-sovereignty plan, with that of Chicago, which is restricted by the new constitution of Illinois to five per cent. of the assessed value of the property within the city. The debt of New York is, in round numbers, a hundred and thirty-two millions, and it has increased four millions within a year; but the exact amount, as our readers know, is always in dispute, and in fact, though the credit of the city is very good, the debt is a kind of mystery which the Comptroller always seems to be doing his best, without any success, to clear up. The debt of Brooklyn is variously calculated by "arithmetic men" as their temperaments happen to be sanguine or despondent. It is at least twenty-two millions, and there are ten millions more made up of what are called in the beginning "temporary" loans, but which, like all temporary things, become with lapse of time chronic. The city of Chicago has passed through two severe crises within the last few years, one of which was entirely local, and of a nature to make absolutely necessary the expenditure of enormous amounts of money. In Boston, where a calamity of

the same kind occurred, but much slighter, the Legislature at once authorized a loan of $20,000,000, which (had it not been declared unconstitutional by the Supreme Court) would now be saddled on the city of Boston as a permanent addition to her debt, though no doubt well enough secured. Yet Chicago, strange to say, has contracted no excessive obligation, and, notwithstanding the fire and the panic, is to-day, with a debt of only $9,000,000, probably better off than any city of its size in the United States. These facts show certainly more clearly than any argument could the strength and value of constitutional limitations on municipal indebtedness.

The investigation of the Indian frauds seems, as far as can be made out from the scattered telegrams which describe the evidence, to be substantiating the charges brought by Professor Marsh. Meanwhile, Mr. Delano has been making another revelation of the character of the men whom Grant retains while "under fire." Meeting Mr. Marsh at breakfast in a Washington hotel, Mr. Delano asked the latter when he "was going to cease attacking him," and upon Mr. Marsh's replying, "Probably when you cease attacking me," poured out a flood of abuse upon Mr. Marsh, calling him a "liar" and a "poltroon," and heaping upon him every sort of insulting epithet which he had at his command. During all this, Mr. Marsh, fortunately for himself, was able to keep his temper, and finally Delano, after exhausting his somewhat extensive vocabulary, left the room. The scene is described as a strange one "even in Washington." There has been one place, and only one, in the country, and that some years ago, where such a scene would not have seemed strange or anything out of the usual course of politics—and that was in New York when the city was governed by Boss Tweed.

The Beecher case has come up again in a new form by the publication of a correspondence between the Brooklyn District-Attorney, Mr. Winchester Britton, and Mr. Moulton and Mr. Beecher, on the subject of the indictment against Moulton. This case has been dragging on for a year, the prosecution being unwilling to go to a jury with it, though the defendant has been pressing for a trial. Last month Mr. Britton wrote to Mr. Beecher calling his attention to the case, and suggesting that inasmuch as substantially the same facts had been tried in the civil suit, and as in a criminal proceeding the defendant would be entitled to the benefit of any reasonable doubt, there would not be much chance of getting a verdict, and that on this account, as well as in the interest of public morality and of the county treasury, it might be better to drop it. To this Mr. Beecher wrote a reply, which has not been published, agreeing with the suggestion, and Mr. Britton at once informed Moulton. Moulton, however, took, as might have been expected, a radically different view of the situation, and wrote a long letter, calling Mr. Britton's attention to the fact that while it might be for the interest of the prosecutor to drop the suit, it might not be for his own to have it dropped; that though a jury might not be able to convict, there was such a thing as an acquittal, which is exactly what he—Moulton—wants; and that he therefore demands a trial for his own vindication. Of course, the case will not be tried unless the Tilton men manage in some way to capture the District-Attorney's office and put one of their side in Mr. Britton's place; but it must be confessed that, as the matter stands, the correspondence does not do Mr. Beecher any good, for it is clear to demonstration that a jury could find no evidence in Moulton's case to support anything but a verdict of acquittal.

The proofs of the soundness of Bismarck's policy towards the Church are beginning to show themselves, and we have no doubt will now rapidly accumulate. The bishops are one by one signifying their willingness to obey the Falk laws in the matter of church property—that is, to submit to share its administration with a representative board elected by the laity. It may be said, it is true, that their acquiescence in a matter so secular in its character does not necessarily indicate any readiness to submit in other matters more distinctively ecclesiastical, such as the education of the clergy and the infliction of ecclesiastical pains and penalties; but the answer to this is that when the clergy first refused obedience they made no distinction between the different portions of the obnoxious legislation. Submission to any portion of it was declared utterly impossible, and all of it was pronounced damnable. Their course in Prussia is, however, strictly in accordance with the time-honored policy of the Church everywhere—which has always been that of good politicians—viz., to get all it can, but if it cannot get all it wants, to be content with what it does get. Therefore, the state in dealing with the Catholic clergy can hardly go wrong, within the bounds of secular reason and justice, in forcing them to submit to such legislation as the interest of the state, from the secular point of view, seems to require. Such legislation is sure to be followed by a year or two of great bluster and much damnation, and a large crop of "martyrs," but as soon as it is clearly seen that the Government is not frightened and will not recede, the order or permission to adapt themselves to circumstances is sure to come from Rome, either openly or privately.

A case in point is just occurring in Canada, where a gentleman was excommunicated by the bishop because a literary institute in Montreal of which he was a member had refused to remove certain books from their library condemned by the bishop. Under this decree interment was refused at the death of the person in question, M. Guibord—although he owned a burial lot—except in the portion of the graveyard assigned to criminals, suicides, unbaptized children, and the like. The Canadian courts decided for the Church, but on appeal to the Judicial Committee of the Privy Council the decision was reversed. When under this final judgment the body was carried to the cemetery, it was repulsed by an armed mob, and pending a new attempt at burial the body has had to be guarded by an armed force in the Protestant cemetery. The mob will no doubt eventually be dispersed with bloodshed, and Guibord be buried after a riot. Under the Prussian law, the bishop as soon as he signed his decree would have been quietly arrested by the police and lodged in jail; the priest would have shared the same fate; and the whole affair would have passed off quietly, without loss of life, and we should have heard no more of this form of ecclesiastical punishment. The Prussian law allows the clergy to do what they please in hell, purgatory, and such places, but does not allow Prussian subjects to be inconvenienced or annoyed by ecclesiastical censures while in the flesh and on earth.

Recent official statistics show that the government of Italy, a country which had nearly 27,000,000 inhabitants at the close of 1871, rests on an electoral basis of less than 600,000 (571,939 in 1874). For more than a dozen years the proportion of electors has been about two per cent. of the total population. It was 1.92 per cent. in 1861, and 2.08 per cent. in 1865–66, after which it declined to 1.98 in 1870, and last year became 2.13 per cent. There are 508 electoral colleges, in which a steady increase in numbers has taken place; four-fifths of them reckon from 700 to 2,000 electors each, and only in a single case are there more than 3,000. Small as these figures seem to us, they are still further diminished by abstinence from the polls—a vice of the Italian voter which corresponds with his representatives' slackness in maintaining a quorum in the Chambers. On the first ballot for a national Parliament in 1861, only 57 per cent. of the legal voters turned out, and even this proportion has never since been equalled; in 1870, it was as low as 45. What is perhaps still more discouraging, the cities fall behind the average, and have shown a growing apathy on the part of the electors. In 1861, none of the five colleges of Milan voted less than 51 per cent.; in 1874, while one voted 42, the rest voted from 38 to 33 per cent. In 1870, Palermo, which in 1861 came out strong with 72 to 75 per cent., fell off to 32 to 15. Finally, the smallness of the governing body of the kingdom is still more clearly perceived from the fact that from 1861 to 1874, inclusive, the successful candidates have had the support of but 36 to 40 per cent. of the whole number of electors.

## PRIESTS AND MINISTERS.

ONE of the semi-religious papers has suggested during the week—and the suggestion has been re-echoed by a portion of the daily press—that the interference of the Catholic clergy in politics, such as has been recently witnessed in New Jersey, was fair and unobjectionable, because the Protestant clergy did the same thing. If ministers uphold the common-school system in the pulpit, and urge their maintenance as one of the duties of their flocks, why, it is asked, should not priests urge their flocks to overturn it, and even distribute ballots to such Catholics as are willing to do their bidding? The Protestant clergy discuss nearly all the prominent topics of the day in their churches now and again, and do instigate their congregations to take a particular line of action at the polls. They have done so with regard to slavery, with regard to the late war, with regard to temperance, with regard to marriage and divorce, with regard to donations of public money to Catholic institutions, and there is no sort of doubt that if our common-school system should be seriously threatened in the interest of any party or denomination, they would make their churches resound with exhortations to vigorous opposition. The conclusion is, therefore, that the interference of the bishops and priests in the decisions of questions of contemporary politics is but part of a legitimate game of church against church, in which all ecclesiastics have a right to participate as long as they violate no positive law.

This has so much the look of being "a broad view" that it will doubtless find favor with a great many Sentimentalists, as well as with some hard-headed people who plume themselves on their love of fair play, and think everybody is entitled to a hearing, and that as long as a priest or anybody else refrains from physical coercion, his efforts to persuade people on any subject ought not to be resented. In reality it is, however, a very narrow and one-sided and misleading view, and furnishes a good illustration of the way people are imposed on by names. It is a deduction from an assumption which has no foundation in fact, viz.: that a Catholic priest and a Protestant minister are both pastors of the same sort, and stand in the same relation to their flocks. We have no doubt that for the purpose of political agitation the Catholic clergy would be very glad to have this notion of their character and functions gain currency, but it would be a very unfortunate thing for this community if it were allowed to do so. The Protestant minister addressing his congregation does so as an American citizen, whose highest allegiance is avowedly due to the American Government, and who acknowledges that his highest political duty is to obey the law of the land. He addresses them, too, as a fellow-citizen, and as in all respects a man like themselves, whose duty it is to lead them in certain religious exercises, in which, however, they take part, or may take part, as fully as he does. Some of his functions, such as the administration of the sacraments, are peculiar to him, but they do not clothe him with supernatural authority for other and different purposes. The ecclesiastical tribunals, too, to which he is amenable, are composed of American citizens, and are only in part clerical—the laity are fully represented in them. Though last, not least, the sermon or other address of the minister to the people always has been in the Protestant Church, and is now more than ever, a discussion of some topic by a man of exceptional qualifications, in the presence of the congregation, and by no means an utterance of the divine oracles. If the audience do not like his methods or do not agree with his conclusions, they dismiss him, and provide themselves with another orator, and the attention they give him is the attention of indulgent critics rather than that of disciples. They are guarded by tradition, by education, and by temperament from ascribing to his words any authority beyond what the force of his arguments and their general estimate of his character and ability give them. His preaching a political sermon, or his offering political advice in the pulpit, therefore, has never been seriously objected to on the ground that it was likely to exert an unhealthy or unlawful influence on his flock, or force upon them considerations which were likely to separate them in thought or feeling from the rest of the community, or to weaken their allegiance to the state. What has been said against it is that it has a tendency, by presenting the minister to the world as a partisan debating subjects on which his authority was not specially weighty, to lessen his influence, and diminish popular respect for his office, when he came to speak of things purely spiritual.

The position of a Catholic bishop or priest is widely different. He is in the first place appointed, or removable at pleasure, by a foreign prince who claims paramount jurisdiction, by divine appointment, over all the governments in the world, in all matters which he chooses to pronounce spiritual or pertaining to the spiritual, and who holds himself able, when speaking under certain conditions—to the absence or presence of which nobody can testify but himself—to decide absolutely on the right or wrong of every question of human interest. In the second place, the bishop or priest, though nominally an American citizen, is in his ecclesiastical character clothed with an authority so tremendous and supernatural, and belongs to an organization so vastly transcending the state in power, importance, and duration, that his citizenship inevitably seems a trifling and insignificant thing. He has no fixed domicile, and cannot have. Neither his will, his reason, nor his interest has anything to do with determining the place of his abode. He is in New York to-day, but he may to-morrow be transferred to Patagonia or China by a power which in his eyes bears about the same proportion to the State or the United States as God Almighty to a black beetle. Nor is he bound to the political community, as the Protestant minister is, by those ties of family to which patriotism owes so much, if not all, of its force. He has neither wife nor children nor home, and the great object of denying them to him is to prevent any distraction of his devotion from the interests of the Church, or any strong sympathy with the purely secular hopes or ideals or repugnances of the community in which he is quartered.

Moreover, he does not *discuss* in the presence of his congregation; he does not debate with them or balance arguments, or seek to persuade or convince them. He hardly even instructs them; he promulgates the law in the name of the Church, and the law armed with sanctions of the most terrible and imposing character. He has no doubts on any of the problems of the universe. If he refrains from speaking on any knotty question of the day, it is not because he has nothing to say, or no solution to offer, but because he considers the matter indifferent, or one around which the feeble reason of his flock may be safely allowed to play freely. It is true that when he speaks, he does not always speak or profess to speak the mind of the Church; but then, even the *obiter dicta* of persons who are the daily and exclusive exponents of the mind of the Judge Eternal are hints which a worshipper, even if strong-minded and educated, will not feel it safe to disregard. They are hints which the ignorant worshipper is sure to take as the utterances of Supreme wisdom. The conduct of a good Catholic in the discharge of his public duties must make either for or against the interests of the visible Church. If it makes against them, he is hindering the sole means provided by Almighty God for the salvation of mankind from everlasting damnation; and of these interests, who knows so much as the clergy? Who else, indeed, knows anything? Whenever, therefore, a priest advises a Catholic how to vote, or tells him what the welfare of the Church requires, even if it be in the street, it is absurd to suppose that the layman treats it as the advice of a fellow-citizen, to be taken or left in his discretion. Common prudence, if no other consideration were present, would require him to regard it as a voice from the other world, which might save or ruin him.

It will be, in short, a sore day for the United States when the people of this country allow themselves to be seduced into the belief that the Church of Rome has become reconciled to republicanism or to liberty of thought, or to anything else which recognizes the existence of any rule of conduct, in small things or in great, not furnished by herself, or that the Catholic clergy have the least

intention of putting themselves on the same level with or using the same weapons as the Protestant clergy on the school question, or any other question which is likely to affect their own power, either nearly or remotely, directly or indirectly. It must not be forgotten that the Protestant Church is a body of sects, without fixity of organization or discipline or purpose or doctrine—part of the state, and blended with the state in a thousand ways, and changing in beliefs and composition from generation to generation; while the Catholic Church is a vast machine, belonging to no country, submitting itself to no authority, asserting itself against all authority, and served by a body of ecclesiastics who have severed all earthly ties in order to serve it more effectually, and who are governed by orders more completely than any army; and that its policy, and designs, and motives are veiled in the strictest secresy, and that no pledge or promise of any of its agents can bind or conclude it in any manner. The duty of the state towards these agents is therefore plain, and settled by much experience, and that is, to legislate exactly as the secular interests may seem to require, but to make no agreements or treaties with them, and to be affected by no concessions or compromises they may offer, and not to be frightened by any use they may make of such phrases as "religious liberty" or "equal rights." The policy to which they have adhered for ages is to ask for everything, including the government of the country by an archbishop, but to take what they can get, and always after a rebuff to play the martyr, and, when further gains are hopeless, to settle down cheerfully until the public irritation has subsided, and then try again. The bishops and priests die, and come and go, but whoever they are, and whatever they may say, we know that they do and must believe the whole of our political and social fabric, our government, our marriage, our education, our religion and manners, to be a monstrous and beastly revolt against God and his ministers. Any priest who professes he does not so regard them may be doing his duty, but any American voter who is led into carelessness or indulgence by these professions is not doing *his* duty. No church occupies or can occupy the same relation to the state as the Roman Church, and it may therefore be properly made the object of extraordinary vigilance and distrust.

## THE LAWYERS AND THE PUBLIC.

THE controversy over the late decision of the Court of Appeals is not yet ended, and will probably not be ended for some time. It is conducted in the main by lawyers, and by lawyers, too, of prominence in their profession, and they all appeal to the public—one set against the Court of Appeals, and the other set against Judge Davis, or the Court below. Those who had no hesitation in accusing Judge Davis of corrupt bias are, however, shocked that any imputation should be cast on the Court of Appeals, while those who assail the Court of Appeals are shocked by the imputations on Judge Davis. As well as we can make out, the bar on the whole sides with the Court of Appeals, and thinks that body unjustly treated, in spite of Mr. O'Conor's high authority. The public does not well know what to think, and listens to the debate on "cumulative punishment" with more or less bewilderment, knowing well that, though the arguments on both sides are addressed to it, neither side would be disposed to attach much weight to its decision on the disputed questions of law. But that it has formed an opinion, and a very strong one, about the whole affair is quite certain; and this opinion is one which, though of no great legal importance, may some day come to have considerable importance to the legal profession, and as such we would commend it earnestly to the consideration of both the bench and the bar.

The preparation of rules of procedure, as well as the legislation relating to the organization of the courts and to the definition and punishment of crimes and offences, has been for a long period—in fact, ever since the foundation of the Government—left in the hands of lawyers. There is not now, and never has been, in this State, or indeed in the Union, any body of amateur lay "jurists" who have either the will or the way to take this work out of their hands. As a general rule, the people, except in the matter of electing judges, has followed the lead of lawyers in anything relating to the administration of justice, and has left the bar free to form its own code of morals and discipline, or to have neither morals nor discipline, just as it pleased. Indeed, even in the matter of electing judges, it is confidently affirmed that the firmest opponents of all change in the system in those constitutional conventions in which change has been proposed, have been lawyers from the country districts, who like to have a chance of being judges themselves. Now, that the result has not been very satisfactory to private litigants, either as regards speed or certainty, is well known; but then private litigants have always been grumblers. There is a good deal of truth and pertinence in the saying that courts are after all intended for the use of those who do not go to law rather than for that of those who do, and that "cheap and speedy justice," however attractive it may seem to the ardent reformer, is apt to be poor justice. People are, therefore, content to put up with a good deal of delay and expense in getting their private quarrels settled, and have never showed any captious disposition to look curiously into the causes of the law's tardiness or costliness.

When, however, it was found possible for a man like Fisk to raise himself, with the aid of the courts, practically above the law, and to have the aid of able counsel in all the tricks and dodges by which he did so, and to set justice at defiance for a series of years while committing the most flagrant outrages on morality and decency; and when the public was told, when it got angry, that the helping of such scoundrels to seize and bring home their plunder was, under certain circumstances, a part, and an honorable and useful part, of a barrister's duty, there passed over the popular mind a wave of disgust, the traces of which have by no means disappeared. The discussion which followed on "professional ethics" did not mend matters; in fact, it made them worse. The more it was proved that Messrs. David Dudley Field and Thomas G. Shearman were only earning an honest penny in doing Fisk's work, the stronger grew the doubts of decent layman whether a profession of which these two gentlemen were conspicuous and successful members was anything but a political and social nuisance, which had better be in some manner abated.

These doubts were held in check, or for the time suppressed, by the efforts of the Bar Association to purify itself, and by the trial and punishment of Judge Barnard and the resignation of Judge Cardozo, but they were by no means entirely removed, and Tweed's trial has certainly revived them. Here was a man who got possession of the city treasury as trustee, and then, with a few confederates, did exactly what a party of burglars who had broken into a bank would do—divided the greater part of the money between them. When he was detected, the community made the startling discovery that it was very doubtful whether the lawyers had provided any but the most trifling punishment for this kind of offence. When, too, it was proposed to sue him in order to recover the money, not only was it found that there was no other way of getting it back, but the lawyers were divided in opinion, and spent a year in discussing who was the proper person to bring the suit. Some said the State, and others the county. The objection to the latter was that the county officials were in league with the robbers; and for this contingency, also, the lawyers had made no provision. Moreover, when Tweed was at last arraigned, and by marvellous exertion a jury was obtained to try him, it was found to be possible and regular for some of the most prominent members of the bar to employ in his behalf every device known to the art of chicane, however mean or minute. They challenged everybody, beginning with the judge, excepted to everything, argued everything, and wrestled and tugged and sweated in defence of a notorious and undoubted criminal who had no defence on the merits, with a zeal and a sacrifice of self and of the more respectable appurtenances of self which, it ought to be said plainly, the better,

more moral, and more intelligent part of this community found very repulsive. It began to say that it was a mockery to talk of a profession in which these things were possible as an "honorable profession," and that it was very difficult to believe that a profession which could provide no better means than this of trying criminals, or recovering stolen property, was a useful profession.

The Court of Appeals scandal, for such it may properly be termed, has of course done much to strengthen these unfavorable impressions. People do not know, or profess to know, who is right or who is wrong about the law of the matter; but they know that there is a most extraordinary difference of opinion among lawyers on a point of great public importance, which has been again and again decided. They see the Court of last resort going against its own previous decisions, with, on the part of some of its members, an air of flippant indifference, for the benefit of a dangerous and powerful criminal; and they are asked not only to give the Court credit under these extraordinary circumstances for perfect integrity, but to accept this mode of administering justice as so satisfactory that nothing ought to be said about it, and that the people ought to thank God for their bench and bar and go about their business.

There has never been a time in modern history when the growth of a feeling of hostility to or contempt for the legal profession would be more unfortunate than this in which we now live. With all its faults, the profession does more at this moment to hold our political fabric together than almost any other visible agency. It is the one organized body which is engaged in making practical applications of morality, and in recording and preserving the experience of the race on the weightiest matters of social and political progress. It supplies the bone and gristle without which a great deal of our legislative action would be mere blubber, soluble in the sun or by the rain. Its loss, or the loss of its hold on popular confidence, would therefore be a great loss; but the prevalent sentimental dislike of precedent constantly threatens it, under the most favorable circumstances, with a serious curtailment of its authority. It is not, therefore, on account of the profession simply, but in a far larger degree on account of the community, that it is to be hoped that lawyers and judges will consider seriously the effect of their recent performances in this State on public opinion. If they are to retain their present honorable and influential place in our political system, they really must mend their ways. They must not flatter themselves, because laymen do not understand what they are quarrelling about in such cases as this of Tweed's, that they therefore consider their quarrels edifying or endurable. There is a very levelling spirit abroad, a strong disposition to judge both men and callings, not by their claims or pretensions but by their work; and enormous interests, moral and material, depend for their safety on the continuance of popular respect for the lawyers. Any marked diminution of it would seriously affect both the public credit and the security of property. It has diminished enough already to make the present crisis a grave one, and to satisfy most thinking men that there must be a considerable increase in the public spirit, the self-respect, the sense of decorum and of professional honor, on the part of both bench and bar, if we are to escape great loss and suffering.

## THE RECENT GOETHE CELEBRATION.

THE twenty-eighth of August last merits more than a passing notice, for on that day was celebrated the anniversary of Goethe's birth. The proceedings were conducted under the auspices of the Goethe Club, and culminated in Mr. Bryant's address and Bayard Taylor's ode. Serious exceptions must be taken to some of Mr. Bryant's judgments. While occasional slips in dealing with second-rate characters are venial, any decided error, whether of fact or judgment, in the discussion of a master-mind calls for prompt correction. Whoever undertakes to speak of a Shakspere, a Dante, or a Goethe, must be held to the strictest account.

In Mr. Bryant's address occurs the following passage:

"In this country of free institutions we cannot make Goethe our model in politics. It is urged against him, with too much show of reason, that, possessing a power over public opinion which would have given effect to his slightest remonstrance against absolute government, he yet acquiesced in its wrongs and consented to become one of those who profited by them. Those who take an unfriendly view of his character, complain that he did not care to make men happier, so long as his own condition was fortunate and agreeable; nor better, so long as their moral condition, whatever it might be, ministered to his convenience. He did not admit the truth of this accusation, but claimed that he had labored during a long life in overcoming pernicious prejudices and narrow views among his countrymen, in elevating and purifying the taste of the community, and that his real offence was that he would have nothing to do with party politics. I do not care on this occasion to discuss the question whether this was a satisfactory answer, and willingly draw a veil over the circumstances which might lead to an unfavorable conclusion."

We quote the passage *in extenso*, because it bears upon a sore point in German literary history. With all due respect to Mr. Bryant, it must be said that such views are *saugrenu*, and have little foundation. They were exploded long ago; they are now to be found only in school-books written by men who continue to look upon Gervinus as the model of an historian and literary critic. They sprang from a radical misunderstanding of the course of German history, and were perpetuated by the so-called German democrats, who could find no good in anything that did not fall in directly with their own narrow views. They have been belied by the recent sudden rise of Prussia to power and by the unification of Germany under a monarchical government. It is to be observed, in the first place, that Goethe *never* possessed that supreme influence over public opinion which has been ascribed to him by those whom Mr. Bryant has followed. He was merely the personal friend and privy councillor of the ruler of an insignificant duchy. His endeavors to influence merely the personal conduct of Carl August were not always successful. The duke, as the student of German history knows, had a decided will of his own. As to influencing him in political measures, Goethe felt that such was not his vocation. His field was plainly marked out for him: it was that of art, science, and letters. All that he could hope to accomplish outside of this was to keep alive in the mind of Carl August a love of humanity, a desire to be the beneficent ruler of his subjects. Herein he succeeded admirably. Many of the reforms introduced by the duke were suggested by Goethe, and especially the humane spirit which marked the Weimar government was due to the example and the silent, indirect teachings of Goethe and his associates. If we go beyond the limits of the duchy, we shall find that Goethe's influence upon the political action of Germany at large was null. It would have been null whatever course he might have adopted. Will it be necessary to remind the student that in those days there was no press in Germany, no organ of public opinion, no people even? If we turn to Treitschke's Leipzig oration of 1863, we may read: "When Scharnhorst (Goethe's contemporary) was young, a German king had to forbid his peasants kneeling and kissing the coat-sleeves of the officials." One may see almost as much, even at the present day, in the rural districts of Austria. The sober-minded historian shows us the German peasantry of the eighteenth and the beginning of the nineteenth century as a degraded, servile, ignorant herd. Yet the democratic doctrinaire of '48 would have us pronounce Goethe's life a failure, because he could not bring himself to look upon popular sovereignty as rightful, or even expedient. Goethe has left on record his opinion in the second part of 'Wilhelm Meister': "We need in our tongue a word which, like the correlative terms *Kindheit* and *Kind*, shall express the relation between *Volkheit* and *Volk*. The educator must listen to the *Kindheit*, not to the *Kind*. The lawgiver and ruler must listen to the *Volkheit*, not the *Volk*. For the former, the *Volkheit*, is always the same—is reasonable, constant, pure, and true. The latter, the *Volk*, for sheer wishing, knows not what it wishes. And in this sense the law can and should be the general expression of the will of the *Volkheit*, a will which the crowd never expresses, but which the sensible man perceives, which the reasonable man knows how to gratify, and the good man takes pleasure in gratifying." Does the entire body of German political literature contain a passage more applicable to the state of affairs prior to 1866 and 1871? All Germany—that is, the *Volkheit*—desired unity at home and dignity abroad; but the German *Volk*, to give Goethe's words in the original, *wusste nicht vor lauter Wollen, was es wollte*, until its great political teacher arose and gave it a bitter but wholesome lesson.

In estimating Goethe, we must bear in mind that we have to do with a German and with German affairs, and that there is no analogy between the American Revolution and the German revival. The former was the natural process whereby an insect shakes off its effete shell, the latter has been the tardy resuscitation of a patient dragged from the depths of the waters of bitterness. On the one hand, we have the uprising of a hardy, self-reliant, shrewd, and enlightened set of communi-

ties long accustomed to self-government; on the other, the regeneration of a people from above downwards. The lower classes in Germany are now possessed of freedom and security, and have a direct voice in the government; but the impulse to the change did not come from themselves, it came from the upper or the educated classes. In Goethe's day, at least until he had passed his prime, the change would have been a chimera. It was first necessary to create a certain community of interest and sentiment among the various German states, a something around which the Bavarians, Swabians, Hessians, Saxons, and Prussians might rally as their common property, and in so doing recognize one another as brethren. This bond of union was German culture, German literature and science. Goethe was not to blame that culture had to come first and unity and freedom afterwards. This order of national development resulted from causes which had operated long before Goethe's birth: we mean, of course, the Reformation, and especially the Thirty Years' War. Mr. Bryant, it is true, cites Goethe's reply to the unjust attacks of his contemporaries, but does not commit himself to an opinion. The best thinkers in Germany are, however, now ready to admit that Goethe's course in political matters was not only right, but the only possible one for him under the circumstances. Once for all, we repeat it, politics was not his vocation, and had he entered upon it, he would have wasted his time. The life of Stein elucidates this point. Stein was a born statesman, endowed by nature with every gift for administering the affairs of a great nation. Yet Stein failed, although he had an influence over political opinion such as Goethe never possessed; he failed signally, because circumstances were against him. Some of his legislative reforms still subsist as the basis of municipal organization in Prussia to this day, but his brightest dreams, his most ardent hopes, were scattered to the winds. Would Goethe, without Stein's talents, have succeeded better? Would he have made any head at all against such men as Metternich, Nesselrode, Talleyrand, and Wellington? It is puerile to speculate upon the rôle that a poet-philosopher must have played amid the international jugglery of the Napoleonic era.

## DEER-HUNTING IN SCOTLAND.

SCOTLAND, August 28, 1875.

TRADITION tells us that George the Second's Queen threatened, on a notable occasion, to turn the northern part of her dominions, namely, Scotland, into a hunting-ground. What Queen Caroline in a momentary fit of temper thus arrogantly threatened, the descendants of her English subjects, in a calm, cold-blooded manner, may be said to have effectually accomplished. The Highlands of Scotland have now become a summer playground for rich Englishmen. The old Highland chiefs, with their wild hordes of ragged retainers, who dressed themselves in tartan kilts and eagle feathers on great occasions for barbaric display, have disappeared almost as completely as the eagles from which the chieftains plucked their plumes. The world has become too rich for the chieftains and too civilized for the eagles. The wealth of England has bought out the one, and the whistle of the locomotive, awakening shrill echoes in the wild glens and corries of Sutherland and Ross, has scared the other. Wherever the fetters and restrictions of the law of entail (which till quite recently was much more stringent in Scotland than in England) have not prevented the old proprietors of the brown mountains and the salmon rivers of Scotland from alienating their lands, wealthy Southerners have stepped in and bought the Scotchmen out; and even where the Scotchmen were prevented by their entails from selling they have not the less deserted their old domains. They have let them for the shooting season to rich ironmasters or contractors or brewers from the midland counties of England, and disappeared, like the woodcocks, to some unknown region until the equinoctial gales and the first October snows drive the Englishmen to their hunting-boxes in the south. Then, again, like the woodcocks, the chieftains return to the ancestral fastnesses with some English cash to carry them through the winter, and an uneasy feeling that the hold which their fathers and their forefathers had upon their clansmen is somehow slackened, and that they are looked on even by the family henchman and the hereditary piper with something like contempt. The devotion of a Caleb Balderstone to the old family stock, and the contrivances of his inventive genius to keep up a show of splendor with an attenuated family purse, are plants of Lowland not of Highland growth. The Celt soon takes to his new Saxon and forgets his old Gaelic master. The summer lord is more open-handed than the winter one. He kept open house. He spent his money royally among the people. He did not enquire too strictly into little things. He wore as good a Highland costume, even if it was manufactured in London, as the real chief, and he was as good a sportsman. He knew no Gaelic, perhaps, and could not converse with the gillies in their native tongue. But what of that? He knew many things of which the ignorant Highlanders knew nothing, and he gave them clothes, and tea and tobacco, and whiskey and other good things, which the straitened means of their Celtic chieftain could hardly furnish for his own use. The feeling with which these Saxon invaders used to be regarded in the Highlands has materially altered. Twenty years ago, there was a wailing and a lamentation throughout the land as one Highland property after another changed hands from the old Gaelic stock to the new breed of rich Englishmen. "All the old Highland families are disappearing," it used to be said; "the country is going to the dogs." No one was regarded with less favor than the "English shentleman," who used to come with an unknown tongue and strange fantastic ways every summer to the moors. He despised the Highlanders, and treated them, not as friendly dependents, but as a degraded race, who spoke a tongue he did not know and did not know the tongue he spoke. Familiarity with each other's ways and customs has softened this feeling. The Highlanders, like most Celtic races, have a natural instinct by which they recognize their masters. They clung to the old race with a loyal tenacity so long as they clung to their land. But when their connection with the land was severed either by sale or lease, and a new race of landlords or shooting tenants took the place of the old one, such of the dependents as remained on the estate transferred their affections to their new masters, and became as faithful in their allegiance to the new as they and their ancestors had in times gone by been to the old.

And it is difficult to say that either the country or the people has suffered by the change. There is less poetry and less romance in the new relations, but it is only the result of natural processes which have been going on in the Highlands for nearly a century and a half. After the Rebellion of 1745, and the abolition of what was known as "hereditary jurisdictions," or the power of life and death possessed by each Highland chief in his own territory, the face of society north of the river Forth began to change. At that time the Highlands were thickly populated. A single chieftain, who now could not muster a couple of hundred retainers over his whole estate, could, even in the Rebellion of 1745, bring several thousands into the field. Every glen and every strath, almost every acre of cultivated land on the mountain-side, contained inhabitants—men, women, and children—who existed on the little croft around their hovels. They were people who did nothing from one year's end to another, when there was no fighting or thieving to be done, but cultivate rudely a patch of oats or barley to supply them with their oat-cakes, their oatmeal porridge, and their whiskey. They had cattle to drive from the Lowlands, sheep to steal, and deer to shoot, and fish to catch, and no one to find fault with them, and they reared up a race of young barbarians to follow faithfully in their fathers' footsteps. At the end of last and the beginning of this century, sheep-farmers from the south of Scotland began to take possession of the Highland hills. They hired them on long leases, of thirty and forty years' duration, from the owners of the soil, and with their landlords' consent they induced or forced the cotters to leave their homesteads in the mountains and migrate to the coast and to the towns. This was called "eviction" by the enemies of the farmers, and much ill-feeling—partly political, partly sentimental—was engendered by these proceedings. But nowadays it is generally admitted that the country has gained by these evictions, and the evicted have not lost. Many of the evicted were comfortably housed by the seaside, and taught the arts of honest living by fishing and other seafaring pursuits. Some found their way to Glasgow and Edinburgh, and the other towns of Scotland, and others crossed the border into England. Many emigrated to Canada, to the States, and to Australia and New Zealand, and, in not a few instances, their descendants have risen to eminence in these countries.

The sheep-farmers, however, have not had it all their own way in these latter days. Sir Walter Scott tells of an old Highland chief who used to say that owners of land at one time were valued for the number of men on their estates, and then it was for the number of cattle and sheep, and soon it would be for the number of rats. We have not got to the rat stage yet. We are passing through an intermediate cycle of game before we come to vermin. The rich Englishmen to whom I have referred have come down like locusts on the land. It is almost sad to run your eye down the columns of the Scotch Doomsday Book, published a year ago, and see the havoc made by the Southerners on the old Gaelic names. Macleans, and Mackenzies, and Camerons, and Mackays, and Campbells, and Macleods are giving place to Guests, and Bairds, and Fowlers, and Basses, and Malcolms, and Smiths, and Morrisons, and Ramsdens. These wealthy Saxons have bought up property after property as they came into the market, and at the expiration of the sheep-farmers' leases they have removed them and

their sheep to make room for red-deer, just as the farmers removed the cotters and their hovels to make room for sheep. The king of the forest—of the Scotch forest at least—is now supreme in his native hills and corries. He cannot brook the company of sheep or shepherd. They disturb his peacefulness and his sense of security and ease. "No beast of any consequence," a gamekeeper said to me the other day, "will remain on the ground if he is constantly to be annoyed by seeing shepherds and their dogs about the hill." If the ground is cleared of such annoyances to his comfort, he will remain, and he will afford most excellent sport during six weeks of each year—from the 20th of August till the 1st or 2d of October—to the owners of the mountains and the corries which he frequents. It has been estimated that upwards of 400,000 sheep have been displaced from the mountains of Caithness, Sutherland, Ross, Inverness, Perth, Aberdeen, and Argyll during the last twenty years, to make room for red-deer. Allowing five acres to each sheep, which is about the average calculation in farm-letting in those counties, it will appear that some two millions of acres are entirely given up to deer. You can walk the whole way across Scotland from Braemar in Aberdeenshire to the west coast of Ross-shire, a distance of perhaps 150 miles—a considerable distance in a small country like Scotland—without seeing a living quadruped except an occasional stag or hind or mountain hare. Forty years ago this was all under sheep or cattle. Now it is under deer, and it is kept under deer to provide six weeks' recreation for a couple of hundred wealthy Englishmen and their friends.

It is a question how far these vast clearances of men and sheep are censurable. Sensational newspaper writers in this country make a piece of work about them from time to time when there is nothing else to write about. Minor poets also profess to see material for poetic moaning in the ruined hovels and deserted crofts of the useless men and women who of old inhabited them. Occasional stump-orators make democratic capital over these transactions. But there is something to be said on the other side. The Highland climate, and especially the climate of the Western Highlands, is not adapted to the cultivation of corn, and the high mountains, which may be safely tenanted by red-deer, will not keep any stock of sheep. They pine and rot and die from exposure in places where deer are healthy. Black cattle and "West Highlanders" will exist and even thrive wherever red-deer live. But black cattle do not pay so well as deer. The rise during the last twenty years in the price of Highland properties which are suitable for deer is something unprecedented. The estate of Applecross in the west of Ross-shire was sold about twenty years ago by the old Highland family which had possessed it for generations for £135,000. A few years afterwards it was divided into three lots, and sold after the death of the purchaser, the Duke of Leeds, for £210,000; and one of these three lots was resold within seven years of the purchase for £120,000. It was sold again last year to Sir Ivor Guest, a rich iron-master, at a higher figure than the late Duke of Leeds gave for the whole estate only twenty years ago. The island of Harris, one of the remoter Hebrides, containing an excellent deer-forest, was sold in 1831 for £60,000, and five years ago the deer-forest half of it fetched £155,000. Another property, which I know myself, was bought for £30,000, and in seven years it was sold for £70,000, in consequence of the sheep having been removed and the ground converted into forest. These are but casual instances of the rise in value of these properties. It is no exaggeration to state that every Highland estate which is suitable for deer has doubled or trebled its selling value within the last five-and-thirty years.

When prices such as these are going, can any one wonder that the impoverished Highlanders should make hay when the sun shines, and sell their land, or turn it into deer-forests, and let it at gigantic rents? It is not in human nature to resist such temptations. How long the taste for the excitement of deer-stalking may continue it would be vain to attempt a guess. It is in full flow this season, and shows no signs of abatement. It has many drawbacks, but withal it is a manly and a healthy taste; and whatever may be urged against it on economic or on moral grounds, and no doubt a good deal can be urged, no one who has had experience of it will deny that it is the noblest sport that the British Islands afford.

## Notes.

G. P. PUTNAM'S SONS will publish this fall 'The Abode of Snow,' being observations on a tour from Chinese Tibet to the Indian Caucasus, by Andrew Wilson; 'Notes of Travel in Africa,' by C. J. Andersen; 'Travels in Portugal,' by "John Latouche"; in their series of 'Brief Biographies' the following: 'English Radical Leaders,' by R. J. Hinton; 'French Leaders,' by Edward King; and 'German Political Leaders,' by Herbert Tuttle; a new novel, 'Wych-Hazel,' by Miss Warner; 'The True Order of Studies,' by Thomas Hill; additional parts of Mrs. Greatorex's 'Old New York'; and other illustrated works, chiefly juveniles.——*Nature* for August 26 (a double number) presents its readers with a steel portrait of Sir Charles Lyell—one of that inspired series, as we may almost call it, which has been illustrated by heads of Faraday, Darwin, Tyndall, and Huxley.

—As we go to press, we learn with very keen regret of the sudden death of Mr. Chauncey Wright, at Cambridge, on Sunday last. Mr. Wright was one of the most valued contributors to the *Nation*, and one of the ablest writers on scientific and metaphysical subjects that this country has ever produced. His learning was only equalled by his modesty and gentleness, and one must go far to seek a more perfect exemplification of "sweetness and light." But of his characteristics as a thinker and critic, as well as of his personal and private qualities, we must defer speaking fully till our next issue.

—We have been favored with a copy of Mr. John F. Marthens's unpretentious 'Typographical Bibliography,' of which only a limited edition has been printed, and but fifty copies been put on sale (Pittsburgh). It aims to show those who are in any way connected with the manufacture of books "the resources there are in our own language towards a more general knowledge of the history and practice of the art of printing." In its actual scope it agrees nearly enough with Munsell's 'Catalogue of Books on Printing and the Kindred Arts,' which includes works on copyright, liberty of the press, literary property, bibliography, etc. Mr. Marthens admits not only Dibdin and Lowndes, but Allibone and Disraeli, and ranges from the magazine article to the most elegant or most ancient bound volume. Thus we find entered 'The Harper Establishment,' by Jacob Abbott; Edward H. (misprinted K.) Knight's Centennial paper on Printing in the March *Harper;* Wilson on Punctuation; Frederick Hudson's 'Journalism in the United States'; James Grant's 'Newspaper Press'; Sampson's 'History of Advertising'; H. T. Brown's 'Manufacture of Paper from Wood in the United States'; Woolnough's 'Art of Marbling'; Sotheby's 'Facsimiles of Water-marks used by the Early Paper-makers'; Nicholson's 'Manual of the Art of Bookbinding'; Hugo's 'Bewick Collector'; Ruskin's 'Ariadne Florentina'; and, to bring our selections to an end, Chatto's 'Facts and Speculations on the Origin and History of Playing-Cards.' The oldest work mentioned in this catalogue is Thomas Churchyard's 'Descriptive and Playne Discourse of Paper' (1558). We observe but one book descriptive of a type-setting machine, viz., Owen L. Brown's, 1870, and suspect that there have been some omissions in this department. Johnson's 'Introduction to] Logography; or, The Art of Arranging and Composing for Printing with Words Entire, their Radices and Terminations, instead of Single Letters,' dates back to 1783, though ever since that time fruitless efforts have been made to bring such a system into use. Milton's 'Areopagitica' finds a place with an anonymous 'Dissertation upon the Constitutional Freedom of the Press in the United States of America,' by an Impartial Citizen; and Franklin's Autobiography paves the way for the 'Autobiography of a Journeyman Printer,' and for Brenton's 'Voices from the Press: a Collection of Sketches, Essays, and Poems by Practical Printers.' Mr. Marthens's bibliography, imperfect as it probably is, is a useful compilation, and ought to incite not only "practical printers" but amateurs with taste and money to the highest efforts of which the typographic art is capable.

—Since the panic the financial articles of the newspapers have contained a great deal of statistical information with regard to the exports, imports, and internal trade of the country, affording comparisons as to the prosperity of the country for a series of years. There is no doubt that when these statistics are intelligently given they are of value; but they are given in all sorts of ways. To take one or two examples, the statistics given of the progress of railroad-building, by the number of miles constructed from year to year, showing a steady falling-off from the year of the panic to the present time, in so far as they go are valuable, because we have a common standard of measure, the mile. But when we come to the comparison of the number of dollars' worth of manufactures produced or sold in a particular trade, we are met by two difficulties—first, the fluctuation of the currency (which has been no less than ten per cent. since the panic), and, second, the fluctuation of general prices. For instance, if we know that so many millions of yards of cloth were sold during 1873, 1874, and 1875, we can easily see whether production is reduced or not; but if we only know that so many million dollars' worth of cloth was sold, we have to reduce all the values to gold, and have even then to take into account the general depres-

sion of all values owing to moral causes. That is to say, an identically equal number of exchanges in 1875 and 1873 may be represented by totally different pecuniary sums. Of course, in most cases statistics are so little looked after that it is impossible to get the real number of exchanges or transactions in any common measure, and we must be contented with what we can get; but it should not be forgotten that the comparisons made every day in the newspapers are subject to these deductions from their accuracy, and that if we could get at the real business of the country we should probably find, as is indicated by the steadiness of the railroad traffic in most quarters, that it is not so very different from what it was two or three years ago as the depression in speculative kinds of property—as, for instance, real estate—would lead us to imagine.

—The two versions of Jules Verne's well-known extravaganza, the 'Tour of the World in Eighty Days,' which have been put on the stage at the Grand Opera-House and the Academy of Music, are radically different performances. The latter is a Porte St. Martin spectacle, pieces of the play being sandwiched in between ballets and astounding Oriental processions, until the spectator begins to forget whether it is a spectacle with dramatic interludes or a play with spectacular accompaniment that he is witnessing. This is a drawback in the case of a play which, being fundamentally preposterous, requires, if any does, rapid acting to make it seem worth doing at all. On this account, the Opera-House version was preferable, and it was made not less so by the introduction of an extraordinary American character (we do not recollect whether he makes his appearance in the book or not), a sort of idealized rough, who, having received an imagined affront from Phileas Fogg, in not being allowed to become a member of the Eccentric Club, pursues the latter round the world, intent at first on taking his life, and, with that object, fighting a duel with him at every convenient stopping-place, but afterwards swearing an eternal friendship, and helping the Englishman to rescue the unfortunate Indian princess, as well as a sister of hers, conveniently introduced in order to provide a wife for the American. The somewhat international character of the burlesque gives room for some of the most novel and startling adaptations or "conveyances" of current theatrical sentiments that we have ever had the pleasure of hearing. In the crisis of the story we have the American counteracting the gloom of his English brother, who declares that something "can't be done," by lifting his hand on high and protesting, with a slight modification of Bulwer's phraseology, "In the bright lexicon of *our* race, there's no such word as can't be done." On another occasion, the Briton forbids something or other—the suttee, if we remember right—by exclaiming, "In the name of the Queen, I forbid this to go on"—which the American immediately improves upon in this semi-political fashion, "In the name of Liberty, Humanity, and Progress, I put my veto upon these proceedings." It is curious, by the way, to notice the utter impossibility which seems to attend all attempts, even in burlesque, to put an English gentleman on the stage with us. Both at the Academy and the Opera-House, the Frenchman, the African, the American, and even the Brahmin were better than Phileas Fogg, who was, indeed, no more like an Englishman than he was like a Hottentot.

—A sensible writer in the *Weser-Zeitung* opposes the new-born zeal which animates some of his countrymen in their *Fremdwörterjagd*, or crusade against words of foreign origin discovered or discoverable in the German language of to-day. He reminds these purists that they assume, in both cases erroneously, that the Germans are the only people who take in words from abroad, and that the German tongue is rich enough to dispense with such borrowing, or, in other words, is able to translate every foreign word with an equally good German one. Under the first head he points out the vast indebtedness of French and English to foreign sources. A single page of the *Revue des Deux Mondes* furnishes a list like this: *la diocèse, dogmatique, hypocrisie, problème, économie, physiologique, philosophique, la métaphysique, apologie, éphémère, phraséologie, stoïcien, caractères, idées, critique; le postulat, sidéral, scientifique, critique, puéril, virilité.* The last five might appear to be genuine French, inasmuch as the French language is derived from the Latin; but in fact they do not (as do *père, mère, fils, maître, mourir*, etc.) have their root in the Latin, or the Latin patois which made its way into Gaul, but were bodily "lifted" from the dead Latin long after the French language had been established. This transfer was not a popular or national development of speech, but (as in the case of the recent glorification of Arminius, a forgotten popular hero) was the work of literary and learned men, as is proved by their classic form, and the absence of all the marks (except in terminations) of unconscious word-formation, like that which educed *père* from *pater*, etc.; by the isolated position of the borrowed words in the vocabulary, so that, *e.g.*, to the native French understanding *virilité* connects itself with no explanatory *vir;* and by such examples as the adoption of *érudition* to supply an abstract for the concrete term *savant*—a native product. The English language of course swarms with examples of the same thing, and being able to measure itself in richness with the German or with any other speech, refutes the plea that it is all very well for the French to borrow because it is a poor language. That the German contains a great number of home-made expressions for abstract ideas is due to the necessity of making intelligible to barbarians the doctrines of Scripture. If we could suppose Christianity to have been introduced at the time of Frederic the Great, it is certain that the Germans would have adopted without hesitation the Latin terminology of conversion, justification, resurrection, mediator, etc., etc. The precision of meaning which attaches to the foreign interloper, and the consequent gain in rapidity of thought, greatly favor it in the struggle for the survival of the fittest, and in Germany it very seldom entirely gives way to the home-made equivalent.

—The Library of the German Reichstag (a scientifically-formed "Library of Congress") is reported to be making fine progress under the skilful direction of Dr. Potthast, and to take rank already among the foremost libraries of Berlin. It now numbers some 40,000 volumes, and is steadily increasing. Dr. Potthast has divided it into twenty-three sections, and many of these make a near approach to completeness. That allotted to the Civil Process contains the collected statutes of all the German states, and even the American and Turkish. Under Political Science one may consult the most important German public documents, the proceedings of the several German Landtags, the protocols of the Bund, the proceedings of the Swedish Assembly, Hansard in full, and, thanks to the active interest of Dr. Kapp, a complete set of the Congressional Globe, together with Force's Archives, etc., etc. With lexicons and the leading periodicals of the day, not excepting the *Civiltà Cattolica*, the library is also well provided, while its internal appointments satisfy every requirement of comfort and convenience on the part of the deputies who resort to it.

—The last number of the *Rivista di Filologia Romanza* (Vol. II., Fasc. II.) contains an article of especial interest to students of old Italian literature and palæography. One of the oldest monuments of the language, it will be remembered, is what is called the 'Ritmo Cassinese,' a poetical composition, preserved in the library of the famous monastery of Monte Cassino. It has been published a number of times, but never with the care and thoroughness of the present attempt, which is accompanied by a chromo-lithograph fac-simile of the entire document, and a full investigation of its palæography, grammar, metre, and lexicography. Although the handwriting is that of the eleventh century, the editors do not hesitate to pronounce the composition of later date, and place it in the twelfth or possibly in the early part of the thirteenth. The contents of the poem are very obscure, and it seems doubtful whether it is a satire on or an apology for the Order of St. Benedict. The metre is the same as that of the 'Dies Irae,' with the addition of a *cauda*, or three half lines of eight syllables rhyming together. Other valuable articles are: A canzone of the fourteenth century from a MS. in the Barberino Library, edited by Mussafia, and forming a sort of continuation to his previous studies of the Italian dialects of the fourteenth century; general alterations (assimilation, dissimilation, gemination, etc.) in the Italian language, by N. Caix; and some fragments of a free translation of the Book of Maccabees into old French decasyllabic verse, published by E. Stengel for the first time from a MS. of the Berne Library. In addition to these interesting articles, there are reviews of books, bibliographical notices, etc. We are glad to see that this excellent periodical is to be published henceforth by Loescher & Co., and is to appear more regularly than heretofore.

—Some recent numbers of the *Annals of the Propagation of the Faith* have furnished the *Pall Mall Gazette* with reports from missionaries in Western China which present their labors in any but an encouraging light. A long list of disasters, provoked by the successes obtained by the missionaries, is observable in the last report of Monsignor Pinchon, Vicar-Apostolic of Western Sze-chuen, the province adjoining Yunnan. The fact that seven or eight thousand neophytes had embraced Christianity in the northern part of the province "roused the fury of the literati, the officials, and the mayors of the market-towns, who, having collected together a number of lewd followers of the baser sort, attacked the convents of the city of Chuen-kin-foo, sacked and destroyed the oratory and pharmacy, and robbed, beat, and seriously wounded several hundred Christians." At Pa-chow the national guards broke into and burned the Christian stations, drove the converts shelterless out of the city, and set a price on the head of the parish priest. In the district of Su-lin-hien, a band of mountaineers, instigated by the prefect, suddenly fell upon three of the stations and burned the

buildings, and three of the neophytes, preferring death to apostasy, were murdered. At Lin-shwuy, where the converts had increased to nearly 4,000, owing to the official toleration, the national guards rose against them, killing some, wounding others, and destroying the property, both corporate and individual, of the converts. From another part of the province, news has been received of the martyrdom of five converts, while more than 1,500 neophytes were everywhere pursued, and dragged on a miserable existence, concealed in the mountains or wandering in unknown lands. In Hoo-pih, however, owing to the influence of the mandarins, a cross which, with doubtful expediency, had been erected on the site of a ruined temple, and "which was some time ago razed to the ground by the natives, has recently been replaced with considerable ceremony in the presence of the mandarins of the district and of 140 soldiers accoutred in the European fashion." The Pro-Vicar, too, on his arrival at Pa-tum, exults that the neophytes, on his arrival, with the sound of fifes and drums and the explosion of fireworks, conducted him on horseback "in triumph to the church." In the province of Kwei-chow, the storm of persecution which swept the districts in 1869 is much abated, and the Vicar-Apostolic reports that in a recent tour through his diocese he repeatedly received similar honors to those paid to the high mandarins. Native public buildings, both secular and religious, have also been converted into churches and schools. But these are signs rather of indifference to popular prejudices and to the jealousy of the native dignitaries than of a solid if modest progress.

—No series of rulers in history has come down with so evil a reputation for wanton cruelty and tyranny as the four successors of Augustus, but of late this has been extenuated or explained as being really insanity, heightened by and taking its special shape from the possession of irresponsible power—a view which is well presented by De Quincey. A German physician, Dr. Wiedemeister, has undertaken to analyze this family insanity in a work entitled 'Der Caesarenwahnsinn der Julisch-Claudischen Imperatorenfamilie.' The special point made by him is in tracing this predisposition to a succession of intermarriages between near kin, while it took its special character from the varying circumstances of the several individuals. With Tiberius, "the unfortunate offspring of a double consanguineous marriage," it assumed the form of melancholy and suspicion. Caligula—a Julius as well as a Claudius—was epileptic, and his mental weakness was developed by sickness (in the eighth month of his reign) into monomania and complete insanity. Claudius was idiotic. The peculiarity of Nero's mental disease was its periodicity; his times of madness were three in number, each continuing two years and a half, commencing in April, 59, autumn, 62, and autumn, 65. They began and ended in melancholy, culminating in frenzy. These are the principal points of Dr. Wiedemeister's theory; it is new, and unquestionably has some truth in it, although he appears to have been not sufficiently critical in the authorities he has followed.

## BANCROFT'S NATIVE RACES OF THE PACIFIC STATES.*

### I.

WHEN a work is so extensive and elaborate that it must be published at intervals, in separate and nearly independent volumes, it is the privilege of the periodical press, in distinction from the daily newspaper, to review it at leisure, and perhaps to defer a careful notice of it until its issue is somewhat advanced. We have pursued this course in reference to Mr. H. H. Bancroft's work on the aboriginal peoples of the Pacific slope. If carried out as designed, it will fill between three and four thousand large octavo pages, constituting an extended and in some respects an exhaustive treatise upon the native races of Western America. Two bulky volumes of the projected series of five are now before us; and it is quite time that some account of Mr. Bancroft's ethnological labors should appear in our columns, with an impartial estimate of the quality of his book so far as published.

Until the announcement of the present work, Mr. Bancroft was known to the literary public only as a San Francisco bookseller. As early as 1859, however, he had formed the design of producing "a series of works on the Western half of North America," and, making use of his special facilities as a dealer in books, had begun to collect a library relating to this special field. In 1869, he had succeeded in bringing together some sixteen thousand books, maps, and manuscripts; and, being thus fully equipped for his gigantic undertaking, and reinforced by several capable assistants, he began in good earnest the composition of this first book of the projected "series." The account given in the preface of the inception and progress of the work reveals in a very pleasant way the truly Californian enterprise, courage, and local patriotism of the author and his co-laborers. The field traversed by Mr. Bancroft—the "Pacific States of North America"—is one that would scarcely have been selected by any other than a Californian author. From an ethnographical point of view the selection seems quite arbitrary, and the territory lacks that homogeneousness which encourages a complete and artistic treatment of a subject. The author seems to feel this, but he recognizes a tendency to unity throughout this wide field, and satisfies himself by this subjective view of it. He says:

"Although hitherto its several parts have been held somewhat asunder by the force of circumstances, yet are its occupants drawn by nature into nearness of relationship, and [they] will be brought yet nearer by advancing civilization; the common oceanic highway on the one side, and the great mountain ramparts on the other, both tending [*sic*] to this result. . . . Although there may be apparent heterogeneity in the subject thus territorially treated, there is an apparent tendency toward ultimate unity (pp. vii., viii)"

By the term "Pacific States" is designated the entire territory bordering on the Western ocean, from Alaska to Darien. The object of the work before us is to give a full and impartial account of the native inhabitants of this vast region as they were found at the time of its discovery by Europeans. As "three hundred and thirty-six years were occupied in the discovery of the western border of North America" (p. 26), it is obvious that the accounts of the various tribes and nations embodied in the work must bear quite different dates—some of the native races being portrayed as they appear to-day, others having actually become extinct one or two centuries ago, and existing now only in the quaint description of some old voyager or missionary. But such information as our author has he gives us without stint, culling his facts alike from the oldest and the latest authorities, from Spanish priests and Californian adventurers, from British fur-traders and German savants, from historians, from ethnologists, and from travellers. Never was a large library more thoroughly ransacked or more completely laid under tribute by a writer, than was Mr. Bancroft's collection of "Americana" in the preparation of this work. Although partly historical, the book could not properly be called a history; it is rather an ethnological treatise. But ethnology is a broad and complex science, and the author's plan involves several distinct surveys of the entire field. He traverses it first ethnographically; that is, he describes the various races in their characteristic features, just as they appeared to Europeans when first visited. He goes over it a second time, to give an account of the religions of these races; his third survey of the field has reference to their various languages; and the fourth to their antiquities, especially their architectural remains. This is followed by another exploration, in which he gathers together whatever is known of their migrations and their primitive history. We have, therefore, within the five volumes as many distinct treatises in ethnography, mythology, linguistics, archæology, and historical ethnology. To win success in any one of these departments would be no slight achievement; but Mr. Bancroft—if we may judge from his first two volumes—has performed a great deal of thorough work, and secured valuable results in all of them.

The more strictly ethnographical portion of the work occupies the two volumes now under review. The mythology and languages of these nations are considered in the third volume, their antiquities in the fourth, and their aboriginal history and migrations in the fifth. The races described are grouped in two great divisions—the "wild tribes" and the "civilized nations." The first volume, which is occupied with the wild tribes, traverses the whole field territorially; the second, which is confined to the civilized nations, is limited territorially to Mexico and Central America; for it was only within these countries, of all on the Pacific slope, that a native American "civilization" was at any time developed. Confining our attention for the moment to the first volume, we find that it consists of an ethnological introduction and six very full chapters, devoted respectively to the following groups of peoples: 1. Hyperboreans—the nations whose territory lies north of the fifty-fifth parallel; 2. Columbians, who dwell between the fifty-fifth and forty-second parallels, and whose lands, to some extent, are drained by the Columbia River and its tributaries; 3. Californians and the inhabitants of the Great Basin; 4. New Mexicans, including the nations of the Colorado River and Northern Mexico; 5. Wild Tribes of Mexico; and, 6. Wild Tribes of Central America. In Chapter II., the author takes up the Hyperboreans, and an account of his method here will give us a correct idea of his method throughout the volume. The chapter occupies a hundred and fifteen pages, and describes (1) the Eskimos, (2) the Koniagas, (3) the Aleuts, (4) the Thlinkeets, and (5) the Tinneh. After a brief but vivid sketch of the physical features of the broad domain occupied by these nations, a detailed account is given of the Eskimos in their geo-

* 'The Native Races of the Pacific States of North America. By Hubert Howe Bancroft.' Vol. I.: Wild Tribes: pp. xlix.-797. Vol. II.: Civilized Nations; pp. x.-805. New York: D. Appleton & Co. 1875.

graphical position, their tribal divisions, their physical characteristics, their dress, dwellings, food, employments, property, family relations, customs, amusements, diseases, etc., etc. Then follows a similar account of the Koniagas, in which the same points, as nearly as possible, are gone over, the topics this time being as follows: Tribal subdivisions, location, territory and climate, physique, dress, houses, food, employments, war customs, implements, government, domestic manners and morals, superstitions, and burial customs. The Aleuts are next described—the same ground being traversed again—and then the two remaining peoples, the Thlinkeets and the Tinneh. All this is followed at the end of the chapter by twelve pages of fine print, devoted to a more definite account of "tribal boundaries." The names of the various tribes composing each "nation" are given in full, together with the most minute geographical descriptions, supported by profuse references to the various authors who have described these peoples, or referred to them in the slightest way. In Chapter III., the same routine is followed in describing the second great group of races, the Columbians. In the thirty pages at the end devoted to an account of tribal boundaries, there must be several hundred tribal names enumerated, and as many references to travellers, philologists, and other authors. These geographical sections of the first volume have all the minuteness and completeness of a gazetteer, and possess about the same degree of interest for the general reader.

This method of treatment, carried through all the eight hundred pages of the volume, certainly produces a strong impression of sameness. The hasty reader, having glanced through one or two chapters, will be likely to say to himself, "Ex uno disce omnes," and to lay aside the portly volume for something lighter and more diverting. The author seems to have feared such a verdict, for he says in his preface: "There may be an appearance of repetition [in the first volume], but I trust this may be found more apparent than real. Although there are many similar customs, there are also many minor differences, and no delineation has been repeated where a necessity did not appear to exist" (p. xi.) In this as in every other respect he has been loyal to his design—namely, not to theorize, but to collect and report facts, and to do this in the fullest and most accurate way. He would have found it far easier to attract the attention of the multitude by proclaiming on his title-page some new-fangled hypothesis in relation to the origin of the American races, and constructing his book so as to support it by facts picked out here and there from the mass of recorded information; but instead of this he has confined himself to the less popular but more useful task of "gathering and arranging in systematic, compact form all that is known of these people." And for this he deserves great credit; for the course pursued is one which, on the one hand, requires no little self-denial, and, on the other, produces in the long run the most valuable results. What is most wanted to-day in the domain of ethnology, and especially in the American field, is diligent work, with this as a dominant purpose: to convert the study of the human race (as some one has expressed it) from a branch of speculative philosophy into a branch of positive science. As the German ethnologist, Dr. A. Bastian, so constantly insists, one of the vices of modern science is the proneness to build imposing theories on imperfectly ascertained data. It is a mistake which students of American ethnology have very persistently committed, from the days of Grotius, or, in fact, of Columbus, until now; and, if we may judge from the wild vagaries of some of the latest writers, it is an almost incurable vice. It is a comfort to find that Mr. Bancroft recognizes, what ought to be obvious to all, that the accumulation of materials should precede the building-up of a theory. He expresses a very humble estimate of his labors, or rather of his function, saying that his "is the labor of the artisan rather than the artist, a forging of weapons for abler hands to wield, a producing of raw materials for skilled mechanics to weave and color at will." But he knows as well as any man that such work as this, at the present stage of ethnological research, is the highest, because the most timely and useful. What he has done for the Pacific slope is what just now requires doing on the largest scale for the entire continent. Let us first have all the ascertainable facts, and let the solvent theories be brought forward with due modesty afterwards.

Such being our author's aim, all that can be fairly asked of him is thoroughness in his report of accessible facts, and if possible a broad but simple scheme of classification. If he had chosen for his "public" the very limited class of scientists who are likely to make use of his facts and work them up, and had composed his book accordingly, no one could have blamed him. But, instead of this, he has written for the people, and produced a highly interesting work. He not only opens to the reader a mine of materials, he raises before his eyes a shapely fabric. Partly because of its literary and æsthetic qualities, but chiefly because of the novelty and freshness of the facts, this account of the wild tribes of Western America is readable throughout, and in some places fascinating. The tribes of the Atlantic coast and the Mississippi Valley have been so fully described in popular compilations that their history and customs are tolerably well known to the average American school-boy. But here the reader enters a new field, and is surprised and interested at each step by some physical or mental trait, some curious social custom, some startling virtue or vice, of a people of whose very existence, perhaps, he was previously unaware. How interesting, for example, is the detailed account (pp. 227–8) of the strange custom of flattening the head, which prevails among the Chinooks and other nations further north. "Failure properly to mould the cranium of her offspring gives to the Chinook matron the reputation of a lazy and undutiful mother, and subjects the neglected children to the ridicule of their young companions; so despotic is fashion." How strange, again, in the account of the Mosquito Indians (p. 744) is the practice attributed to widows, and how uncivilized the devotion thus exemplified: "Widows, according to some old writers, after supplying the grave with food for a year, take up the bones and carry them on the back in the daytime and sleep with them at night for another year, after which they are placed at the door or upon the house-top," which last is probably equivalent to the civilized custom of stowing away the portrait of a "deceased partner" in the garret. How unique, again, are the regulations which prevailed in ancient Nicaragua for the government of the markets (II. p. 737): "*Men* could not visit the market-place of their own town, either to buy or sell, or for any other purpose; they even incurred the risk of receiving a sound beating if they so much as peeped in to see what was going on. All the business was transacted by the women." Again, how useful it would be to an able lawyer, if making a dissertation, for instance, upon the word "cuckold," to know that "in some parts of the [Aztec] empire the husband who cohabited with his wife after it had been proved that she had violated her fidelity, was severely punished" (p. 466); and, on the other hand, how convenient for quotation by the opposing counsel would be this statement relating to the ancient Mayas (p. 673): "It sometimes happened that the husband did not report the matter to the authorities, but gave his unfaithful wife a bird of a kind which was used in sacrifices, and told her to offer it to the gods, and, with her companion in crime, to confess and be forgiven. Such a husband was regarded as a most virtuous and humane man." And finally—not to cull too many items—what a godsend it must be to the humorists of the provincial press to learn (I. p. 351) "that a Modoc may kill his mother-in-law with impunity" "Of late years," your humorist will exclaim, "these Modocs have been looked upon as a hard set; but let us bear in mind that there is no race or tribe, however low, but has its redeeming traits!"

Mr. Bancroft's first volume, while possessing, as we have remarked, not a few popular characteristics, is nevertheless somewhat too heavily freighted with geographical and other details, with comparatively trivial items in the text, and multiplied references in foot-notes, to become a really popular work. Not less than a hundred and twenty pages in small type are devoted to a description of tribal boundaries; and the body of each chapter is frequently too much like these supplementary portions, in the dryness of the details, to be very attractive to ordinary readers. But when we pass to the second volume of the work we enter a quite different realm, and find ourselves in a different literary atmosphere. To this second volume we propose to do justice in our next issue.

## ASSYRIAN HISTORY.*

THE series to which this little volume belongs seems destined to prove that the qualities requisite for original research are not often combined with the ability to communicate the results of research. A few weeks since we noticed Dr. Birch's 'History of Egypt,' finding in it much to condemn, but little to praise; we regret to say that Mr. Smith's 'Assyria,' though not marred by some of the more glaring faults of its predecessor, has little to merit positive approbation.

Mr. Smith is known as one of the most ardent and successful of a band of scholars who have opened a new chapter in human history. It is scarcely thirty years since Sir Henry Rawlinson, by publishing to the world his copy and translation of the great Behistun inscriptions of Darius Hystaspes, gave the key to the strange cuneiform characters used of old in the basin of the Euphrates. The success with which his labors have been followed up is one of the creditable triumphs of modern scholarship, and through it we are rapidly obtaining an intimate knowledge not only of the annals

* 'Ancient History from the Monuments. Assyria, from the Earliest Times to the Fall of Nineveh. By George Smith.' 1 vol. 12mo. New York: Scribner, Armstrong & Co. 1876.

but also of the literature and institutions of one of the primitive civilizations of the world, affording material of incalculable interest to complete our records in many departments of human progress. The inseparable relations, moreover, of Chaldea and Assyria with the origin and history of the Jews lend unsurpassed interest to the fragmentary tablets and inscriptions so strangely disinterred and deciphered after an oblivion of three or four thousand years; and the public at large was quite ready to share the enthusiasm of the learned when, two or three years ago, Mr. Smith discovered in the British Museum, and completed by excavations at Kuyunzhik, the Deluge Tablets, or Legends of Izdubar, which so remarkably confirmed the accuracy of Berosus in recording the traditions of his race, and presented such startling points of difference and concord with the Mosaic history.

A book which, within a moderate compass, should give a clear and connected view of what has been won to historical knowledge from the cuneiform inscriptions, elucidated by what is known from other sources, would be a boon for which the public might reasonably be grateful; but this Mr. Smith has not given us. Construing his task in the strictest sense, he has written "the History of Assyria from the monuments," and nothing else, and thus has presented us with a bald and lifeless collection of details, from which all that is most interesting is carefully eliminated. The history of Babylon is so closely connected with that of Assyria by the identity of the dominant Semitic race, by the community of language, religion, and institutions, and by the alternate supremacy of one region over the other, that separation between the two is incompatible with satisfactory treatment of the history of either. In fact, they are so generally classed together that we naturally expected Mr. Smith's volume to contain a condensed view of Mesopotamian history as a whole. In this we are disappointed, and the fragment here presented is a mistake in a double sense—in its conception and in the order of its appearance.

The absurdity of endeavoring to treat the countries separately is manifested at the very start, where Mr. Smith states (p. 22), as the first positive fact known of Assyria, that it was governed in the XIXth century B.C. "by a ruler named Ismi-dagan." Now Ismi-dagan, as shown by an inscription published elsewhere by Mr. Smith himself, was a Chaldean potentate, "supreme over Ur and Eridu, king of Sumir and Accad." Yet in the text before us nothing is said to show that under him both countries constituted a single empire. But if Nineveh is to be treated thus separately from Babylon, the history of the elder sister should precede that of the younger. That Mr. Smith proposes to write a work on Babylonia is to be inferred from a remark on p. 52, and, if he does so, we trust he will give us what is needed to the proper understanding of the present volume—a résumé of what is known as to the origin, the arts, the literature, and the institutions of the various races, Turanian, Semitic, and Aryan, who so strangely came together in the land of Sumir and Accad, and whose wonderful civilization has so powerfully influenced the world from the dawn of history down to the present time. Of all this we have nothing here save a brief introductory chapter, which is unsatisfactory in the extreme, and another near the end on the buildings and library of Assurbanipal.

In fact, the work consists of little more than a dry paraphrase of the inscriptions in which the Assyrian conquerors were wont boastfully to record their successive campaigns. A literal translation of these documents has an interest from the wild, poetical strain in which they are conceived and the insight they afford us into the habits and modes of thought of the period; but, when stripped of these attractions and reduced to a catalogue of the rude tribes and ruder chiefs, for the most part impossible of identification, whom Sargon or Esarhaddon or Sennacherib overthrew and stripped of their herds and treasures in forays which were often scarcely more than cattle-lifting raids, they are of little interest to the general reader, and possess little value for the historical student.

Yet of such material is a large part of the volume composed, and so strictly does Mr. Smith construe his duty to adhere to the "monuments" that, except an occasional reference to parallel passages in Scripture and a few paragraphs relative to Assurbanipal's campaigns in Egypt and the conquest of Nineveh by Cyaxares and Nabopolassar, he seems to reject on principle all information from other sources that would throw light upon the subject in hand. Thus the Egyptian domination over Babylon and Nineveh is naturally not a subject that would be chronicled in Assyrian inscriptions, and yet ought not to be passed over in silence in a history of Assyria. That Assyria was tributary to Egypt, with occasional intervals, at least from the time of Thotmes III. to that of Rameses II., or from the XVIIth to the XIIth century B.C., is a fact as well ascertained as any other in the annals of those distant times; but it is recorded by the Egyptians and not by the Assyrians. Mr. Smith accordingly passes it over virtually in silence, giving no intimation that Assyria ever felt the yoke of an Egyptian invader, beyond the remark that "the armies of the Pharaohs . . . sometimes advanced to Nineveh," though the subsequent triumphs of Sennacherib and Esarhaddon are duly blazoned forth. Indeed, as though to show his contempt for Egyptian archæology, Mr. Smith more than once (pp. 104, 109) speaks in true Scriptural style of "Pharaoh, king of Egypt," as though "Pharaoh" was a proper name.

In the same way, he positively asserts that "we know nothing" of the events which led to the downfall of Assur-nirari II. (Sardanapalus) and the accession of the new dynasty of Tiglath-Pileser II., making no allusion to the generally received account of the attack on Nineveh by Cyaxeres the Mede and Phul of Babylon, nor giving any reason for discrediting it.

The book being thus little more than a classified arrangement of the purely historical inscriptions and tablets deciphered to the present time, has its value for students who desire to possess, in a compendious form, the absolute results of contemporary investigation into the names and deeds of the Assyrian monarchs, but this value is seriously impaired by the absence of all explanation as to the uncertainty of Assyrian nomenclature. The phonetic values of the cuneiform symbols are still but imperfectly understood, and it is only about six months since that Mr. Smith himself announced that it would be proper in some cases to read the name of the Moon-god as "Agu" in place of the received form "Sin," and that this syllable would accordingly have to be changed in the composition of proper names, which, among the Assyrians, were so frequently compounded from the names of deities. This uncertainty as to the form of Assyrian names is a serious stumbling-block to the student, and Mr. Smith would have done well to devote a page or two to explanations whereby the reader could identify persons and places as rendered by different authorities. Mr. H. Fox Talbot, for instance, gives as *Khaluli* the name of the battle-field where Sennacherib routed the Babylonians and Elamites, while Mr. Smith renders it *Hulule*. The Rev. A. H. Sayce, in his translation of the inscription of Rimmon-nirari gives Bel-sumili-capi as the name of the founder of the Assyrian monarchy, while Mr. Smith uses the form Bel-kapkapu. M. F. Lenormant writes as Samas-bin, Binlikhous, and Assouredilili the monarchs whom Mr. Smith transliterates as Samsi-vul, Vul-nirari, and Assur-dan—forms which are not easy of reciprocal identification. These are difficulties in the path of the student which Mr. Smith is thoroughly qualified to remove, and to which he would do well to pay attention in a second edition.

It is perhaps too much to expect the graces of style from a scholar whose days and nights are passed in solving the abstruse problems presented by thousands of fragments of clay tablets and cylinders inscribed with the enigmatic and almost illegible cuneiform characters, and yet, when the reader is asked to pick his way through such sentences as—"Yavan now set to work to raise a confederacy against Assyria, and led the Philistines to revolt, and joined with Judah, then ruled by Hezekiah, Moab, and Edom" (p. 109); or this: "Muttallu, King of Kummuha, who had revolted against Assyria, and trusted to Argisti, King of Ararat, but when the Assyrians advanced against him, Argisti did not help him, and he fled and left his country, which was reduced to the condition of an Assyrian province, and peopled by the prisoners from Bit-yakin" (p. 112)—he may reasonably suggest that when such scholars are requested to work for the public at large some ordinary critic of English could be profitably employed to revise the MS. and reduce to order the struggling mob of vocables.

In the interest of the reader, we would also protest against such books being issued without any of the usual facilities for reference. If an index or even a table of contents is too expensive a luxury, at all events the "running head" at the top of the pages might be economically used to give some indication of the contents, and aid the student in finding his way. Two hundred and two repetitions of the words "History of Assyria" is a poor compensation for the absence of every means of referring to the mass of details crowded together within the covers of the volume. It is, moreover, an injustice to the author of a work on a subject so rapidly growing, for the publishers to anticipate by nearly six months the date of 1876 on the title-page, especially when there is no date to the preface.

Mr. Smith, we believe, has just started on another expedition to the ruined cities of Mesopotamia. Grateful for what he has accomplished in the past, we wish him abundant success, and trust that his next appearance will be in announcing fresh and important accessions to our knowledge of Assyrian history, rather than in repeating efforts like the present, which he can well afford to leave to more skilful workmen and less patient scholars.

*The Bric-à-brac Hunter;* or, Chapters on Chinamania. By Major H. Byng Hall. (Philadelphia: J. B. Lippincott & Co.)—The frontispiece to this volume represents the bric-à-brac hunter, who, as we may fairly suppose, is none other than the author, seated in a room filled to overflowing with the glorious spoils of his campaigns, which, as he tells us at page 14, "are to him as are his scalps to the Indian warrior," trophies of victory. His air of indifference indicates, if we may hazard the conjecture, that, like most collectors, he is so fully convinced of the genuineness and great value of the Oriental porcelain, pictures, clocks, tabourets, carved cabinets, etc., etc., with which he is surrounded, as to be careless of the world's opinion. That they are the choicest of the choice, and that consequently if by some untoward chance they should be thrown into the market, amateurs of bric-à-brac would pay fabulous sums for them, we do not permit ourselves to doubt; but, if this be the case, we could wish that the book in which the Major tells us about some of his journeyings in quest of them were a little more of their quality, as it would have been had it contained less sketchy gossip, not quite so many stories without point (such as that in Chapter VI. about the Palissy dish, which fills seven pages and has no dénouement), and none of certain jokes which, like the fish in the negro story related at page 230, have been out of the sea so long that they have grown somewhat stale.

The several chapters headed Stamboul, Berlin, Dresden, St. Petersburg, Paris, London, etc., etc., contain some of the author's experiences as a bric-à brac hunter in these cities; histories of such famous porcelain manufactories as those of Meissen, Capo di Monte, Doccia, etc., etc, and of their founders; and dissertations upon travelling as it was and as it is, with other digressions not always intimately connected with the subject-matter. We find nowhere any such graphic picture of an old curiosity-shop as we had hoped for, and miss the familiar names of such renowned dealers—the aristocracy of their craft—as Alessandro Castellani, Baslini, Feuardent, and others whom we might mention. These omissions are hardly made up for by the names and addresses of a few sellers of bric à-brac at Marseilles, St. Petersburg, and other cities, or by the long story of the grocer at Rome (p. 203) who sold the articles of his trade in the lower story, and Wedgwood cups above-stairs. We are tempted to believe that Major Byng Hall, staying at Rome but a few days, never found his way to the doors of Depoletti or Basseggio, and that he left the city before it had begun to bewitch him as it does all who tarry long enough within its gates. In recognition of its cumulative power of attraction, it is said that Pius IX. is wont to shape his words at parting with a foreigner according to his answer to this question: How long have you been at Rome? Should the response be, "A week, Santità," the Pope says, "Adieu"; but should it be "A year," he says, "Au revoir." Certain it is that either because he travelled too rapidly, or for some unknown cause of grievance, not only Rome and Naples and Florence, but Italy generally, found small favor in the author's sight. He finds "its natural beauties and climate overrated by the holiday traveller" (see page 185), although he grudgingly allows that "a few months of a man's life may be passed there with considerable gratification."

Heartily agreeing with him in his protestation against fashion as determining the purchase at high prices of such specimens of pottery and porcelain as are only of value when serving as historical links in large collections, and being entirely of his opinion that fashion is one of the most odious words in the English language, we do not sympathize with our author in his appreciation of majolica, or in his extravagant estimate of Chelsea, Buen Retiro, Capo di Monte, Meissen, and Wedgwood, as the greatest triumphs of ceramic art. All these have their excellences, it is true, but none of them are above criticism. The three qualities which give value to a piece of porcelain are form, design, and color. If these are united in it, it is perfect; if but two, then, though precious, it is imperfect; if it can boast but one, it is still more so; and if none of the three, then it is worthless, save perhaps from a historical point of view. Now, we humbly submit that nothing can be more meretricious than the taste shown in many Dresden groups of the best period; nothing worse in form and color than many pieces of Chelsea, Worcester, and Berlin; and nothing more incorrect in treatment than those Saxon, Prussian, Russian, and Sèvres plates, cups, and dishes which are decorated with landscapes and figures, painted in a naturalistic spirit. Compared with a Greco-Etruscan *tazza*, a tile from Damascus, or any object correctly decorated, their inferiority is apparent.

The book before us does not, for the reasons which we have given, seem to us to come up to the ideal standard of a treatise upon a very rich subject. If that book be ever written, its author will, we fancy, be a man who, besides having the enthusiasm of Major Byng Hall, can write with all the terseness and point of a Martial, or with the picturesque feeling, the power of imagination, and the minuteness of detail of a Balzac. Both the Latin epigrammatist and the French novelist have dealt with bric-à-brac hunting and hunters in a manner which leaves little to be desired.

---

*The Skull and Brain: Their Indications of Character and Anatomical Relations.* By Nicholas Morgan. (London: Longmans, Green & Co.)—This little book is a short defence and exposition of phrenology, with a very fair and exact account of the topography of the brain's surface and its relations to the topography of the skull. Unlike many of his brethren at the present day, Mr. Morgan seems to be an educated man, conscious of the provisional nature of formulas in general and of the formulas of his own art in particular. "Phrenology," he says, "has at the present time no legitimate claim to be a complete system of mental science. . . . Gall and his disciples have possibly fallen into the common error of partisan propagandists, and hoisted their colors too high, and so they may have to lower them a little; but the time for pooh-poohing phrenology is past, and that for investigation is present." Had Gall "only spoken positively of cranial *indications* of special talents, emotions, aptitudes, and tendencies, and omitted for the time being treating of *organ* and *faculty*, a deal of adverse criticism would have been avoided. . . . Even now this course is advisable, for it would appear that we are on the eve of a revolution in cerebral physiology. . . . "

If more phrenologists would talk in this way, fewer "scientific" men would quarrel with them; for we suppose few would feel themselves entitled to deny that the configuration of the skull is symptomatic of the mental character in at least equal measure with the shape of the features, or the hands, or the nature of the "temperament." Viewed in this way, interpretation of the head might lead to a very fairly solid and even useful art, without in the least imitating a science of character. That could only be based on the discovery of the elementary psychic factors of character, on the one hand, and of the elementary organs and processes upon which each of these is conditioned, on the other. Now, from the psychical point of view, the analysis which phrenology makes of the "faculties" is in many points almost grotesque; whilst the ascription of some of them, like concentrativeness, weight, comparison, firmness, energy, according to Mr. Morgan, etc., to localized centres in the brain is wholly so. Mr. Bain's admirable book "on the study of character" has thrown a flood of light over this whole matter, and it is a great pity that the present author evades what, as an apologist, should be his main duty, when he says that the work of Bain is "too exclusively psychological" to come within the province of his present defence. The appreciation of *weight*, for example, is due to the sensitiveness of the muscular innervation, and must be a general property of all the motor centres of the brain, not a small patch above the orbit. "Concentrativeness," or "continuitiveness," as our author calls it, firmness, energy, and so on, are general modes affecting all the tendencies to action of an individual. It is much more plausible to consider them as due to a quality of his cerebral tissue, giving it a peculiar aptitude for a certain *form* of movement, than to imagine them separately located faculties. The only "faculties" it is easy to conceive of as distinctly localized are those of particular sensations and of particular propensities or tendencies to act. These are elements properly so-called. The character of the combinations they incline to enter into in the individual (constituting his comparison, causality, etc.) and the form of his mental movement (his firmness, etc.) would seem due to the *relations* in the brain between the centres for these elements. How to conceive the physical basis of such "sentiments" as "inhabitiveness" or even "self-esteem" is a much harder matter; but most of these sentiments are very complex things. We observe that Mr. Morgan has made a complex thing of alimentiveness by yoking a "bibativeness" (*sic*) to it. This to account for the vice of drunkenness, we suppose, though there never was a clearer case than this of a "faculty" being due not to an organ but to a *condition* of the nervous system. We have heard a phrenologist gravely contend that the relative strength of the gluttonous or the bibulous bump in the opium debauchee will determine whether he eats opium pills or drinks laudanum drops!

"Language" is a complex faculty which the phrenologists have conglomerated. If any one wishes a foretaste of what a really scientific phrenology may some day become—anatomy, pathology, experimental physiology, and psychology, all lending each other a helping hand—let him read a little pamphlet by Dr. Wernicke, of Breslau, called 'Der aphasische Symptomencomplex,' of which a good abstract appeared in the *Boston Medical and Surgical Journal* for May 20, 1875. The difference between a crude empiric art like phrenology as it now is and real scientific method could not be better shown.

*Whip and Spur.* By Geo. E. Waring, jr. (Boston: J. R. Osgood & Co. 1875.)—Colonel Waring has collected into this little volume a series of sketches almost all of which had before appeared in the *Atlantic Monthly*. They have to do mainly with horses and riding, and one or two contain interesting biographies of animals that were particular favorites of the author. He has the art of inspiring in the reader some of his own interest in a horse, and has remarkable facility in describing everything relating to the noble art of horsemanship. During the war he had command of a force of cavalry in the Southwest, and from his account the campaigning must have been very agreeable—at least, at times when it consisted of galloping over a pretty country, mounted on a fine horse, and having an inexhaustible number of opportunities of leaping over every sort of obstacle, surmountable and insurmountable. Unquestionably, the life of a cavalry officer is the poetry of war. Colonel Waring gives also an account of an English fox-hunt, which is more comprehensible than most accounts of the sport, because it does not take for granted that you know all about it beforehand.

*The Law of Literature.* By J. Appleton Morgan. Vol. I. (New York: J. Cockcroft & Co.)—By the "law of literature," any one might suppose that Mr. Morgan meant the law of copyright, but he has made this term very comprehensive, and as used by him it covers not merely that, but the law of libel and slander, the law of contempt of court, and also the law of the restrictions on publication arising out of the regard the courts pay to public morality. Mr. Morgan puts an imaginary production of a literary nature through a sort of judicial examination, the first question propounded being as to the "innocence" of the thing, the second as to its "originality," the third as to whether it is libellous, the fourth whether it is in contempt of court. Now, this is all very well as a series of imaginary tests, but it shows a good deal of confusion in Mr. Morgan's mind to bring together all the cases touching upon these various divisions of the law and call it the law of literature. Merely because it is possible to commit a contempt of court in writing, or by posting up a notice on a wall to the effect that such-and-such a judge is in the habit of taking bribes, we have a whole chapter of cases relating to contempt of court. But the connection between contempts and literature is purely accidental, and it merely obscures the whole matter to treat the two as if they were closely related. So, too, an action for defamation of character has its origin in the damage supposed to be done the character, and is only connected with literature by treating a libel or published slander as necessarily in writing, and therefore literary in character. But a group of statuary might easily be libellous quite as well as a book; yet it would be a curious proceeding on that account to write a book on the "Law of Statuary" or the "Law of Art," and make slander and libels one of its subdivisions. Mr. Morgan has, however, no doubt collected in his volume a large number of important and some quite recent cases, and it will therefore be found of value to practising lawyers.

*Butler's Pictorial History of the United States.* With maps and illustrations. By John A. Stewart, principal of the Reading, Pa., High School. (Philadelphia: J. H. Butler & Co. 12mo, pp. 300.)—It is hard to see why this is called a *pictorial* history, for its illustrations do not differ essentially either in number or character from what we are familiar with in school histories of the United States. They are, to be sure, rather better engraved than is usual, but we do not see that they show any better appreciation of the part that illustrations may properly take in education. Pictures have no business in a school-book unless they either convey knowledge to the pupil's mind or stimulate his imagination. Some of the illustrations in this book are excellent and appropriate; such are "The First Railroad" (p. 202), "Western Emigration" (p. 237), and "Fight of the *Merrimac* and *Monitor*" (p. 261). But the majority are simply agreeable pictures, and some of them not even that. It is an outrage to the child to put such a picture before him as the "Murder of Miss McCrea" (p. 130). The maps are very good, the portraits so-so. We have said so much about illustrations because this is the side by which the book chooses to place itself before us, and because it is a department of the school-book of which our American publishers—of histories, at least—have scarcely shown the glimmering of an idea. In other respects, the book stands fairly enough among its fellows, better than some, not so good as some. The arrangement of the Colonial History—geographical, beginning with the New England colonies—we consider decidedly faulty; and we trust that the practice of marking words for pronunciation has here reached its highest point—Ghil'-bert, Rŏb'-in-son, Charlz'-town, and Yoo'-rōpe.

*Almanach des Spectacles.* (Paris: Librairie des Bibliophiles; New York: F. W. Christern. 1875. Pp. 181.)—This is the first volume of a promised annual issue, in continuation of the series bearing the same name, forty-eight volumes of which were published at yearly intervals, with occasional intermissions, between 1752 and 1815. The five hundred copies to which the edition is limited have been beautifully printed by M. Jouast. A delicate etching of M. Mounet-Sully, by M. Léon Gaucherel, is prefixed. Like its predecessors, this dainty little volume has nothing of the almanac but the name. It is a carefully-compiled theatrical record and dramatic bibliography of the French stage for the year 1874. It contains a complete list of the staff and company of the twenty-seven theatres of Paris, with the pieces played therein; particulars, less full, of the seventeen suburban theatres and of the twenty other places of amusement in Paris; a list of the plays originally produced in the eighteen principal provincial theatres; the roll of the members of the Société des Auteurs et Compositeurs Dramatiques; a list of all the theatrical and musical critics of the Parisian press; a record of official decrees and of competitions and awards; a bibliography and the necrology of the year.

After the Opéra, the place of honor belongs of right to the Comédie-Française, at which there were performed, during 1874, eighty-five plays by forty-nine authors. Seven tragedies were played. Only two pieces were entirely new, one of which was the "Sphinx" of M. Octave Feuillet; two other plays were produced for the first time at this theatre, including the "Demi-Monde" of the younger Dumas. Molière is the author most often represented; fifteen of his plays were performed in all one hundred times. Next came M. Feuillet with five pieces and one hundred and twenty-five performances, and M. Emile Augier with six pieces and eighty-two performances. The statistics of the other theatres are given with less fulness. It is perhaps interesting to note that over one hundred operas, French and Italian, grand, comic, and bouffe, were produced in Paris during 1874, nearly half of them for the first time. This 'Almanach des Spectacles' is a valuable little volume; the editors, MM. P. Milliet and Soubies, have done excellently what was well worth doing.

## The Week.

THE Democrats have done a good piece of work at Syracuse. The platform has again the remarkable merit of being plain, unadorned English. It quotes the Baltimore planks of 1872 calling for the maintenance of the public credit and a speedy return to specie payments, ascribes the existing depression in business to "the reaction from the excessive stimulus of an unhealthy, excessive, depreciated, and irredeemable currency, to enormous ill-adjusted municipal, State, and Federal taxation, and to extravagance, waste, and peculation in the administration of public affairs"; draws a dark, but not over-dark, picture of the evils that would result from further inflation; and then reproduces the terse summary of Democratic doctrine, as understood in New York, contained in the State platform of last year; and after a loud blast of the party horn in honor of Governor Tilden, presents a ticket, all things considered, of unusual excellence. It proposes Mr. John Bigelow for Secretary of State, who is well-known as former editor of the *Evening Post*, more recently Minister to France, and now Chairman of the Commission investigating the State canals; Mr. Lucius Robinson for Comptroller, who won so much honor by his paying the State interest in coin, in the teeth of much obloquy, when Comptroller in 1862. In 1863 he was again elected Comptroller on the Republican ticket, and has since lived in retirement. The candidate for the Attorney-Generalship is a young lawyer who is earning a good deal of credit in the prosecution of the Canal Ring; and the others are, if not equally well-known, thoroughly respectable. Mr. Van Buren, who is proposed for State Engineer, is now a member of the Investigating Commission.

The difficulties of the Republican press in dealing with both the platform and the ticket are very interesting, and are only equalled by its difficulty in dealing with Governor Tilden's pursuit of the Canal Ring. The position it has taken with regard to the latter is that all detection and prosecution of Canal thieves is mere vanity, if not wickedness, unless accompanied by the promulgation of a striking plan for the administration of the canals hereafter, and it deduces the covert immorality in the whole movement *à priori* from the inherent badness of Tilden's nature. Of the platform and ticket it can only say that the very goodness of both is simply a cover for a renewed assault on human rights and the Constitutional Amendments. The unwillingness of the Republicans to have the Democrats get good, in fact, reminds one of the old Connecticut deacon who told the young scamp who wanted to reform and join the church that there "wasn't any vacancy in his church just then, but that when there was he'd let him know."

What makes the position of the Democrats in this State so trying to Republicans is that they are doing what the Republicans have wholly failed to do—viz., producing a candidate for the Presidency whose pretensions are really formidable, and grow more formidable every month. Mr. Tilden had already fixed attention on himself in the fight against the Ring in this city by his wonderful adroitness and energy in accumulating proof of Tweed's guilt; and in his assault on the Canal thieves, he is overthrowing a combination which has really for years governed the State—or, in other words, doing what none of his predecessors ever showed the slightest sign of doing or capacity for doing. In addition to this, or perhaps through this, he has, all accounts agree, obtained almost despotic control of the party, and is using it to purify the nominations. The present ticket is emphatically his, and the appearance of Mr. Bigelow on it, after having decidedly refused a similar offer from the Republicans, is a sign of the times which no good Republican can contemplate without anguish. The explanation of this rise of Tilden is not far to seek. He has few of the external elements of popularity, but he has most of the others. His bodily presence is weak. The female Washington correspondents of the semi-religious press used to speak with great admiration of the effect of Mr. Conkling's "magnificent torso" in the Senate. Mr. Tilden has no "torso" worth mention, but he has a subtle, strong brain and immense capacity for business, and a shrewd, homely eloquence, which does its work without mixed metaphors, and he has prodigious experience as "a manager." In this art he could probably give all the Custom-house men daily lessons without neglecting his own duties. During the anti-slavery struggle or the sentimental period of politics, his incapacity to estimate the force of sentiment—or, in fact, the force of any purely moral ideas—kept him in the background and in pretty constant error and miscalculation. But with the advent of the business period he has rapidly and irresistibly come to the front, for, as a business man, he has probably few equals. In the kind of storms with which we are now threatened he will probably march over the mountain waves, which is rather mortifying for his rival, Mr. Conkling, who finds his "torso" and his rhetoric put away, even by his own party, in the lumber-room.

The call of Mr. Schurz, immediately after his arrival in this country, by the Ohio Republican Committee, to stump the State against Allen, is a curious sign of the times. Three years ago, when he began to draw attention to the abuses and tendencies which were then preparing the ruin of the party, part of the regular morning work of an "organ" was to vilify and deride him, and the Mortons and Logans and Conklings used to wag their heads in a wise, knowing way at the notion that "the great party" could be hurt by such puny assaults, and used to talk as if it was a good thing for men like Schurz to leave it. He had last winter, too, to bear the main brunt of the attacks made on the public credit by Republican senators, whose speeches are now being used as campaign documents by the inflationists in Pennsylvania and Ohio. One cannot help thinking now, however, that the bungling of the Republican chiefs with the currency, and the efforts of some of them to play fast and loose with it, are likely to prove blessings in disguise, by enabling it to get rid of them.

Massachusetts has always had a good, and at times a brilliant, reputation for the ability and statesmanship of the politicians she has produced. It cannot be said, however, that a continuance of this reputation is to be inferred from the list of her eminent men of the last ten years. Governor Andrew was the last public leader of enlightened and comprehensive views she has produced; his successors, though respectable in character, were in no way fitted to make the State take her proper place. The two prominent candidates for Governor, meanwhile, have been General Butler and Dr. George B. Loring; while at Washington the State has been represented most prominently by Messrs. Boutwell and Richardson, who, between them, managed to get the currency into such a condition that Mr. Boutwell is forced into the position of denouncing in the Ohio canvass the very policy which he himself introduced into the Treasury; by Mr. Dawes, the "watch-dog" of Mr. Boutwell's department, who owes his seat in great measure to the favor of General Butler, obtained while the General was fastening his leech, Sanborn, upon the public purse; by Oakes Ames, who employed his talents in bribing Congressmen to help him get money of the Government for the Pacific railroads; and by the Messrs. Hoar, who have defended a policy toward the South which the Administration has been forced by public opinion to abandon. Meanwhile, the men who have really done the State honor, whether in the war or in the public service, have been steadily thrust into the background, and it has been left to the "papers" to recall their forgotten

claims to the people whom they have faithfully and modestly served. Much as has been said, and justly, of the lowness of New York politics, we doubt if any party in this State would dare to put forward as a candidate such a man as Dr. Loring.

Governor Ames, of Mississippi, is experiencing great difficulties, on which we have commented elsewhere, in his efforts to procure "more troops." He first tried to get them under the President's old proclamation of nine months ago, and failing this asked for them because the legislature could not be convened "in time" to meet the emergency. Mr. Pierrepont then asked him by telegraph on the 10th some disagreeable questions about the nature of "the emergency," but could get no satisfactory answer, and finally on the 14th inst. wrote him a letter, which to an old carpet-bagger must have been very distracting. He quotes the President as saying that "the whole public was tired out with these annual autumnal outbreaks at the South, and that the majority was ready to condemn any interference on the part of the Government," and suggesting "that Governor Ames should exhaust his own resources before receiving Government aid." Mr. Pierrepont then calls the Governor's attention to the fact that he (Pierrepont) has no proof, and no allegation even, that the legislature cannot be called together, and that, if called together, it would not support any measures Ames might propose to preserve public order; and he promises him troops when he has complied with the requirements of the Constitution, by either summoning the legislature or doing his best to suppress his "domestic violence" with the State forces. Ames, however, begs for the troops, and declares his willingness to have "the odium in all its magnitude descend on him," which must be satisfactory to the Administration.

The friends of Mr. Henry Ward Beecher in Brooklyn had determined, with that extraordinary fatuity which has all along marked their treatment of the Scandal, to hire the Academy of Music and give him a big reception when he came home from the Mountains, as an expression of "their just pride in the reputation he had deservedly won in his own and foreign lands, as far as Christian civilization extends." He has, however, very judiciously declined the proffered honor, for reasons which are none the less sensible or forcible for being enveloped in the peculiar rhetoric which the late trial has made famous. He thinks it would "tend to keep alive feelings that ought to subside, to renew discussions of painful public transactions which should never have had an existence, and which it were well, both for public and for private good, to have removed, if not to forgetfulness, at least to obscurity." We must say we think this argument tells with equal force against Mr. Beecher's mode of passing his summer. The notion that anything worthy of the name of religion could be spread abroad under the conditions attendant on the exercises at the Twin Mountain House is simply another result of the moral and mental miasma which produced the Scandal itself. The first sign of sanitary improvement in and about Plymouth Church will be the retirement of pastor and congregation as far as may be from the public gaze, and the general subsidence of vindicatory zeal and activity.

The trial of Harrington for the Safe robbery disclosed a very corrupt state of things in the District of Columbia, but the retirement of District-Attorney Fisher, which has just taken effect, shows how much more the District resembled this city under the Ring than any one imagined. Fisher's son and late assistant has been arrested on the charge of abstracting from the office important papers, including warrants, informations, and appeal-bonds, mostly in prosecutions for selling liquor without license and other finable offences, but also in some criminal cases. Apparently, his object was to extort money. It is also alleged that in the case of a burglar he first released him by getting up a counterfeit responsible bail and then divided his plunder with him. There seems to be no doubt about his guilt. He made little concealment of his operations, and many of the missing papers have been traced to him and recovered.

The gold market continues to command unusual attention, not simply from Wall Street but from the mercantile community. Early in the year intelligent observers expressed the opinion that there might be serious trouble before the year was out on account of a reduction in the supply of gold in the market and in the Treasury. The reasons which supported this opinion were: (1) that the specie shipments to settle trade-indebtedness would be unusually large unless Europe took an extraordinary amount of our securities during the summer; (2) that if the Secretary held to the opinion that the 5-20 bonds bought in excess of sinking-fund requirements from the time Mr. Boutwell was secretary until now could not be entered to the account of the Sinking Fund, and that accordingly $30,000,000 additional bonds must be redeemed each year, the calling and redemption of these bonds would compel us to send to Europe, where a good part of the called bonds were held, a still further large amount of specie; and (3) that if Mr. Bristow attempted to carry out that section of the Sherman bill which authorized him to part with gold to secure silver to be coined and substituted for fractional currency, it would inevitably follow that in the specie shipments gold would take the place of silver to the amount which represented the silver held by the Government for coinage purposes. Unfortunately, Europe during the past six months has not taken from us as many of our securities as have been returned to us from there by reason of the Treasury redemptions of 5-20 bonds; and we have been compelled to ship as large an amount of specie as it was feared we might be. The Treasury, too, has bought $15,000,000 of silver, which might have been exported without any more inconvenience to the country than the export of the same amount of merchandise, and the gold sent in its place saved. The result has been that the stock of gold in the Treasury has been brought down, while that in the market is probably now not over $7,000,000.

The smallness of the stock of gold in the market furnishes abundant explanation of the high premium on gold, and of what is of still greater importance to mercantile interests—the distressing rates which obtain for its use; and these rates explain the unsettled condition of the foreign-exchange market, which has already become sufficiently bad to block practically the export trade. Looking about for relief, it is seen that none can be obtained from the Treasury, even if were desirable that it should come from that source, and that gold must be imported in order to furnish a sufficient supply of the money of the world to facilitate transactions in foreign exchange—that is, to permit of the sale of bills against shipments, which cannot otherwise be made, of grain, cotton, etc., which Europe is ready to buy, and wants. Accordingly, the rates of exchange have fallen during the week to the point which permits gold imports. Bankers estimate the amount of gold thus far sent from London at about $1,500,000, but more is expected—in fact, more is necessary to enable us to move such staple crops as cotton. With these commercial reasons for the price of gold, it will be seen that political considerations have not had much chance to make themselves felt. At the Stock Exchange speculation has been restricted. The tendency was to lower prices until the latter part of the week, when it was reversed. The money market is becoming firmer, and with the steady reduction in the bank reserve now going on, a 6 to 7 per cent. market is expected in a few weeks. The only thing that can prevent it will be stagnation in trade, and from present appearances trade will be good unless upset by the disturbances growing out of the gold market.

The Guibord case in Canada still excites discussion, and the more it is discussed, the worse figure the Church cuts in it. It appears that a literary society—the Institut Canadien—got into a quarrel with the Bishop over their library, which he said contained infidel or immoral books, one of them thus objected to being something of Horace Greeley's on religious liberty. They appealed to Rome against him; but the Papal Court took no notice of the matter until the Bishop went over himself, and he was then allowed to

send home a decision in favor of himself and against the Institut in a pastoral letter; and he ordered his priests to refuse the members the sacraments, even in the article of death, for having such a library, and for publishing or reading an 'Annuaire' of 1863. The Society, therefore, gave up the 'Annuaire,' and declared by resolution that "they were a purely literary and scientific body and taught no doctrine of any kind, and carefully excluded all teaching of pernicious doctrine." This, instead of pacifying the Bishop, enraged him; for this resolution, he declared, "established the principle of religious toleration, which had been the principal ground of the condemnation of the Institut." Guibord died in 1869 without the sacraments; his wife sought to have him buried in the cemetery, which was not then consecrated, but was refused, and after much vexation she became insane, and died also; but the Institut carried the case up to the Privy Council, which decided that under the old French ecclesiastical law, to which the Bishop had appealed, and which had been reserved by the Treaty of Cession to Great Britain, Guibord, if not excommunicated, was entitled to burial in the Catholic burying-ground; and they decided that under the canon law he had not been excommunicated, as in order to deprive a person of his ecclesiastical rights excommunication must be formal and personal, and cannot reach a man as a member of a category. While the case was before the Privy Council the church consecrated the cemetery, hoping thus to make its case stronger, and since the decision the Bishop has tried to escape its effects by declaring his intention to curse that portion of the cemetery in which Guibord may be interred. In the meantime, it has been discovered that only twenty-three men of the Montreal police can be relied on to put down a religious riot. It is worthy of note that the Bishop assumes in this controversy that a Catholic has no right to belong to a club whose library may contain books of which he (the Bishop) pleases to disapprove, even though he does not read them, or to a society which agrees to exclude the teaching or recognition of religious doctrine.

---

The Papal Nuncio at Madrid, who is, strictly speaking, the ambassador of a foreign prince, has just addressed a circular to the bishops within the kingdom which furnishes an excellent illustration of the way in which the Church adapts its pretensions to its surroundings. We have as yet, it is true, only a telegraphic summary of it, but there can hardly be room for much error in stating its leading points. It claims the fulfilment of the concordat with the Spanish Government which forbids the worship of any non-Catholic denomination, and demands the transfer of the superintendence of popular education to the clergy, and the aid of the secular power in suppressing heretical teaching and literature, and declares that one of the causes of the civil war is the way in which religious unity has been misunderstood by previous governments. The address of the Nuncio directly to the Bishops, without the intervention of the Government to which he is accredited, is perhaps as daring an assertion of the Pope's claim to *imperium in imperio* as has been witnessed for a long while. Consequently, the only way to stop such things, and to bring the clergy in countries like Spain, where they have long enjoyed a sort of superiority to the law, to a realizing sense of their subjection to it, and to prevent their attempting to exercise an influence on politics hostile to the law, is the Bismarckian way. It undoubtedly seems hard to put bishops in jail, or expel them from the country for issuing circulars; but then it is not necessary to do it often. A few cases are all that is needed. As soon as it is found that the Government and the police are not frightened by cursing, the representative of God on earth dwindles into a plain citizen, who goes about his business like other people—silently, moderately, and with proper respect for the secular rights of his fellows, and keeps to himself whatever claims he may have to the government of the world.

---

When the late M. Coquerel passed away, he left his co-religionaries, the Liberal French Protestants, in great distress of mind. Our readers may remember that the last French Ministry but one chose to insist upon the powers of the orthodox Synod over the whole French Protestant body. As a consequence, it refused to confirm the election of Liberal pastors when conducted in disregard of an oath or shibboleth which the Synod sought to impose. New elections had been ordered when the Ministry went out of office, but M. Wallon, the new Minister of Public Worship, suspended them, and submitted the question of the legality of the elections to the Council of State. The Council has been very tardy in acting on it (it has had since March last to reach it or to make up its mind), and, meantime, in the Liberal parishes services have been suspended, and the complete uncertainty as to their future has caused the greatest anxiety. This has now been relieved for the present by M. Wallon, who consents to cut the knot by a provisional confirmation of the pastors whose election is contested, provided that the consistories explicitly ask for it, and in each case acknowledge the arrangement to be purely temporary and in no way hampering the final decision of the Government. The compromise has been very gratefully accepted by the Liberals. Whether there is to be one or two Reformed Churches now depends on the Council and perhaps on M. Guillaume Guizot.

---

Marshal MacMahon has done a good thing, and one which seems likely to have an excellent political effect, in dealing promptly with a very gross case of insubordination in the navy. Admiral de la Roncière-le-Noury, in command of the squadron in the Mediterranean, wrote a letter in reply to an invitation to a Bonapartist reunion, in which he declared in substance that his adhesion to the existing régime was only temporary; and, in substance, that he would support Marshal MacMahon as long as his administration gave him (the Admiral) satisfaction. Whereupon he was promptly ordered to strike his flag, and placed on the retired list. There could be nothing more dangerous in a country situated as France is than a disposition on the part of the army and navy to mix themselves up in politics and form preferences between governments. If this were once allowed to grow up, the reduction of the country to the condition of Spain would be only a question of time. Besides giving a most important lesson in discipline, the Marshal has of course by this act greatly conciliated the Republicans, and it will go far to convince men of all parties that they have at last got an honest man at the head of the administration.

---

The news from Herzegovina is again conflicting, and is likely to be so for some time. There is evidently no considerable or organized body of insurgents in the field. The Turkish troops probably have things their own way wherever they move, but small guerilla parties have occasional successes, probably often against civilian Turks and Turkish villages, which keep hope and excitement alive. The foreign consuls are said to be making strong efforts at mediation, but are unsuccessful, owing to the simple fact that the insurgents have no responsible head whose authority is acknowledged or can make itself felt by the various bands. The news of late, it will be observed, comes now mainly from Servia, where there is a strong party intent on driving the Principality into hostilities with Turkey, but it has thus far only succeeded in carrying a non-committal address to the Prince in the legislature. If it be true, as is likely, that the Turks have now 50,000 men in Bosnia, the cause of the insurrection, in default of outside interference, is hopeless. Its only chance of success lay in bringing about a serious rising, and committing Servia and Montenegro before Turkey could reach the ground with reinforcements or Austria could interfere. The English and Continental press still discuss the affair with great animation, all being agreed that something must shortly be done about Turkey; but the only proposal that thus far has met with much favor is that Bosnia and Herzegovina should have a semi-independent administration, which would, of course, as in the case of Servia and Roumania, be simply a preliminary to total separation—a fact which the Ottoman Government perceives clearly.

## THE POLITICAL SITUATION.

IT is becoming every day clearer that the two great political parties are likely to go to pieces on the financial question, in spite of the efforts of both to prevent it, and that next year, whatever may be the result of the pending elections, there will be substantially two new parties—one for inflation and one for resumption. What they will be called, or, if still called Republican and Democratic, as we presume they will be, which will be which, it would be difficult to say with confidence, but the chances are that the resumptionists will be Republicans and the inflationists Democrats, if those names are preserved. But then neither party will be what it is now. The present Republican leaders, for instance, must necessarily "take back seats," and there will be a large accession to its ranks of persons who, while opposed to its policy in times past on Southern questions, are frightened by the vagaries of the "soft-money men" and their influence in the Democratic party. In fact, the process of "taking back seats" may be said to have been begun the other day at Saratoga, and one of its first victims was, as might have been expected, Mr. Conkling. In 1872, this gentleman was the acknowledged manager of the Republican party in this State, and its greatest man. He stumped it so successfully that year against poor Greeley that he was said by the party organs to "have left a line of light" behind him wherever he went, and he was sent back to the Senate as a matter of course, and became a great power at the White House. Two years later, the State went the other way by 50,000 majority; and this year he had actually to be kept out of sight at the State Convention, in order to enable the party to make a decent appearance before the public. Hope of victory there was and is none; and yet Mr. Conkling is neither worse nor better, wiser nor more foolish, in 1875 than he was in 1872. His career is an excellent illustration of the way in which the party has reached its present plight.

The men who took charge of it at the close of the war as the old chiefs who conducted the war died, or were deposed or grew old, were generally second-rate men, who rose to the surface by dexterity simply in the period of "management" which, in party history, follows the period of enthusiasm. They had not and did not need to have any marked qualities beyond skill at conventions and glibness in the use of Republican phraseology about "human rights" and "national integrity." Many were converted Democrats, like Butler and Boutwell; others were adventurers flushed with the fame of country court-rooms; but none of them needed to pass through any rude or searching ordeal either as to feeling or opinion or character in order to get into the highest places. Mr. Conkling was one of this latter class, and he re-entered the Senate with the air and power of a Webster or a Calhoun, without ever having uttered a word on any subject which a single human being would have cared to weigh or remember. Now, to these men it was a matter of life and death to keep the party occupied with and concerned about the pacification of the South, to represent the pacification of the South as a gigantic job, which this generation would hardly see accomplished, and a job which would have to be done by Congressional legislation. This was the subject with which they were most familiar, and on which they had won their little oratorical triumphs and had climbed into office, and about which they thought the popular excitement was greatest and likely to last longest. When the Ku-klux operations began, it seemed as if the madness of the South would make their fortunes secure, and indefinitely prolong their hold on the Government.

The consequence of this was that the party, as a party, took no hold whatever of the national problems which the war had left for solution. Its attention was deliberately turned away from the abuses of taxation and administration and currency which the war had created, and which needed to be promptly dealt with after the war was over, in order not to become chronic maladies. The newer men who sought to occupy themselves with them were sneered at or discouraged or treated with suspicion. Mr. David A. Wells, whose reports, whatever their faults, had the inestimable merit of attracting attention to the questions of national currency and taxation which lie at the basis of all healthy politics, was summarily kicked out of the Treasury as soon as he began to be much talked about, and the Treasury itself was put into the hands of a man without financial knowledge or experience, or general ideas, or capacity for reasoning, and thoroughly hardened in the tricks of political chicane. Civil-service reform, owing to the exertions of a few enthusiasts, was pushed so hard that it obtained slight but derisive recognition by a bill, meant to be a sham, authorizing the President to appoint a commission, and by a plank in a Presidential platform; but every attempt to treat it seriously was summarily suppressed and ridiculed. In the meantime, everything that could be done was done to magnify the insecurity of life and property at the South, and the malignity of Southern discontent. The plan of making Southern discontent appear perennial and dangerous in the eyes of the North was, however, frustrated by two things—one, the operations of the carpet-baggers, and the other the return to the Southern whites of that political wisdom which, in spite of the great slavery hallucination, has never wholly deserted them, and has, we believe, now been the means of preventing the gradual conversion of the Federal Administration into a huge machine for the government of conquered provinces.

In the meantime, however, there was one question behind the party which could not be ignored or put out of sight, and which, as all history has shown, was the most explosive question with which a politician can be called on to deal—we mean the condition of the currency. This is the one political question which touches every heart and every interest, about which passions are fiercest and prejudices blindest, and on which knaves and demagogues fasten most eagerly. The only safety lay, after the war, in taking it up fearlessly before the knaves and demagogues found out the mine there was in it, treating the greenbacks as a pressing debt, and calling on the still fervid patriotism of the North to make one more sacrifice to the country by paying it off. A man who took this sane and healthy view of the matter, Mr. McCulloch, got into the Treasury during Andrew Johnson's administration, and in a moment of inadvertence the party chiefs allowed him to have his own way; but as soon as it was found that he was pushing the currency question to the front and making it a "burning question," he was summarily shorn of his power. His successor, Mr. Boutwell, was actually allowed to inflate the currency in his own discretion, and was allowed, without rebuke, to claim the right of inflating it as a useful appurtenance of the office of Secretary of the Treasury. In this way we drifted into the panic of 1873, and then the crash came. At the first touch of financial distress, the mad fever of inflation burst out, and the Republican party then found that the most important question of this century, after slavery, had passed out of its hands, and had become an open question, and was likely to prove its ruin. After a few frantic but vain turns of the Southern "outrage" crank, it has tried to face the difficulty, but it is evidently too late. The party is divided on it; among the chiefs there is not a single man who is an authority on it, or has studied it, or can speak about it with great weight, or has made any particular mark about it, while there are but few who have not dilly-dallied over it and been double-faced about it. The question, in fact, is not a Republican question; the Democrats have just as much claim to it; and the result is chaos. There is something, indeed, ludicrously odd in some of the scenes in the crisis. With the national credit and the business of the country in peril or suspense, awaiting the result of the elections, Conkling has to be hidden in a garret, and Boutwell, the great author of "the reserve" and the very father of inflation, is sent out to stump Ohio on behalf of hard money.

The duty of the independent voter under these circumstances is of course somewhat difficult to determine. No general rule can be laid down about it. Neither party is sound on the currency question. Among the chiefs on both sides, there has been shameful evasiveness and double-dealing about it. The Republican party is fairly and directly responsible for the present state of things, and the Democrats would be entitled to its place if they were not,

on their side, abandoning the position they held at the beginning of the war, and making a wonderful display not simply of incompetency on this delicate subject, but of general recklessness and dishonesty. The safest course, therefore, for a man sincerely desirous of saving the national credit, and warding off frightful commercial disorder, would seem to be to vote in his own State for whichever party is soundest and most straightforward with regard to the duty and expediency of resumption. In any particular State, the important thing is not that the Republican or the Democratic ticket should be elected, but that that ticket should be elected the triumph of which will give most confidence and encouragement to the party of hard money all over the Union. In this State, most assuredly, Mr. Tilden and his friends have claims on public confidence just now which it would be impossible to concede to Conkling, Murphy, Bliss, Gardner, and the other Custom-house publicists whose career is now drawing to a close; but then it must also be said that any one who distrusts Tilden and his friends on the ground of their antecedents cannot go wrong in voting for the Republican candidates. In either case, his vote will tell in favor of the return to honest finance at an early date.

## THE NEW VIEW OF "DOMESTIC VIOLENCE."

THE correspondence between Attorney-General Pierrepont and Governor Ames of Mississippi is both entertaining and instructive. It is one of those incidents in politics which shed light in every direction, on the past as well as on the present and future, especially when taken in connection with the resolution of the recent Republican Convention in this State condemning military interference in the Southern States, except in cases clearly provided for by the Constitution. When the carpet-bag governors, aided by the United States Marshal, began a year ago to get up "outrages" and call for Federal aid, all attempts to get the Government at Washington to bear in mind the constitutional restrictions on Federal interference in State affairs were idle. Troops were despatched in all directions, without preliminary enquiry, on the click of the telegraph. They were used in Louisiana to organize the State Legislature and to discharge ordinary police duties in the interior, and at last matters reached such a pass that a military officer of high rank, who had been sent down to examine the situation, recommended the general outlawry and delivery to military execution, by Presidential proclamation, of whole classes of American citizens, and this was subsequently justified by a Republican speaker of high standing—an ex-Cabinet officer—in the Connecticut canvass, as a legitimate expression of official indignation. Finally, the troops were sent up to Vicksburg to settle, and they did settle, by force of arms, a dispute between two candidates for the office of sheriff such as comes before the courts on a *quo warranto*. Behind these more open and flagrant violations of law, there was going on, preparatory to the election, a system of wholesale arrests of white citizens by parties of cavalry on the charges of "intimidating" negroes, which from their very nature were incapable of disproof. There can be no more vague term than "intimidation."

There was no doubt at the time in our minds that all this was part of an electioneering scheme on a great scale, for which the Force Acts and the Attorney-General's office were to supply, and did supply, the machinery. A number of Republican politicians in Washington had got it into their heads that the safety of the country required that the Southern States should be held by the Republican party, and that the way to secure this was to keep up a semi-military rule under civil forms in the States lately in rebellion. To make the plan the more complete and safe, it was backed up by the theory, which was studiously preached, that the President was a simple-minded soldier, who sat quietly at the White House executing such laws as Congress supplied him with, under the advice of the legal sage in charge of the Department of Justice, but who had no feeling or opinion of his own about the matter one way or the other. It so happened, however, that the legal sage was chosen by General Grant himself, and kept in office with something that looked very like keen appreciation of his peculiar abilities. The Attorney-General's opinions ran, in fact, all the one way. The freedom of his "legal mind" from doubts was one of the most remarkable incidents of the crisis. Somehow, it seemed to him that all *states* of facts and *all* emergencies called for the despatch of troops. More remarkable still, as soon as the opinion of the country, as expressed through the press and the fall elections, emphatically condemned the semi-military régime, Mr. Williams was allowed to resign, and "the outrages" ceased. The negroes were no longer murdered or intimidated; quiet began to prevail all over the South; and this spring the murderers and their victims—the banditti who passed their days "intimidating" and the negroes who, according to Mr. Dawes, never went to bed without expecting to find their throats cut in the morning, and therefore, presumably, lay awake all night—managed between them to plant a crop of cotton, to say nothing of corn, which is now estimated at 3,833,000 bales. A more remarkable performance is, under all the circumstances, not to be found in the annals of industry.

Under the new Attorney-General there has been no revival of outrages; but his manner of dealing with the late disturbances in Mississippi brings out in sharp relief the peculiar characteristics of the system in use in Mr. Williams's day. There is a riot at a public meeting of the usual Southern type, beginning in a quarrel between two men, and ending in the killing of several and the "intimidation" of a good many more. Such incidents have been common at the South ever since the settlement of the country. What people used to say about them was that they were the product of a low state of civilization, to be cured by time, religion, and education; but the Republican theory of them in the Williams period was that they were the beginning of a general insurrection against both the State and Federal Governments, and therefore called for a prompt application of martial law. In that period, too, it was always held that it was the governor, and not the legislature (or not the governor *and* the legislature), who constituted the government of the State, and his applications, therefore, always received prompt attention. He was not questioned as to the nature of the crisis or as to his ability to convene the legislature. Accordingly, Governor Ames first asked whether the State was not *de jure* in a condition of insurrection or domestic violence, under a proclamation issued nine months ago—one of the theories of the Williams period, propounded during the troubles at New Orleans, being that when the President had proclaimed a State as assailed by domestic violence, the effect of the proclamation would be indefinitely extended, so as to cover all fresh disturbances. He learned from Washington that this novel but convenient view had been abandoned. He then, but not until then, apparently looked into the Constitution, and reported that domestic violence was raging around him, but that the legislature could not be convened "in time" to judge whether Federal help was needed, and therefore he demanded it himself, and immediately. It will be observed that the cunning rogue put in the phrase "in time" himself. The Constitution does not contain it. The theory of its framers clearly was that the domestic violence which the United States was to help to put down was to be violence so great that the State forces, after a fair effort, could not suppress it, and therefore likely to be so protracted that the State legislature would have ample time to meet and consider what had best be done, and that the governor was only to act alone when the violence was so widespread and serious that the members of the legislature could not reach a common place of meeting. But the carpet-bag governors have held that they might have the Federal aid whenever, in their opinion, the disturbance would be over before the legislature could assemble, and on this view Mr. Williams always acted. Mr. Pierrepont, however, approached the matter in a different way. He got the troops ready, but then put to Governor Ames a question before which the whole carpet-bag theory of Federal duties dissolved at once. He asked him: "Is there such an insurrection against the State government as cannot be put down by the State military

forces, aided by all the other powers of the State government and the aid of true citizens?" To this enquiry, sent on the morning of the 10th inst., the Governor, although the emergency was so pressing that the State legislature could not be convened "in time," returned no answer until late on the night of the 11th, and then it came in the shape of a rambling, evasive despatch, putting the trouble on the peculiar relations of the two races, but not furnishing the required facts. The troops have accordingly not been sent, and the domestic violence is fading away.

It is hardly necessary to point out the bearing this has on the occurrences of last year. It shows clearly that the President and his advisers, and his stump-orators, and his military commissioners were wrong at that period, both as regards their own duty and the rights of Southern citizens, and it shows that those who then, at the cost of much obloquy, criticised them so severely, were doing exactly what the occasion called for, and that what they did has borne fruit.

## CHAUNCEY WRIGHT.

THE death which we briefly noticed last week reminds us most sadly of the law, that to be an effective great man one needs to have *many* qualities great. If power of analytic intellect pure and simple could suffice, the name of Chauncey Wright would assuredly be as famous as it is now obscure, for he was not merely the great mind of a village—if Cambridge will pardon the expression—but either in London or Berlin he would, with equal ease, have taken the place of master which he held with us. The reason why he is now gone without leaving any work which his friends can consider as a fair expression of his genius, is that his shyness, his want of ambition, and to a certain degree his indolence, were almost as exceptional as his power of thought. Had he, in early life, resolved to concentrate these and make himself a physicist, for example, there is no question but that his would have ranked to-day among the few first living names. As it was, he preferred general criticism and contemplation, and became something resembling more a philosopher of the antique or Socratic type than a modern *Gelehrter*. His best work has been done in conversation; and in the acts and writings of the many friends he influenced his spirit will, in one way or another, as the years roll on, be more operative than it ever was in direct production. Born at Northampton in 1830, graduating at Harvard in 1852, he left us in the plenitude of his powers. His outward work is limited to various articles in the *North American Review* (one of which Mr. Darwin thought important enough to reprint as a pamphlet in England), a paper or two in the Transactions of the Academy of Arts and Sciences, and a number of critical notices in our own pages—the latest of these being the article entitled "German Darwinism," which we published only two weeks ago. As a writer, he was defective in the shaping faculty—he failed to emphasize the articulations of his argument, to throw a high light, so to speak, on the important points; so that many a casual peruser has probably read on and never noticed the world of searching consequences which lurked involved in some inconspicuously placed word. He spent many years in computing for the *Nautical Almanac* and from time to time accepted some pedagogic work. He gave a course of University lectures on psychology in Harvard College in 1871, and last year he conducted there a course in mathematical physics. As little of a reader as an educated man well can be, he yet astonished every one by his omniscience, for no specialist could talk with Chauncey Wright without receiving some sort of instruction in his specialty. This was due to his irrepressible spontaneous habit of subtle thinking. Every new fact he learned set his whole mental organism in motion, and reflection did not cease till the novel thought was firmly woven with the entire system of his knowledge. Of course in this process new conclusions were constantly evolved, and many a man of science who hoped to surprise him with news of a discovery has been himself surprised by finding it already *constructed* by Wright from data separately acquired in this or that conversation with one or other of the many scholars of Cambridge or Boston, most of whom he personally knew so well.

In philosophy, he was a worker on the path opened by Hume, and a treatise on psychology written by him (could he have been spared and induced to undertake the drudgery) would probably have been the last and most accomplished utterance of what he liked to call the British school. He would have brought the work of Mill and Bain for the present to a conclusion. Of the two motives to which philosophic systems owe their being, the craving for consistency or unity in thought, and the desire for a solid outward warrant for our emotional ends, his mind was dominated only by the former. Never in a human head was contemplation more separated from desire. Schopenhauer, who defined genius as a cognitive faculty manumitted from the service of the will, would have found in him an even stronger example of his definition than he cared to meet. For to Wright's mode of looking at the universe such ideas as pessimism or optimism were alike simply irrelevant. Whereas most men's interest in a thought is proportioned to its possible relation to human destiny, with him it was almost the reverse. When the mere actuality of phenomena will suffice to describe them, he held it pure excess and superstition to speak of a metaphysical whence or whither, of a substance, a meaning, or an end. Just as in cosmogony he preferred Mayer's theory to the nebular hypothesis, and in one of his earliest *North American Review* articles used the happy phrase, "cosmical weather," to describe the irregular dissipation and aggregation of worlds; so, in contemplating the totality of being, he preferred to think of phenomena as the result of a sort of ontologic weather, without inward rationality, an aimless drifting to and fro, from the midst of which relatively stable and so (for us) rational combinations may emerge. The order we observe in things needs *explanation* only on the supposition of a preliminary or potential disorder; and this he pointed out is, as things actually *are* orderly, a gratuitous notion. Anaxagoras, who introduced into philosophy the notion of the νους, also introduced with it that of an antecedent chaos. But if there be no essential chaos, Mr. Wright used to say, an anti-chaotic νους is superfluous. He particularly condemned the idea of substance as a metaphysical idol When it was objected to him that there must be some principle of oneness in the diversity of phenomena—some *glue* to hold them together and make a universe out of their mutual independence, he would reply that there is no need of a glue to join things unless we apprehend some reason why they should fall asunder. Phenomena *are* grouped—more we cannot say of them. This notion that the actuality of a thing is the absolute totality of its being was perhaps never grasped by any one with such thoroughness as by him.

However different a philosophy one may hold from his, however one may deem that the lack of emotional bias which left him contented with the mere principle of parsimony as a criterion of universal truth was really due to a defect in the active or impulsive part of his mental nature, one must value none the less his formulæ. For as yet philosophy has celebrated hardly any stable achievements. The labors of philosophers have, however, been confined to deepening enormously the philosophic *consciousness*, and revealing more and more minutely and fully the import of metaphysical problems. In this preliminary task ontologists and phenomenalists, mechanists and teleologists, must join friendly hands, for each has been indispensable to the work of the other, and the only foe of either is the common foe of both—namely, the practical, conventionally thinking man, to whom, as has been said, nothing has true seriousness but personal interests, and whose dry earnestness in those is only excelled by that of the brute, which takes everything for granted and never laughs.

Mr. Wright belonged to the precious band of genuine philosophers, and among them few can have been as completely disinterested as he. Add to this eminence his tireless amiability, his beautiful modesty, his affectionate nature and freedom from egotism, his childlike simplicity in worldly affairs, and we have the picture of a character of which his friends feel more than ever now the elevation and the rarity.

## AN ALSATIAN SAINT.

STRASBOURG, August 24, 1875.

I WOULD recommend all those who stop for a few days at Strasbourg to take the railway as far as Obernai, and from there to ascend the woody slopes of the Vosges to the top of the famous Hohenburg. The precipitous rocks of red sandstone which form the crest of the Vosges are covered with the buildings of the old convent of Saint Odile. From the terraces of the convent the view extends over the plain of Alsace; the spire of the Strasbourg Cathedral rises on the horizon, and behind the line of the Rhine you see the parallel chain of the Black Forest. There are few finer views; you understand, as you see the rich vineyards, the hop and tobacco fields, the yellow corn-fields, that these magnificent plains, covered with as fertile a loam as that of Egypt, has been often and will still be fought for; Alsace is, like Lombardy and Flanders, one of the great prizes of the struggle for life of nations.

I remember the Hohenburg when it was quite abandoned. It had become the property of a friend of mine, and as we once spent a night in the deserted cells of the convent we could hear the mice running quietly all night long. My friend sold the Hohenburg to the Bishop of Strasbourg,

the chapel was repaired, and there exists now a small congregation which lives altogether in the old establishment of Saint Odile. The monks work in the fields, in the forest, in the gardens; the sisters are chiefly devoted to the numerous pilgrims and to the travellers who come to enjoy, sometimes for a week or two, the pure air of the mountain. It can hardly be denied that the establishment, on the whole, savors more of the inn than of the convent. You are helped during the meals by sisters in their black gowns and white caps, in long, whitewashed refectories. There is a certain solemnity about the place, but the tourist element has become the most important: beer, cigars, Kirschwasser, are the order of the day, and the Alsatian nuns are reduced almost entirely to the rôle of inn-servants. The change has become even more striking since the conquest of Alsace, as the Hohenburg is one of the favorite promenades of the conquerors. Every day at twelve, which is here the dinner-hour, two tables are served in separate rooms, one for the French-speaking tourists and one for the *Prussians*, for all Germans still go under this formidable name. I asked the Lady Superior if the Hohenburg congregation had thus far not been disturbed by the Falk laws; she told me, with a smile, that they had been forgotten on their mountain, that thus far they had had no persecution to suffer. Everything goes on as in old times. There are days in the year when hundreds of peasants, with their wives and children, ascend the mountain, go to the miraculous well where Odile was refreshed by water pouring from the rock at the place where she put her hand; they contemplate the place where her knees made a hole in the sandstone, so often did she pray for the wicked lords of her family. Her bones are no longer shown to the pilgrims, as they obviously could not have belonged to a woman.

The legend of Saint Odile still exists, but it has been, so to speak, purified and improved. As Odile is the patroness of Alsace, you will understand at once its importance. Some Germans, or Germanizing writers, have tried to deny her existence. The death of Odile is commonly placed in the year 750; there are no authentic documents mentioning her in the eighth or ninth century. Hohenburg is mentioned for the first time in 837 in a *charta* of Louis le Débonnaire; this *charta* exists in the archives of Strasbourg, but the name of the first abbess is not mentioned in it. The son of Charlemagne merely confirms the privileges of the Hohenburg convent. Odile was not canonized at the time, and he does not mention her name. The legend of the saint did not crystallize until the twelfth century; it cannot be denied, however, that the pope (Leo IX.) came to Alsace in the year 1049, that the Hohenburg convent was aggrandized under the patronage of this Alsatian pope, and that on this occasion an authentic bull of 1050 mentions the canonization of Odile. Some German professors have pretended that the Alsatian pope was moved by family interests, and that the name of the Alsatian abbess was a convenience for him. This would prove, at any rate, that this name had a great prestige in the eyes of the population. It had become a synonym of purity, chastity, and sanctity in the most troublous times of the Middle Ages. The Alsatian pope was not an imbecile; he was a scholar well versed in ecclesiastical history. He was born in 1002, about 250 years after the supposed death of Odile; she belonged to his family, and her virtues had probably become a *titre de noblesse* for the house of Eguisheim-Dagsburg. Everybody believed at the time of his journey that Odile was buried on the Hohenburg, and her tomb was supposed to have a miraculous virtue. No opposition was made in the Catholic world when she was canonized, though the Franconian family, which then held the imperial throne, was not always friendly to the papacy. Historical science sometimes defeats its own object; the German school of critics has often proved that things never existed which afterwards were proved to have existed after all. A fact is a hard thing to suppress; to me it appears evident that Odile was a fact, that she did exist. This once admitted, the details of her legend are, in an historical sense, almost indifferent: her legend is not so, as the legend evidently embodies the best aspirations, the instincts and ideas of the age in which she lived, and which she impressed by the originality of her life. The tomb of Odile can no longer be seen, as it once could; and it may even be that nothing of her remains on the mountain. The Magyars plundered Hohenburg; the houses and chapels built under the last Merovingians and the first Carlovingians have been replaced at later periods. One thing could not be touched by the Magyars, nor destroyed by the rains and winds: it was the memory of a daughter of a great Alsatian duke who, towards the end of the Merovingian period, left the castle of her father, the noise and revelry of the Alsatian nobles, and chose to live on the Hohenburg, which must have been then almost inaccessible. The road which now conducts to the summit of the mountain was only built a few years ago, and I have never made the ascension except by foot-paths among the old fir-trees.

The contrast between the passions of men and the serenity of nature is an eternal theme for poetry. I spent many hours yesterday on the great terrace of the Saint Odile Convent; I heard near me the playful voices of French children. Were they Alsatian or French? What will be their fate? Will they fight some day under the tricolor flag, or under the Prussian eagle? A German officer had opened a staff map, and he was studying the position of the villages, the direction of the roads, as carefully as if he had to give to-morrow the order of march for a battle. Two young French seminarists had come from Nancy to visit the miraculous well of Odile. Did they believe in it? did the spring of unbounded faith flow in their hearts? They seemed so happy; they asked many questions of me, and I could not help remembering the magnificent verses of Musset:

> "O Christ, je ne suis pas de ceux que la prière
> Amène à pas tremblants sous tes arceaux muets."

Who is right, and who is wrong? Is human life an empty show, like those clouds which were rolling over the distant mountain, and which vanished in the heat of the plain? Ivan Turgenef represents one of his heroes leaving heart-broken the town where he has lost everything, and murmuring in his railway car, "Smoke, smoke!" as he sees the swift and evanescent wreaths of smoke coming out of the engine. How long will two great, intellectual, and powerful races fight for the dominion of all the villages which are dotting the plain, of the silent fields, of the peaceful valley?

I came down the mountain by a by-road; I looked over the huge Celtic wall, the remains of the Roman road, which went straight over mountains and valleys, and I stopped a moment in an old forester's house. The old soldier is still there. Over his door are the curious horns of the deer, the tusks of the boars he has killed; his gun, which is not a Mauser or a Chassepot, but an old-fashioned gun which he has used for twenty years, and which seldom misses its mark, is carefully oiled, and hangs along the wall. I ask him for some wine; he will receive no pay from a Frenchman. The faithful dog comes and sits by my feet, as if he knew that I was a friend. He is no great politician, my old forester; he knows little about the Hohenzollerns or the Bourbons, or the Republic. He is a child in heart; he is honest and faithful, and he speaks of France as a child does of a mother. Would you have him eradicate from his heart the tender and mystic love which has grown slowly like the trees of the forest? Surely conquest is a horrible thing. The so-called superior races are the modern minotaurs; they devour human beings, human affections; they would justify the sneering irony of a Mephistopheles. The work of centuries is undone in a day on a single battle-field. Wörth is not far off. I will not go to see it. I will not see the green places whose verdure has been made richer by blood. I will roam a little more among the ruins, see the curious old castles, Andlau, Spesburg, Giesbaden. There there is no longer any trace of violence, though all these places were the abode of violence; their dormant ruins speak of nothing but peace, and silence, and rest. Where are the fiery hearts which once beat under the massive walls? Nothing after all remains, nothing is eternal, but nature and the memory of those pure virtues, those lofty sentiments, which in this region have been for centuries embodied in the name of Odile. Fiction is sometimes more true than history.

# Correspondence.

## THE NEW GERMAN ECONOMISTS.

To the Editor of The Nation:

Sir: In your article entitled "The New German Political Economy" (No. 532), I think you hardly do justice to the position and the claims of this school. In the first place, it is represented as being an outgrowth of the national awakening after the war of 1870, and I think most readers would understand it to be of very recent origin, and probably composed of very young men. Now, the copy of Roscher's 'Nationalökonomie' which lies before me is the ninth edition, published in 1871; the preface is dated Leipzig, 1854. That is to say, instead of being a young doctrinaire, Roscher has been for over twenty years the professor of political economy in the leading university of Germany, and is universally recognized as the first economist of Germany, and, since the death of Mill and Cairnes, I think he would be pretty generally recognized as the first economist living.

Again, I take exception to your expression: "It [this school] fancies it has made discoveries which must reduce Adam Smith and all his followers to comparative insignificance." I have never met with any such claims on their part. The following is what Roscher says of Adam Smith in his latest work, 'Geschichte der Nationalökonomik in Deutschland,' one of the great series of histories of the science published by the authority of the Historical Commission of Munich: "The entire history of doctrines of our science is to

be divided into two principal groups, before and after Adam Smith; so that everything earlier appears as preparation for him, everything later as development of him or opposition to him." Again: "Of the universal [*welthistorische*] tendencies which control the second half of the eighteenth century, six were harmoniously incorporated in his personality as in no other—so strong, so symmetrical, and so individual at the same time, that he may rank as the most important representative of this combination. I mean the new philosophy, scientific experimentalism [*Empirismus*], the advancement of material interests, the striving for political freedom, for social equality, and for cosmopolitan humanity." (I quote from a review in Sybel's *Historische Zeitschrift.*)

That the present German school has left behind it many of the practical conclusions of Adam Smith and his followers is no more true than that the leading English economists have done the same. They do not, however, like Mr. Carey, reject the foundation, but build a new structure upon it. Mr. Cairnes rejected the doctrine of *laissez-faire* quite as emphatically as Roscher. "There is no security," he says, "that the economic phenomena of society, as at present constituted, will always arrange themselves spontaneously in the way which is most for the common good. In other words, *laissez-faire* falls to the ground as a scientific doctrine" (Essays, p. 250). Again: "The policy in question, the policy of *laissez-faire*, has been steadily progressive for nearly half a century, and yet we have no sign of mitigation in the harshest features of our social state" (p. 249).

This truth, so strongly expressed by Mr. Cairnes, is the one seized upon by the German economists as the warrant for their view that the prevailing system is "wholly worthless for the explanation of the recent social problems" (Adolf Held, in the *Historische Zeitschrift*). I admit that, in their reaction against it, they appear sometimes to undervalue its scientific value as a basis for their practical discussions. But it is only "*appear*." I think the English economists themselves—certainly Mr. Mill or Mr. Cairnes—would be satisfied with the following statement as to the function of selfishness in human actions, by Prof. Schmoller of Strassburg, a younger and more radical thinker than Roscher: "Selfishness in political economy resembles the steam in the steam-engine; I cannot tell what it accomplishes until I know the pressure under which it works" ('Grundfragen des Rechts und der Volkswirthschaft,' p. 38).

This gives the key to the method of the "historical" or "realistic" school. It does not deny the conclusions of the English economists, admitting their premises. (Roscher pronounces Ricardo and Malthus "investigators and discoverers of the very first rank.") But it insists upon it that these conclusions are in practice far less near the reality than the English economists are accustomed to assume; and here Mr. Cairnes agrees with them. It follows, as Schmoller says, that "every practical economical discussion must start with the character of the people in question, the habits and conceptions within the period, the rank, the profession, and the place of which it speaks" (p. 37). So Mr. Cairnes, speaking of the science: "Its utility, with a view to the practical requirements of a country, will entirely depend upon what those requirements happen to be" ('Essays,' p. 241). Therefore, Schmoller goes on to say, economical freedom can only be a presumption "when one thinks of particular men, with particular habits and particular training. Adam Smith's 'Political Economy' did this. It argued from the educated trading middle-classes of England and Scotland in Adam Smith's time; it saw that from the abolition of obsolete economical laws dating from the Middle Age proceeded an active development of powers. Therefore, it said without qualification, constraint cripples public economy, freedom is its element, advances and frees every power. It was an exaggerated generalization of an unquestionably correct observation" (p. 47). Precisely what M. de Laveleye says, in the article referred to by you: "The free-traders defended a just cause with bad arguments, and a useful reform with lame axioms."

W. F. Allen.

Madison, Wis., Sept. 12.

---

[We have also received a letter on this subject from Mr. Brinton Coxe, which is devoted to the defence of Dr. Roscher, by means of extracts from his latest work, against the charges of socialism, of undervaluing Adam Smith or the English economists, of discarding deduction in economical enquiries, and of substituting State interference for competition. Although we have put it in type, we are unable to find space for it, and think it hardly necessary to publish it. We were wrong in using Roscher's name so prominently as the representative of the new school; we did so by way of meeting the extraordinary conclusions which the writer in the *Financial and Commercial Chronicle* had drawn from his latest book, which we had not seen. But quotations from his works do not furnish an answer to what we have said about the new German political economists. Their nickname of "Katheder-Socialisten" does not mean that they are supposed to advocate the abolition of property, but that they concur with Lasalle and Karl Marx and Bebel, and other socialist chiefs, in greatly enlarging the sphere of the state in the matter of regulating industry. We ought to add that our article was suggested by and took as its text M. Laveleye's recent exposition of the German doctrines in the *Revue des Deux Mondes*, and in proof that we have not exaggerated in describing his position, we may cite M. Baudrillart's account of it in the last number of the *Journal des Economistes*, which has reached us since last week, where he says that he (M. Laveleye) has proclaimed that "political economy, the old orthodox political economy, of the Smiths, the Says, and the Bastiats, is dead, has closed its life, and this sentence of death appears to him perfectly legitimate." "For M. Laveleye nothing remains of the old political economy. It is an error. Its principle even is as faulty as its method. It will not do to amend it or complete it; it must be given up."

Touching the time when the new school took its rise, all doubt on that point was set at rest at the last meeting of the Société d'Economie Politique in Paris, by the statement of Herr Engel, the Director of the Prussian Bureau of Statistics, that he was himself one of its founders; that it is not protectionist, but confines itself to maintaining the right of the state to interfere in social arrangements, and that it took its rise in his Bureau at Berlin, attached to which there is a sort of college, in which young economists pursue their studies in the light of accumulated facts; and he gave as a reason why it was not more fully represented in the Parliament, that it was founded, or rather organized, *after the late elections*. Its notions of the functions of the state are very fully set forth by M. Laveleye. Herr Engel's story was confirmed by Professor Meitzen, of the chair of Statistics in the University of Berlin.

Coming to Professor Allen's own account of the creed of the new school, we find in it a striking illustration of the danger of trying to discuss anything by means of short quotations. Mr. Cairnes by no means rejected the doctrine of *laissez-faire* as worthless or dangerous. In the essay from which Professor Allen quotes, he is discussing the cause of the indifference or hostility of many modern reformers to political economy, and describes their conception of political economy as that of a gospel which undertakes to show, and this only, "that wealth may be most rapidly accumulated and most fairly distributed by the simple process of leaving people to themselves," but which, if this is all it has to say, has been preached enough, and must now give way to something more fruitful. But he "denies altogether the correctness of this view of the science," and "proceeds to explode it" by showing that "the maxim of *laissez-faire* has no scientific basis, but is at best a mere handy rule of practice." He then points out how far short it has fallen of realizing the expectations which its earlier advocates entertained of its working, and what he says on this point is very sound and just, but resembles closely what might be said of the Christian religion, of universal suffrage, of popular education, and various other means, small and great, resorted to at different times by enthusiastic men for the promotion of human happiness, and what we have at various times ventured, with our foreheads in the dust, to say in these columns to the frolicsome friends of woman suffrage.

"Human beings," he says, "know and follow their interests according to their lights and dispositions, but not necessarily nor in practice always in that sense in which the interest of the individual is coincident with that of others and of the whole. It follows that there is no security that the economic phenomena of society as at present constituted will always arrange themselves in the way which is most for the common good. In other words, *laissez-faire* falls to the ground as a scientific doctrine. I say, as a scientific doctrine, for let us be careful not to overstep the limits of our argument. It is one thing to repudiate the scientific authority of *laissez-faire*, freedom of contract, and so forth; it is a totally different thing to set up the opposite principle of state control, the doctrine of paternal

government. For my part, I accept neither the one doctrine nor the other, and, *as a practical rule, I hold laissez-faire to be incomparably the safer guide.* Only let us remember that it *is* a practical rule, and not a doctrine of science, *a rule in the main sound*, but, like most other sound practical rules, liable to numerous exceptions."

We here see that citing him a little more fully puts a very different complexion on Mr. Cairnes's position, and there could hardly be a more thoroughgoing declaration than this of hostility to the aims and methods of the historical school. There is nothing in his works to warrant the extravagant assertion of Adolf Held "that the prevailing system is wholly worthless for the explanation of the recent social problems." This is just like the wild talk heard at the Professorial Convention two years ago, and we feel very confident that neither Mr. Mill nor Mr. Cairnes would have adopted Professor Schmoller's account of the economical function of selfishness, "that it resembles the steam in the steam-engine"—that is, that it is a blind, brute, destructive force, unless from the moment of its generation it is confined in a powerful cylinder and managed by a lever and valves. This view of it is one which may find reception in Prussian military circles, but we doubt if any English or American economist could be got to entertain it as a basis for economical deduction. To him selfishness is not and cannot be separated, for the purposes of economical discussion, from the social instinct in man. The consideration of it, as Professor Schmoller describes it, as a naked force, belongs to criminal jurisprudence, not to political economy, and the phenomena it produces are theft and fraud, not production and exchange.

Professor Cairnes's definition of political economy, which is very clear, disposes, too, very effectually of the great German discovery that every country is hereafter to have a "political economy of its own," suited to the character and habits of the people. He points out that political economy is a science, in the same sense in which "astronomy, dynamics, chemistry, and physiology are sciences." It deals with the phenomena of wealth, but does not undertake to show people how to get rich. Astronomy explains the laws which govern the courses of the stars, and dynamics the laws of motion; but the one does not teach navigation, nor the other mechanics. What an economist is occupied with is the explanation of the phenomena of wealth—that is, the phenomena attendant on the activity of man in society in procuring the means of enjoyment. The "bottom fact" of his science is not *laissez-faire*, but the constant, universal, and immemorial desire of man to acquire and possess property, which exists in all countries, and has existed in all ages, and produced thieves and pirates first, and then merchants and manufacturers. The existence of this is his fundamental assumption, just as the uniformity of nature is the fundamental assumption of the astronomer or chemist. Of course this desire works under different conditions in different countries, or, in other words, the phenomena of wealth are different, and the subjects of economical investigation, therefore, are different in different parts of the world; but the science does not change when it crosses the sea any more than the dynamics relied on by an engineer making a railroad in a highly cultivated district in England, would differ from the dynamics relied on by an engineer making a railroad in a Louisiana swamp. The fact is that the "Realists" are making a great outcry about nothing. They have made no important discovery, but they may do a great deal of mischief by strengthening and diffusing amongst the vast mass of ignorant and unreflecting men who are now coming into possession of political power all over the world, the notion that wonderful changes may be effected in the conditions of human existence by the vigorous use of governmental machinery. It is here that, we verily believe, the weak spot of our modern civilization is to be found—the seat of the disease which may one day bring the race back to the barbarism from which it emerged, for the theory might fatally weaken that reliance on individual character through which human progress has been mainly made. Considering the difficulties which have attended this progress for ten thousand years, and must for ever attend it, one can hardly refrain from smiling when told by social philosophers that *laissez-faire* has been tried for half a century, and the poor and unhappy are still numerous.—Ed. Nation.]

## THE DUNCAN AND SHERMAN FAILURE.

To the Editor of The Nation:

Sir: Knowing full well that subscribing for and admiring your paper confers not the slightest right to attempt influencing in any manner your editorial opinion, yet I do believe and confidently expect you to coincide that in the recent failure of Duncan, Sherman & Co, of your city, you have hitherto conspicuously neglected the finest opportunity that has ever occurred on this planet of emphasizing the command, "Thou shalt not steal." I have taken great interest, and the pleasure it gave me has been a sufficient reward, in commending to my orthodox friends your manly and fearless exposure of financial, political, and religious frauds, in contrast with the moral cowardice of the pulpit and religious press upon those subjects.

My friends now ask me for an explanation of your marked silence upon and exemption from condemnation of this most atrocious fraud of all; and I have none to give. As a Californian, I hope you will not permit so fine an opportunity to pass of contrasting the life and, under the circumstances, manly death of Wm. C. Ralston with the head of the house referred to, who, knowingly, for years lived ostentatiously upon money not his own, and yet continues to cling to life with the proverbial tenacity of those who "do the state some service" in our penal institutions.

Yours respectfully, J. R. Wilson.

Pittsburgh, September 6, 1875.

[We have received several letters like the above. Some of them we have answered privately, but this begins to be tiresome. We will now say, once for all, that, in the first place, the proprietors of this paper are creditors of Messrs. Duncan & Sherman, for a small amount, it is true, but still for a sufficient amount to make it improper that we should harangue the public on the moral aspects of their failure. In the second place, there has been nothing in the practice of the *Nation* with regard to such cases to make it singular that we should now refrain from extended comment. We are not Commissioners in Bankruptcy. We have no machinery for overhauling bankrupt estates, and make no pretence of passing on the rights and wrongs of the principal failures of the day, unless they become the subjects of judicial investigation. To undertake anything of the kind would be ridiculous. We have commented, it is true, in severe terms on several commercial disasters, but simply because they had some bearing on public affairs; on Jay Cooke's, because he had been made the Government banker, by a jobbing transaction, and had sold large quantities of worthless securities through fraudulent connivance with a portion of the religious press; on Clews's, because he had also been made Government banker in place of the Barings, through another job; on General Frémont's Texan railroad bonds, because the French courts had sentenced him to five years' imprisonment for swindling; on the Emma Mine fraud, because the American Minister in London had played the part of a stool-pigeon in it. But we do not keep an eye generally on the bankers and trustees of the country, to see that they do their duty; we do not examine their assets or their books, when they fail, to see whether they have been reckless or fraudulent. Cases of failure of course might occur the interest in which would be so great and their consequences so serious—such, for instance, as Overend & Gurney's in England—that they would properly and necessarily become topics of newspaper discussion; but we doubt whether we should have taken any such view of the Duncan & Sherman case, even if we had not been disqualified for preaching on it by personal interest.—Ed. Nation.]

## TOO MUCH IN EARNEST.

To the Editor of The Nation:

Sir: I wish to call your attention to an article in the 531st number of the *Nation*, page 142, Sept. 2, 1875, in reference to the Georgia insurrection. know nothing about this insurrection except from the accounts of it I have

read in the papers I take, and I have certainly not seen in any of them anything concerning it that in any way justifies or excuses the language of the article referred to. The charge of Judge Johnson to the grand jury, which contains, as you say, the evidence of the "black-hearted villany" of the South, seems to me to be a very proper one, and was no doubt delivered in all sincerity. I have been a subscriber to the *Nation* about three years, and have endeavored to enlarge its circulation in this section by recommending it to my friends, believing it calculated to accomplish much good, particularly among the educated and better-informed class of our people. I had been induced so to think from the ability, statesmanship, and morality its pages have hitherto displayed, and I feel disappointed and mortified at the littleness, injustice, and malignity the article referred to evinces. If the circumstances of this insurrection have been magnified or misrepresented, show your readers wherein. Give us the facts, and be certain that in the statements you make you state the truth, the whole truth, and nothing but the truth. The article referred to, as its animus evinces, is based on suspicion and malignity, without any evidence whatever to support its assertions or to justify its language. I believe it to be a slander. I judge of the condition of the people of Georgia by what I know of the condition of our people here where I reside. I shall feel constrained to regard the article referred to as a slander until you show to the contrary. If you are neither willing to verify its correctness or to endeavor to counteract the mischief it may do, I wish you to erase my name from the list of your subscribers. I will receive it no longer under such circumstances. I was before the war an Old-Line Whig. I have always been, first and last and all the time, a Union man, but have never voted with the Republican party. I always endeavor to judge and act correctly, and I belong to a class much more numerous in the South than many of you people of the North seem to suppose. If you will visit this section, you will be perhaps surprised at the hospitality, patriotism, and forbearance of our Southern "banditti," and I think I can convince you we neither fear to be "observed" nor think it "necessary to dissemble." I will show you what we do fear, and I feel persuaded you would return to your Northern home a wiser if not a better man.

I am respectfully yours, etc.,

WM. G. WILLIAMS.

RODNEY, M pt. 13, 1875.

[The above is one of the comic results of a paragraph which we fondly imagined that any regular reader of the *Nation* at least, of average intelligence and moderate capacity for joking, would perceive to be ironical. We presumed, in fact, that this would be so plain to anybody who knew what our position about the South had been for the last two years, that we struck out in the proof, as too broad, a closing line which expressed the opinion that Judge Johnson had gone home, after the trial, and supped on a negro baby. We now begin to think, however, that if we had left this in, so far from exciting the suspicion of Southern editors as to the real nature of the paragraph, it would have increased their fury, and led them to vindicate Judge Johnson against the charge of cannibalism. As it is, we have had a half-hour of hearty enjoyment in reading some of their articles. The Georgia *Daily Times* ascribes our account of the trial to the bitter memory of Bull Run retained by "the hospital rat" who wrote it, and who, he supposes, still writhes when he thinks of his long run into Washington with "the Black Horse Cavalry" at his heels. It actually puts into italics the *Nation's* assertion that "the black-hearted villany of the South comes out very plainly in Judge Johnson's charge," which was followed immediately in our columns by a description of the charge, showing it to be, in our opinion, a model of its kind:

"He begins," we say, "by telling the Grand Jury that he has been advised of a 'plot of insurrection,' and has ordered a full investigation into all the circumstances. He then gives legal definition of insurrection and attempts to incite insurrection, cautioning the jury not to be guided by suspicion, rumor, or hearsay. He warns them, too, against exaggerating the enormity of the crime, or allowing any consideration of color to affect their minds, reminding them that they must 'ignore the fact that the accused are negroes' or 'that they were ever slaves.'"

It has been maintained that there are men who are completely devoid of humor, a view which we have never shared; but a few more experiences of this kind would shake our confidence, particularly as a tribe called Weddahs has lately, it is said, been discovered in Ceylon, who never laugh, and do not know what a joke means any more than a horse—showing, if the story be true, that this sense does not necessarily enter into what may be called the human element in man's nature.—ED. NATION.]

# Notes.

ROBERTS BROS., Boston, have nearly ready the fourth volume of Miss Alcott's 'Little Women' series, to be called 'Eight Cousins'; also, a translation from the French of 'Madame Récamier and her Friends'; 'The Ship in the Desert,' a poem by Joaquin Miller; and Hamerton's 'Round My House' and 'Etching and Etchers.'——Lockwood, Brooks & Co. publish next month 'An American in Iceland,' by Prof. Samuel Kneeland, of the Massachusetts Institute of Technology. The millennial celebration of August, 1874, is described, and there are notes on the Orkney, Shetland, and Faroe Islands.——Hurd & Houghton announce 'Japanese Art,' by James Jackson Jarves; and 'Doings of the Bodley Family in Town and Country,' by Horace E. Scudder—a child's book.——Harper & Bros. announce 'Select Dialogues of Plato,' in English; 'The Catskill Fairies,' by Virginia W. Johnson; and 'John Todd,' an autobiography, edited by John E. Todd.——D. Appleton & Co. will republish Darwin's 'Climbing Plants and their Habits.'——'Forty Years in the Turkish Empire,' being memoirs of the late Rev. William Goodell, D.D., is in the press of Robert Carter & Bros.——Macmillan & Co.'s list includes the 'Austrian Arctic Expedition,' by Lieutenant Payer; the complete poems of Christina Rossetti; and the 'Makers of Florence,' by Mrs. Oliphant.——Nelson & Phillips will publish 'Summer Days on the Hudson,' by Daniel Wise, D.D.; and 'North Pole Voyages' (American), from the second Grinnell Expedition to that of the *Polaris*, by the Rev. J. A. Mudge.——'American Literature,' by Prof. Moses Coit Tyler, is announced by G. P. Putnam's Sons.——Scribner, Armstrong & Co. publish during the coming season 'Impressions of London Social Life,' by E. S. Nadal; Dr. Holland's completed story of 'Sevenoaks'; two new volumes of the Bric-à-brac Series—'Personal Recollections of Lamb, Hazlitt, and Others,' and 'Constable and Gillies'; a poem, 'The New Day,' by Richard Watson Gilder; and—what will be good news for the young folks—an entirely new and illustrated edition of 'Hans Brinker,' and a new volume by Mr. Frank R. Stockton, 'Tales out of School,' a companion to his delightful 'Roundabout Rambles.' Among the foreign reprints of this house we note Vol. IV. of 'Chips from a German Workshop'; 'Babylonia,' by George Smith; Jules Verne's 'Mysterious Island'; and Louis Rousselet's 'India and its Native Princes,' an expensively printed and illustrated book of travel.——Sheldon & Co. publish 'Memoirs of Dr. Eliphalet Nott,' by Prof. Tayler Lewis; and 'History of Ancient and Modern Philosophy,' by Prof. Joseph Haven.

—"T. B." writes us from Rochester: "Possibly the subjoined advertisement may have some interest as a contribution to the enquiry touching honorary degrees, suggested in one of your latest numbers. It is cut from the *Architect* (London), in which it has stood, with some changes of form, but the same in its fragrant substance, for some months past":

UNIVERSITY DEGREES.—Architects, Engineers, Builders, and other Scientific Gentlemen desirous of obtaining a learned degree in Honoris Causa from a Foreign University, should communicate with "Medicus," 46 King Street, Jersey, England.

The explanation of this, however, has just appeared in the London *Times*, and reveals not German but American swindling. "Medicus," on being applied to by a Mr. Sparkes (who suspected fraud) for a prospectus, offered to procure him the degree of Ph.D. from the "American University of *Philadelphia*," and, as he was a B.A. already, to throw in the M.A. "without any increase in the charges. The total cost of a promotion, *in absentia*, is £20, inclusive of a handsome diploma and certificate of registration." The institution in question, which aimed to be confounded with the University of Pennsylvania, had its charter revoked for these practices some years ago.

—The *Geographical Magazine* for September contains a large colored map of Paraguay, compiled by Keith Johnston during his recent visit to that country. Mr. Johnston accompanies it with the first part of an account of his journeys between the Paraguay and Paraná Rivers. His descriptions of the natural scenery make a pleasant impression on the mind of the reader, but this is offset by the suggestions (rather than pictures) of the desolation caused by the war in all the towns and settlements of the Dominion of Lopez. The depopulation sometimes amounts to extinction, and such have been the vicissitudes of the country that an affix *-cué* (as in Casalcué, Ramocué, etc.), signifying abandoned, indicates places either now or at some time utterly deserted. El Carmen, near the Paraná, which, twenty years ago, had an estimated population of 1,000, now has but two habit

able houses, and counts but eleven people. Close by it, on the river, Encarnacion, founded in 1614, and once a leading *reduccion* of the Jesuit missions, was well filled before the war, but most of the inhabitants have crossed the river into Argentine territory, and only about a dozen houses continue to be occupied. Even more melancholy was the lapse, due to a different cause, of a German colony planted near Jaguaron, not far from Asuncion. It lay in the midst of a dense forest, and "the conspicuous numbers along the path marking the lots of forest to be cleared are now almost the only signs of the colony remaining; but two or three indefatigable Teutons have, at a prodigious expenditure of labor, cleared little plots of ground in this wilderness, and live there in spite of all difficulties." These difficulties are the heavy timber, for which there is no market, and a total absence of water. In company with the Brazilio-Paraguayan boundary commission, Mr. Johnston arrived at the last camp of Lopez, in the northeastern corner of the state, and he concludes his paper with this mournful image, which reminds one of the camp of Varus visited by Germanicus:

"The site of the camp . . . . . is still strewn with the undisturbed wreck of everything that belonged to it: carts, broken guns, and camp-furniture of every sort, with numbers of skeletons, lie scattered round. The sufferings of this last remnant of the Paraguayan army may be realized in following the track between this camp and the former one of Panadero, for under every shade-tree along it are the untouched bones of men who have lain down to die of wounds, weariness, or starvation."

—We hope the Agricultural Bureau is watching the experiment of Eucalyptus globulus plantations in this country. Its northern limit is a question of great interest and importance, and cannot be solved, doubtless, for a number of years. The tree does remarkably well in California, and we know of its having been set out extensively in Arkansas. So rapid is its growth that possibly as timber it may be found more profitable to raise than grains or fruit, even if not allowed to attain its full growth; while its medicinal properties are doubtless as efficacious in its shrub-like condition as at a riper stage of development. At the same time that the blue-gum is being tested, experiments should also be made of other species of the eucalyptus, especially as they are known to be hardier than the more familiar E. globulus. Signor Branchi, formerly Italian vice-consul at Melbourne, mentions several in a letter to the Florence *Nazione* (July 10). He had seen in Australia, and especially in Tasmania, eucalypti growing on the highest mountains, on which the snow lasts for months in the spring. Naturally they were of a shorter growth than their giant brethren, but live they could and did. Enquiry of Baron von Mueller, director of the Botanic Garden at Melbourne, resulted in the naming of an abundant variety—coriacea, alpina, coccifera, vernicosa, urnigera, stricta, etc.—which endure the frost and flourish up to 1,500 metres above the sea-level. Mueller believed it possible to make them at home on the lowest slopes of the Alps. The rage for the blue-gum, however, has caused it alone to be an ordinary article of commerce, the other species being very costly and hard to procure; and Signor Branchi recommends his countrymen to send out a special collector to Australia and Tasmania to save expense. With its facilities, our Agricultural Bureau might certainly obtain the supply needed for trial in this country, and we again call its attention to the subject.

—A New Yorker, Mr. James Bruyn Andrews, has occupied himself while abroad in preparing a grammar of the Mentonese dialect ('Essai de Grammaire du Dialecte Mentonais, avec quelques contes, chansons, et musique du pays.' Nice: 1875). He states in his preface that no grammar exists for any of the patois from Marseilles to Genoa, even including the large cities. At most some vocabularies or dialectic specimens can be found. The dialect of Menton is eminently one of transition between the French and the Italian, and though it would appear to be difficult of acquisition, it can be read without much difficulty by any one familiar with the two languages from which it is derived. Mr. Andrews contrasts it in sundry particulars with the dialects of Nice and Genoa; it is decidedly less Genoese than that of Monaco. Its range is confined to the canton of Menton, where it varies but little from that spoken in the town itself. It certainly offers a very interesting study in comparative philology. The Latin original occasionally asserts itself somewhat unexpectedly, as in the diminutives *fremenela* (*frema*, femme, woman), and *omenet* (*ome*, homme, man), where the lost *n* of *feminam* and *hominem* reappears; and in *nova* and *nove*, feminine singular and plural of *nou* (sing. and plur.), *novus*, new. Sometimes the vocables go in pairs, between which the choice is indifferent, as (from the Italian) *en giue*, and (from the French) *en garson*, a young man. Mr. Andrews gives a considerable vocabulary of the commonest names, a list of conversational phrases, and several pages of compositions in prose and verse. Those in prose are absurdly amusing; to some of the songs Mr. Andrews has added the music, and it is pretty enough. The weather-sayings of the Mentonese have the piquancy which they are apt to have among all peoples. Thus, of April it is said: "Abri a trenta giorne, e se pioghessa trenta en, no faria ma a nuscen" (April has thirty days; and if it should rain for thirty-one nobody would be the worse for it); and of September: "A volp voe che Setembre aughessa 366 giorne" (Reynard would be glad if September had 366 days). Mr. Andrews has been so unfortunate with his printers that one cannot help thinking that the typographic art in Menton must be in the same transition state as the dialect.

—The Benedictine Abbey of St. Blasien, in the Baden part of the Black Forest, was formerly rich in manuscript treasures. When the French were harrying the country in the early part of this century, most of the manuscripts were carried away from the abbey for security by the monks, and taken to the monastery of St. Paul, near Klagenfurt, in Carinthia. What manuscripts there were left in St. Blasien probably found their way to the Court and State Library at Carlsruhe. We are glad to learn from a German correspondent that there is a chance of ascertaining, with some considerable degree of precision, just what manuscripts there were in St. Blasien. Dr. Alfred Holder is now ransacking the library of St. Paul in search of manuscripts, and particularly of catalogues of manuscripts. Dr. Holder's sagacity and his skill in palæography make it certain that if there is a clue to anything valuable in the library of St. Paul he will get hold of it.

## BANCROFT'S NATIVE RACES OF THE PACIFIC STATES.*

II.

THE second volume of Mr. Bancroft's work relates to the civilized nations of aboriginal America, and the field traversed by it has all the interest of the broader field belonging to the wild tribes, and the additional interest which is found in dealing with that remarkable phenomenon, an independent and isolated "civilization." Of the eight hundred pages which the volume contains, there are only seven or eight in fine type, and these are devoted to an interesting attempt to trace the etymology of the names of the civilized peoples. There are many pages literally packed with references and titles (*e. g.*, p. 501), but these are in the form of foot-notes. All the rest is "plain sailing," and amidst scenery which ought to allure and gratify any intelligent reader. To many, we doubt not, the book will be as a doorway opening toward a new and unheard-of world.

Amongst the great topics of study reserved for the present and succeeding ages, the extinct civilizations of the past occupy a prominent place. Under the guidance of archæology and linguistics, scholars have approached anew the old civilizations of Rome and Greece, to find them teeming with fresh and suggestive facts, and have penetrated through the crust of ages to the still older civilizations of Egypt and Assyria, to find there still other facts to surprise and instruct this conceited modern world. Not a little attention has also been given to the ancient social life of India, China, and Japan; and now the time seems to have fully arrived for a more thorough study of the aboriginal civilizations of America. Ever since the discovery, they have received more or less attention, and we must not forget how much thought and time such authors as Humboldt and Gallatin and Prescott have devoted to them. But it is within a few years past, in such writings as those of Mr. E. G. Squier on Central America and Peru, and those of the late Abbé Brasseur de Bourbourg (to whom, by the way, Mr. Bancroft is at once just and generous, on p. 780), and Mr. Herbert Spencer's second volume of Descriptive Sociology, that these grand developments of American power receive any comprehensive scientific treatment. The volume now under review, to which the fourth (on architectural remains) will be supplementary, constitutes the most substantial and valuable addition to the literature of this subject which the present generation has been permitted to welcome from the press. Until the fourth and fifth volumes are before us, we cannot fairly estimate Mr. Bancroft's work in this special department; but, looking at the present volume in the light of the author's announced design "to present these people as they were," we take pleasure in recognizing the largeness of his knowledge, his very vigorous grasp of the whole subject, and his skill in putting on record what constitutes a brilliant picture of nations which were once great but have vanished utterly.

The civilized nations are divided into two great groups, which for convenience are designated "the Nahuas and the Mayas respectively; the first representing the Aztec civilization of Mexico, and the second the Maya-Quiché civilization of Central America." The manners and customs of each of these groups are described under five separate heads; and let those who are

* 'The Native Races of the Pacific States of North America. By Hubert Howe Bancroft. Vol. I. Wild Tribes; Vol. II. Civilized Nations.' New York: D. Appleton & Co. 1875. 8vo.

sceptical in reference to the greatness of the ancient American civilizations observe what topics are enumerated under each of these divisions, and what the type of life must have been which gave origin to such institutions as these :

"The first may be said to include the systems of government, the order of succession, the ceremonies of election, coronation, and anointment, the magnificence, power, and manner of life of their kings, court-forms and observances, the royal palaces and gardens. The second comprises the social system : the classes of nobles, gentry, plebeians, and slaves ; taxation, tenure, and distribution of lands ; vassalage and feudal service ; the inner life of the people, their family and private relations, such as marriage, divorce, and education of youth ; other matters, such as their dress, food, games, feasts and dances, knowledge of medicine, and manner of burial. The third division includes their system of war, their relations with foreign powers, their warriors and orders of knighthood, their treatment of prisoners of war, and their weapons. The fourth division embraces their system of trade and commerce, the community of merchants, their sciences, arts, and manufactures. The fifth and last considers their judiciary, law courts, and legal officials" (pp. 124, 125).

Is it true, then, that the nations which fell so swiftly before the swords of the Spanish invaders had developed so high an order of life as this—that they had so elaborate a system of government, a social life so rigidly stratified, relations so important with foreign powers, trade and commerce, manufactures, arts and sciences, and a judiciary—to say nothing of their religious ritual and their architectural achievements? "It is my sincere desire," says our author in answer to all such questions, "to present these people as they were, not to make them as I would have them, nor to romance at the expense of truth. . . . Truth and accuracy are the principal aim, and these are never sacrificed to graphic style or glowing diction" (p. 124).

After a preliminary "general view," five hundred pages are devoted to the Nahua nations, and a hundred and seventy-five pages to the Mayas. The chapters in which the various topics are treated are full of interesting writing, but of course we cannot follow the author in his long journey, or even mention the subjects which seem to us specially deserving of attention. As compared with Prescott, Mr. Bancroft has the advantage of a wider knowledge of authorities ; as compared with the Abbé Brasseur, he has the advantage of a steadier judgment and a keener scientific sense ; and in consequence, although possessing less artistic feeling and literary skill than either of these authors, his work is more complete and trustworthy than theirs, and therefore more satisfactory to the conscientious reader. We should be glad, if we had room, to make some extended quotations, showing the author's descriptive power and his skill in analysis and combination ; but we can only refer in a general way to the account of the inauguration of the Mexican kings (in chap. iii.), the description of the royal palaces (chap. iv.), of the city of Mexico and the great temple (chap. xviii.), of the public festivals (chap. ix.), and, for those whose tastes are political and sociological, to the account of castes, land-tenure, etc. (in chap. vi.), of their commerce (chap. xii.), of their war-customs (chap. xiii.), and of their laws and law-courts (chap. xiv.) Not less interesting are the accounts of their arts and manufactures, of their elaborate calendar, of their picture-writing, and of their eloquence and poetry. To many it will convey a quite new impression in regard to the hated Indian race to read such a passage as this :

"Love of flowers was a passion with the Aztecs, and they bestowed great care upon the cultivation of gardens. The finest and largest of these were at Iztapalapan and Huastepec. The garden at Iztapalapan was divided into four squares, each traversed by shaded walks, meandering among fruit-trees, blossoming hedges, and borders of sweet herbs. In the centre of the garden was an immense reservoir of hewn stone, four hundred paces square, and fed by navigable canals. A tiled pavement, wide enough for four persons walking abreast, surrounded the reservoir, and at intervals steps led down to the water, upon the surface of which innumerable water-fowl sported. A large pavilion, with halls and corridors, overlooked the grounds" (p. 575).

And how strange it will seem to some of our readers to find that even the boarding-school life of these ancient "barbarians" was so much like that of to-day in our American cities and villages :

"Annexed to the temples were large buildings used as seminaries for girls. The maidens who were educated in them were principally the daughters of lords and princes. They were presided over by matrons or vestal priestesses brought up in the temple, who watched over those committed to their care with great vigilance. Day and night the exterior of the building was strictly guarded by old men to prevent any intercourse between the sexes from taking place ; the maidens could not even leave their apartments without a guard. . . . . When they went out, it was together and accompanied by the matrons ; upon such occasions they were not allowed to raise their eyes, or in any way take notice of any one ; any infringement of these rules was visited with severe punishment. . . . . They were taught the tenets of their religion ; they also learned how to make feather-work, and to spin, and to weave mantles. . . . . At night the pupils slept in large rooms in sight of the matrons, who watched them closely. The daughters of nobles, who entered the seminaries at an early age, remained there until taken away by their parents to be married" (p. 245).

In another part of the description, however, the resemblance to the boarding-schools of the present day is less obvious, for we read :

"They were obliged to be skilful and diligent in all household affairs. They were taught to speak with reverence, and to humble themselves in the presence of their elders, and to observe a modest and bashful demeanor at all times. They rose at daybreak, and whenever they showed themselves idle or rude, punishment was inflicted" (*id.*)

It will be a surprise also to many to find that this almost forgotten people produced such poetry as this, taken from an ode on the "Mutability of Life," by one of the kings of Tezcuco, which proves to have been not only an ode but a prophecy ;

"And thou, O wise Prince Oyoyotzin,
Mighty monarch, and king without equal,
Rejoice in the beauty of spring-time,
Be happy while spring abides with thee ;
For the day creepeth nearer and nearer
When thou shalt seek joy and not find it.

"A day when dark Fate, the destroyer,
Shall tear from thy hand the proud sceptre,
When the moon of thy glory shall lessen,
Thy pride and thy strength be diminished,
The spoil from thy servants be taken,
Thy kingdom and honor go from thee.

"Ah, then, in this day of great sorrow
The lords of thy line will be mournful,
The princes of might will be downcast,
The pride of high birth will avail not:
When thou, their great Head, hast been smitten,
The pains of grim want will assail them.

"Then with bitterness will they remember
The glory and fame of thy greatness,
Thy triumphs so worthy of envy,
Until, while comparing the present
With years that are gone now for ever,
Their tears shall be more than the ocean"—(p. 495).

In treating of the Central-American nations our author adopts the same general plan, but carries it out on a much narrower scale. Not because he considers the Maya civilization less elaborate or important than the Aztec, but because the available data are much more meagre. His account of the Maya calendar, however, is very full (pp. 755–767), and this is followed by an excellent summary (with illustrations) of what is known of the Maya method of writing, and of what has been done toward deciphering the inscriptions upon the Central American ruins (pp. 767–782). But neither here nor in the "list of authorities quoted" at the beginning of the first volume is there any mention made of M. de Charencey, one of the few enthusiastic laborers on this by-path of science, and the man upon whom the mantle of the Abbé Brasseur de Bourbourg (such as it is) seems to have fallen. Mr. Bancroft has something to say of the relations of these two civilizations—the Nahua and the Maya—to one another ; but, as becomes an author who eschews theorizing, he expresses himself very guardedly. But in thus grouping the civilized peoples in two divisions, he adopts a theory in spite of himself, or, rather, he seems to take for granted what is only an unproved and unsupported hypothesis—that all the civilized nations belonged to one or the other of these two great stocks, and that there were no other independent civilizations within the broad domain which his book covers. Why may we not suppose, for instance, that the civilization of the Tarascos of Michoacan (see p. 108) was as distinct from that of the Aztecs as the latter was from that of the Mayas ? and if so, why treat the two first as if they were one ? It may be said in reply that a wholesale method of treatment was unavoidable ; indeed, the author distinctly announces that his grouping is tentative at best ; but in the detailed account of institutions and customs this fact is sometimes too much lost sight of. Mr. Bancroft expresses, with some hesitation, his belief in the existence of a Toltec epoch preceding the Aztec (p. 98), but he does what he can to break the bondage exercised over many students by the Toltec name, and especially rejects the notion that the Central-American civilization owes its origin to exiled Toltec nations, driven from their home in the Valley of Mexico by incoming barbarians from the north. He claims for the ruins of Copan and Palenque a very high antiquity and an origin entirely independent of any Toltec influence. He believes profoundly in the antiquity of ancient America, for in one place he speaks of the unwritten history of the races he is describing as "reaching back for thousands of ages," where the phrase "thousands of years" would have answered every purpose.

Mr. Bancroft's second volume—like the first—contains an elaborate introductory chapter. Its title is "Savageism and Civilization," and, as it fills eighty pages, it may almost be considered a treatise by itself. It is a dissertation on the causes and conditions of civilization, and is interesting

not only by virtue of its contents, but as showing how thoroughly the author has explored his subject, and upon how broad a basis he placed himself in his preliminary studies. Under the leadership of such thinkers as Spencer, Bagehot, Draper, and Youmans, he goes back to "primal principles," and discusses such themes as force and matter, man as a physical being, the progressional impulse in humanity, the influence of good and evil in the social organism, etc., etc. The subjective conditions of human progress are fully considered from this starting-point, that "in every living thing there is an element of continuous growth; in every aggregation of living things an element of continuous improvement"; and then the objective conditions are taken up (such as climate, the conformation of the continents, etc.), with special reference, of course, to Mexico and Central America. The theory of Buckle, that civilization is invariably the product of heat and moisture, is severely criticised, and the endeavor is made to reach a broader view. We have no serious complaint to offer of the presentation made by Mr. Bancroft of this difficult subject, but throughout his dissertation his devotion to the new evolutionary philosophy is perhaps too marked to suit the taste of orthodox readers.

It was our intention to speak of the bibliography—containing the names of twelve hundred authors—prefixed to the first volume, if only to express surprise at some of the omissions we have observed in running the eye over it. But we must hasten to a close, saying a word or two in conclusion in regard to our author's style. One virtue he possesses in a high degree—perhaps we should say in excess, when we consider that he writes for a promiscuous public—namely, great plainness of speech. There are certainly a good many passages which anxious mothers would hesitate to lay before the eyes of their children. But this plainness of speech is partly the offspring of that straightforward and business-like method which characterizes all the author's work. There is very little of ornament and not a single circumlocution in these sixteen hundred pages, but on every page we find the impress of an earnest and busy thinker, who in all his utterances aims straight at the mark. He is not sufficiently dominated by the æsthetic sense, so that he glides far too easily into newspaper English, and occasionally is guilty of a grammatical blunder; but upon the whole his style is good, because it is so well fitted for his purpose. We intended to specify a few of the solecisms and instances of cheap rhetoric which disfigure these elaborate volumes, but in view of their many excellences it seems a specially ungracious task to do so, and we refrain.

In leaving Mr. Bancroft's book, we desire to express explicitly our thanks for what he has done for the science of man, and especially for American ethnology and history. "Whatever their exact status in the world of nations," says our author, speaking of the Nahuas and Mayas, "they are surely entitled to their place; and a clear and comprehensive delineation of their character and condition fills a gap in the history of humanity." In the education of the future, a place will at length be given to ethnological studies, and the aboriginal condition of America will then occupy more than a few preliminary pages in our historical text-books. The American people, although the offspring of the Old World, will learn to take delight in New-World history, and, although heirs of the Christian civilization of the Orient, they will turn with quickened interest to the vanished civilizations of the West. For the change which must eventually come, the present work will do much to prepare the way.

## NEW NOVELS.*

IN attempting to make a romance of the tolerably familiar biography of Angelica Kaufmann, Miss Thackeray's touch seems to us to have lost its usual fineness. The story is a pretty one in itself, but Miss Thackeray has not succeeded in giving it either the vividness or the coherence that we look for in a novel. It is part of her skill, generally, to remind the reader, lightly, of certain tones, certain half-tones, in the style of the author of 'The Newcomes'; but in so far as 'Miss Angel' suggests in any degree the minor graces of Thackeray's style, it suggests them to its disadvantage. Miss Thackeray emulates her father here, not perhaps in his most successful, but at least in his most difficult attempts. When he put Addison, Steele, Swift, Washington, Johnson, upon the stage, he was not at his best; but never, perhaps, was there more reason to notice the charm of a style which could carry off even a failure. Miss Thackeray deals with several persons registered in history not long since, but she has not made their images more lifelike than she found them. They strike us as rather pale and tame, and they are embedded in much discursive allusion, of a sentimental sort, in which a certain falsetto note has not always been evaded. Miss Thackeray is decidedly a writer, and she often phrases things in a very charming fashion, but she occasionally suffers herself to fall into a certain rhetorical amateurishness. An example of this presents itself in the opening lines of the book, where she tells us that Angelica's "little head is charmingly set upon its frame." What is the *frame* of a head? The analogy that the word suggests strikes us as imperfect. Miss Thackeray is very fond of description, but her descriptions are often fatally unbusinesslike. There is a general flashing and glowing and streaming and melting, but in the midst of it all rarely a definite image. If Nature, with Miss Thackeray, is meant to be merely incidental and parenthetic, we have rather too much of her; if she is meant to be important and essential, she is too vague and desultory. The author of 'Miss Angel' has grace, humor, warmth, literary feeling, but she tells her tale too much by mere allusions.

There are doubtless now living many well-informed people who have never heard of Mrs. Oliphant, but we can assure them that Mrs. Oliphant and her writings are among the most extraordinary literary phenomena of the day. This lady's fertility has long been a familiar source of amazement to us; she turns off, if we are not mistaken, her half-dozen works a year. The most singular part of it is that they are very good; it is not mere speed; it is speed and safety too. You open 'Whiteladies'—the latest, we were going to say, but we will by no means answer for that—you read half-a-dozen pages, and you feel like laying down the book. You see what it is—fiction by the square yard; its portentous prolixity tells you that. The author is writing so fast that she has no time to choose; she must take everything that comes. Mrs. Oliphant takes everything, and tells a very long story, but the stream of improvisation is so well under her control and flows in so clear a current that she is able to offer us a very fair average brilliancy. You feel at the end of your half-dozen pages that you know the mechanism, and declare that you don't want machine-made entertainment; that this sort of thing can possibly have no illusion. But your eye wanders further; it skims and skips; and presently you find you are mildly interested. You go from one chapter to another, you turn the pages, the even current bears you along, and at the end of an hour you are actually reading 'Whiteladies.' You can have done both better and worse—worse, certainly, vastly worse, if you pick up a novel of the day at hazard. Practice makes perfect; Mrs. Oliphant has prodigious fertility and fluency, and, considering the quantity, the quality is quite remarkable. 'Whiteladies' is the story of an old country-house of Henry VII.'s time, and of the surreptitious attempt of an amiable spinster to introduce a false heir. False heirs in novels are a trifle stale, and old country-houses (which, it is true, are not always so prettily described as this one of Mrs. Oliphant's) have not the glamor they once possessed; but there was some novelty in the idea of making a comfortable elderly lady of the type of Miss Susan Austin perpetrator of a serious penal offence. We would not have had her pay the full penalty of her indiscretion, but we cannot help thinking that something more interesting in a dramatic way might have been made to come of it than her confession, as it is here related, and her placid tea-drinking life afterwards. 'Whiteladies' strikes us as having been written from page to page, without a plan, and we imagine that when Mrs. Oliphant began to relate Miss Susan's fraud she had very little idea whether she would make it a tragedy or a comedy. The drawback of this inexpensive improvisation has been that her pages are filled with persons whom she is quite at a loss how to dispose of, at the same time that, although prettily enough sketched, they are not as mere portraits sufficiently entertaining to justify themselves. The whole story moves in the Austin family, some of whom it has been the author's fancy to make Belgian shopkeepers, and some others French gentlefolk. We incline to believe that, if she had allowed herself time to think, she would not have created this complexity of foreign races. It is very well and very picturesque that the baby whom Miss Austin attempts to smuggle into the family should be Belgian, but we do not see what was gained by making the rightful heir two-thirds a Frenchman. His sister is the youthful heroine of the tale, but it is hard to imagine a heroine whose position should be more of a sinecure. Of course, at the worst, Mrs. Oliphant can marry her, but this, under the circumstances, is a scanty service. Why, too, should Giovanna, Miss Austin's accomplice, who pretends to be the mother of this interpolated baby, be three-quarters an Italian? The colors in Giovanna's portrait strike us as very much mixed, and all this imbroglio of nationalities seems decidedly arbitrary. The book is clever and readable, however, and decidedly superior to most current novels by female hands. Mrs. Oliphant can write English, though she has some rather foolish mannerisms, and her style conveys a suggestion of a greater general intellectual force than is now usually thought requisite for prosperous novel-writing. But she constantly gives us an impression that she might do better if she would suffer her ideas to ripen. We may be

* 'Miss Angel. By Miss Thackeray.' New York: Harper & Bros. 1875.

' Whiteladies. By Mrs. Oliphant.' New York: Henry Holt & Co. 1875.

wrong, however, and this diffuse, superficial, occasionally slipshod Mrs. Oliphant may be, on the whole, the best Mrs. Oliphant possible. We confess, however, that as we read we were conscious of the importunity of two alternating questions: Is this a writer capable of finer things, jaded and demoralized by incessant production? or is it a writer in whom inspiration naturally flows thin, who has thoroughly learnt the trick of the trade, and who, in grinding out a smooth, tame, respectable novel, is simply fulfilling her ideal? We gave it up, as the phrase is, but the problem in its way was interesting, and it helped us through 'Whiteladies.'

The author of 'Wyncote' has much less practice and facility, but we are by no means sure that there is not more illusion in her simple and shrewd little narrative than in the clever amplitude of the tale we have just noticed. 'Wyncote' is, indeed, a very pleasing little novel; it is what young girls call an extremely *pretty* story. It looks like no great things at first (especially when one finds Mrs. Erskine getting the simplest Italian words quite wrong—she has brought her people as tourists to Rome), but as the reader goes on he finds humor and a neat and graceful style, and discrimination of character, and, in a quiet way, considerable art. 'Wyncote' is also the history of an old country-house, with which the fortunes of various persons are more or less entertainingly connected. English novelists are greatly to be envied with their easy abundance of historic manors and legendary halls. Americans are apt to feel that if *they* only had such material they would make no vulgar use of it. Mrs. Erskine's heroine is a young girl who has been brought from Rome, where she was the much-tried daughter of a blind and starving old English artist, to officiate as companion to an ancient lady, under the eye of the latter's daughter, a strenuous old maid of charitable pursuits and a romantic history. Miss Camilla, the old maid, is extremely good, and the author has happily commingled in her composition the disagreeable and the sympathetic. There are various other persons, especially a certain Lydia Ashton, a young lady who "goes in" for the highest æsthetic culture, and who, if she lived in New York or Boston, would be a representative of Morris wall-papers and eccentric dados. She is very well done, her companions are lightly but happily touched, and the story, albeit rather tame, is agreeably and naturally unfolded. It has a compactness and symmetry which denote an artistic instinct, and it is, in a very good sense of the term, a ladylike book.

Mrs. Jenkin has done very much better things than 'Within an Ace,' and we are quite at loss to explain the genesis of this incongruous tale. It treats of a gentleman in Edinburgh who has taken a young girl named "Cattie" to live with him as a daughter. He has several other daughters, one in especial named Tottie, whose conversation consists exclusively in feeble and ill-timed conundrums. To these young ladies comes a French Count, and forthwith proposes to marry Cattie. We had expected, from the début, a quiet tale of life in Edinburgh from the point of view of the author of the 'Heir of Redclyffe,' but we are speedily transported to France, and to the most illustrious society (the French Count's mother, for instance, is near of kin to a reigning sovereign), and entangled among Cattie's matrimonial vicissitudes. We do not profess to have understood them or to have obtained the slightest inkling of Mrs. Jenkin's purpose, moral or dramatic. French counts in English novels are generally very loose fellows, and the ladies who marry them are not to be envied. Mrs. Jenkin apparently has had a wish to rehabilitate an injured race, and she has made her Count the victim of his Scotch wife's naughtiness. Cattie pouts and sulks, distresses her husband, and disgusts the reader. The latter has no clue to her moods, and, to tell the truth, he takes but a languid interest in the tale. He has never got over his surprise at finding that the household in Edinburgh, and Tottie's conundrums, and the enmity borne to Cattie by a certain ill-conditioned Uncle Dan, are all a mere blind alley, leading nowhither, and that he is launched into a pale simulacrum of the usual French novel of matrimonial impropriety. Not that there is any impropriety here: Mrs. Jenkin, to account for Cattie's vapors, hasn't given her the shadow of a lover. She has only given her a pernicious friend, a certain Mme. d'Aiguillon, who treats her to all manner of wicked counsel. There is no knowing, however, what Cattie might have done in consequence, if the story had not suddenly terminated. Mrs. Jenkin relates all this incoherent stuff with a vivacity and assurance worthy of a better cause.

The general difference between English and French novels is that the former are obviously addressed in a great measure to young unmarried women, and that the latter directly count them out. The strength of each species, we think, lies on the whole in their adhering to this natural division. M. André Theuriet apparently thinks otherwise. He has written a novel which (we suppose) a *demoiselle* may read, but which, in spite of its having originally come out in the *Revue des Deux Mondes*, will not be found remunerative by sterner minds. A French novel pitched in the English key is apt both to forfeit its characteristic charms and to miss the homelier graces of our own school. This has been the fortune of M. Theuriet, who has not succeeded any more than several cleverer Frenchmen before him in drawing a tolerable portrait of that familiar figure in English fiction, the young girl who combines liberty with modesty. M. Theuriet, like his predecessors, loses no time in telling us that this and that and the other point in his heroine's carriage and conversation were very "chaste." From the moment that we have to be assured and reminded of this circumstance, the illusion, for ourselves, is gone. We had no idea that that thing of pernicious possibilities, a "French novel," could be so flat and pointless as 'Le Mariage de Gérard.'

M. Gustave Droz, after being for several years the most brilliant of the younger French story-tellers, has passed into an unaccountable eclipse. With 'Les Etangs' he only partly emerges from it; for if the story is more readable than the one which preceded it (the inconceivable 'Femme Gênante'), it owes this merit to its not really being a story. The author has laid his hand upon some curious old letters, and he publishes them in a slender fictitious setting. Or are the letters, too, possibly an invention of his own? In this case, 'Les Etangs' would be very clever, and yet be still very inferior to the works which made its author's fame.

The first fifty pages of 'Mr. Smith' tempt the reader to believe that Jane Austen has found a rival, or at least a very successful imitator. As the story advances, this impression fades away; though the reader is still entertained, he lowers his expectations. Miss Austen, in her best novels, is interesting to the last page; the tissue of her narrative is always close and firm, and though she is minute and analytical, she is never prolix or redundant. In being twice too long, 'Mr. Smith' only incurs the same reproach as nine-tenths of the clever novels of the day. The author has undertaken to report in full every sentence of every conversation that took place in a certain village and its neighborhood during a certain winter when Mr. Smith came to take up his abode there and put the marriageable young ladies into a flutter. Her pages contain an inordinate amount of talk; at least half of it might be spared. Half, however, is excellent for humor and observation; it is just the talk which would have taken place in those particular circumstances. The "sensational" novel has been greatly denounced, but the English fiction of our day has certainly gone very far in the portrayal of quiet life. 'Mr. Smith,' it seems to us, marks the uttermost limit, and in reading this volume we have wondered not a little at the skill which could throw such homely incidents into so entertaining a light. The skill is for the most part in the writer's humor—humor of a gentle, circumspect, feminine order, but, such as it is, very alert and abundant. Mr. Smith is a rich old bachelor who comes to make himself a home in a genteel village, and the story relates the matrimonial campaign of four or five more or less desperate spinsters. This is a familiar situation, but the author makes us smile at it afresh. Indeed, looking at things critically, we feel tempted to accuse her of making us smile too much. The state of mind of young girls like the Misses Tolleton and the Misses Hunt is half-pitiable and half-contemptible, and Miss Walford seems to us to have gone quite astray in attempting, toward the close of her tale, to inspire us with a sympathetic interest in a heroine whose baser nature she has so satirically exposed as that of Helen Tolleton. This young person baits her hook for Mr. Smith more artfully than her rivals, and fairly lands her prize. But just after being accepted, Mr. Smith, who remains throughout the book a rather impalpable shadow, dies abruptly of a mysterious malady, and this manœuvring maid is brought to confusion. Here, on all grounds, the story should have ended. But it has contained one other marriageable man, and he is promptly handed over to Miss Tolleton in compensation for her loss. This surely is rather vulgar morality—for morality it pretends to be. Be very mercenary, we infer, be cold and hypocritial and snobbish, and all things, at the end, will be well with you. 'Mr. Smith' will possibly be even more entertaining to American readers than to English, but the former will ask themselves a few independent questions. Is the matrimonial market in England really so "tight" as Miss Walford would have us believe, and is the business of procuring a husband carried on with such explicit frankness? Do well-conditioned young girls, like the Misses Tolleton, discuss their own private enterprises in this line with the

crudity—the brutality, we might almost say—observable in the conversations here recorded? If this is the case, 'Mr. Smith' is more than entertaining; it is really valuable. We should not forget to commend the portrait of Mrs. Hunt, the doctor's wife, and another of two unremunerative daughters whom Mr. Smith does not marry. She is drawn with a quite masterly acuteness, and we would retain all *her* conversation verbatim. We decidedly recommend the book as it stands, but the author will do still better if she makes a point of compression.

## Schools.

(*See also Term Announcements.*)

*A CLASS FOR YOUNG GENTLEMEN,* and private instruction. Circulars sent on application. THOS. R. ASH, 17 East Sixteenth Street, New York.

*ALLEN'S ACADEMY.—An English, Classi*cal, and Polytechnic School. IRA W. ALLEN, LL.D., President. 737 Michigan Avenue, Chicago.

*ADAMS ACADEMY, Quincy, Mass.—Hon.* Charles Francis Adams, LL.D., Chairman of the Board of Managers; William R. Dimmock, LL.D., Master. Designed to give the most thorough preparation for college. For catalogues, address the Master.

*AMERICAN CONSERVATORY OF* Music.—Musical Boarding-School, 144 Fifth Avenue, New York. For Prospectus and particulars, apply to Prof. SCHROEDER, Director.

*AMERICAN VOCAL INSTITUTE,* 103 Waverley Place, New York. The radical cure of Stammering and Stuttering by a system of instruction founded upon correct physiological principles a specialty. Send for circular.

*AT THE JAMESBURG (N. J.) INSTI*tute each boy has the special care he needs. Address M. OAKEY, A.M., Principal.

*BALTIMORE.—All Saints' School,* 261 *Ham*ilton Terrace. Rev. Jos. RICHEY, M.A., Rector. Address the Sister Superior.

*BELLEVUE HOSPITAL MEDICAL COL*lege. City of New York. Sessions of 1875-'76. For the Annual Circular and Catalogue, giving regulations for graduation and other information, address the Secretary of the College, Prof. AUSTIN FLINT, JR.

*BELOIT COLLEGE for Young Men. Address* Pres. A. L. CHAPIN, Beloit, Wis.

*BOARDING SCHOOL FOR BOYS, Throgg's* Neck, Westchester, N. Y. Boys prepared for College, Scientific Schools, or Business. B. T. HARRINGTON, Pr'cipal.

*BOARDING SCHOOL for Boys and Young* Men at Wilton, Conn. Home comforts. Healthy location. Terms moderate Address AUGUSTUS WHITLOCK.

*BORDENTOWN FEMALE COLLEGE,* N. J Graduating courses in Science, Classics, and Music, with degrees conferred. Rooms newly and nicely furnished. REV. WILLIAM C. BOWEN, A.M., Pres.

*BOSTON, MASS.—The Newbury Street School* for Young Ladies. For list of instructors and full information, address REV. HENRY C. BADGER.

*BOSTON UNIVERSITY.—W. F. Warren,* LL.D., President.—Co-operating Faculties at ATHENS and ROME:
School of All Sciences - Post-Graduate Department.
School of Theology—Dean, Rev. J. E. Latimer, S.T.D.
School of Law—Dean, Hon. Geo. S. Hillard, LL.D.
School of Medicine—Dean, I. Tisdale Talbot, M.D.
School of Oratory—Dean, Lewis B. Monroe, A.M.
College of Liberal Arts - Dean, Rev. J. W. Lindsay, S.T.D.
College of Music - Dean, E. Tourjee, Mus. Dr.
College of Agriculture—Dean, Wm. S. Clark, Ph.D., LL.D.
Preparatory Academy Princ., F. D. Blakeslee, A.M.
For information concerning any Department, address the appropriate DEAN, Boston, Mass. The University Year-Book (pp. 128) will be sent by the Registrar, Dr. D. Patten, on receipt of 25 cts.

*BOYS AND YOUNG MEN privately fitted* for College. Conditioned or rejected candidates coached. Stockbridge, Mass. F. HOFFMAN.

*BROOKEVILLE ACADEMY. A Home School* for Boys. Midway between Washington and Baltimore. Board and Tuition $250 per annum. Boys prepared for Naval Academy and West Point. Send for Catalogue or address the Principal, Prof. S. H. COLEMAN, Brookeville, Md.

*CARLETON COLLEGE, Northfield, Minn.* Open to both sexes. J. W. STRONG, D.D., President.

*CHEGARAY INSTITUTE for Young La*dies and Misses, 1527 and 1529 Spruce Street, Philadelphia, Penn. Madame D'HERVILLY, Principal.

*CHICAGO.—Union College of Law, of the two* Universities. V. B. DENSLOW, Secretary.

*COTTAGE SEMINARY, Pottstown, Pa. A* home school for girls, situated on Philadelphia and Reading Railroad, forty miles from Philadelphia. Thirty boarders. Twenty-sixth year. For catalogues, address GEO. G. BUTLER, A.M., Principal.

*COLUMBIAN UNIVERSITY, Washington,* D. C.—College, Law, and Medical Schools. J. C. WELLING, LL.D., President.

*COLLEGIATE AND PREPARATORY* School for Boys now open at Brier Cliff, Sing Sing, N. Y. Small, select, thorough, and cheap are its distinguishing features. A few vacancies, at $300 per annum. No extras. Age of admission, eight to fourteen years. French and German spoken in the School. A. H. AUSTIN, Principal.

*CORNWALL HEIGHTS SCHOOL, Corn*wall-on-the-Hudson, N. Y. Not military; grounds, twelve acres; limited to thirty resident members; four male teachers and three lecturers.

*CLASSICAL INSTITUTE, Waterville, Me.* A first-class institution. College preparatory course, three years; Ladies' collegiate course, four years, with degree; tuition, $6 per quarter; board, in club, $2 25, in families $3 to $4, per week. Send for catalogue to J. H. HANSON, LL.D., Principal.

*CLEVELAND SEMINARY. Boarding School* for Girls. For catalogue, address S. N. SANFORD, Pres., Cleveland, O.

*DABNEY UNIVERSITY SCHOOL.—V.* Dabney (late principal of Princeton College Preparatory School), 25 East Twenty-ninth Street, New York City.

*DENISON UNIVERSITY, Granville, Ohio.* Address Rev. ELISHA B. ANDREWS, President.

*DETROIT FEMALE SEMINARY (Incor*porated 1859.) Fall term commences Sept. 7. For BOARD OF INSTRUCTION and full information, address Mrs. TOWLE, Principal, Detroit, Mich.

*DREW THEOLOGICAL SEMINARY,* Madison, N. J. Address the President, JOHN F. HURST, D.D.

*DR. J. SACHS'S COLLEGIATE INSTI*tute, 101 West Forty-fifth Street. Pupils prepared for Harvard, Cornell, Columbia. German a special feature of the school.

*DR. MEIGS'S Family School for Boys, Potts*town, Pa. Classical, Scientific, and English Courses.

*DRURY COLLEGE and MISSOURI CON*servatory of Music at Springfield, Mo. Full Classical and Scientific Courses of Study. For both sexes. Musical advantages unsurpassed. Excellent climate for study. N. J. MORRISON, D.D., President. A. B. BROWN, A.M., Director Conservatory of Music.

*DUANE S. EVERSON'S Collegiate School,* Harvard Rooms, cor. 42d St. and 6th Ave., New York.

*EILDON SEMINARY—Seven miles from* Philadelphia, on the N. Penn. R.R.—A Home School for twenty-five young ladies. French and Music specialties. For circulars, address Miss CARE, Principal, Shoemakertown P. O., Mont'y Co., Pa.

*ELMIRA FEMALE COLLEGE, with su*perior advantages for Literary, Scientific, and Æsthetic culture. Rev. A. W. COWLES, D.D., Pres., Elmira, N. Y.

*FOR SIX SMALL BOYS, special culture,* explained in circular, by D. MACK, Belmont, Mass.

*FAMILY SCHOOL for Boys, Gt. Barrington,* Berkshire Co., Mass. JAMES BIRD, A.M., Princips..

*FAMILY SCHOOL, NEWPORT, R. I.* J. R. Leslie, A.M., Principal. Reopens September 14. Prepares for our best colleges or for business; French and German a specialty; thorough and systematic training. References: Thatcher Thayer, D.D; F. W. Tilton, Head Master Rogers High School, Newport; J. H. Raymond, LL.D., Prest. Vassar College; A. Roch, Prof. French, Vassar College.

*GARRET BIBLICAL INSTITUTE, Evans*ton, Ill. Address H. BANNISTER, D.D., Sen. Prof.

*GANNETT INSTITUTE, Boston, Mass.* (For Young Ladies.)—For catalogue, address Rev. GEO. GANNETT, Principal.

*GILMANTON ACADEMY, N. H.—A* limited number of boys taken by the year. Seminary Hall having been newly opened, a few vacancies still exist. Superior instruction; unsurpassed natural surroundings. Address W. A. DEERING, A.B.

*GODDARD SEMINARY, Barre, Vt.—Four* complete courses of study. Send for a catalogue.

*GREYLOCK INSTITUTE, South Williams*town, Berkshire Co., Mass. A first-class Preparatory School. Terms $450 per year. For catalogues address BENJ. F. MILLS, A.M., Principal.

*GROVE HALL, New Haven, Conn. Boarding* and Day School for Young Ladies. Established 1820. Miss MARIA P. MONTFORT, Principal.

*HAGERSTOWN SEMINARY for Young* Ladies, Hagerstown, Md. Rev. C. L. KEEDY, Principal

*HARVARD UNIVERSITY. Mr. Wm. W.* Newell's Preparatory School, limited to about ten pupils. 115 E. Twenty-sixth Street.

*HARVARD UNIVERSITY, Cambridge,* Mass. For information, address as follows:
HARVARD COLLEGE—J. W. Harris, Secretary.
DIVINITY SCHOOL—Prof O. Stearns, D.D.
LAW SCHOOL—J. H. Arnold, Librarian.
LAWRENCE SCIENTIFIC SCHOOL—J. W. Harris, Secretary.
MEDICAL SCHOOL—Dr. R. H. Fitz, Boston.
DENTAL SCHOOL—Dr. T. H. Chandler, Boston.
BUSSEY INSTITUTION, a School of Agriculture and Horticulture—Prof. F. H. Storer, Jamaica Plain.
SUMMER COURSES IN SCIENCE—J. W. Harris, Secretary.
EXAMINATIONS FOR WOMEN—Prof. C. F. Dunbar.

*HIGHLAND MILITARY ACADEMY,* Worcester, Mass. C. B. METCALF, A.M., Supt.

*HOME SCHOOL FOR BOYS, West Boxford,* Mass. Terms moderate. Address Rev. C. E. PARK.

*HOME SCHOOL for Six Boys.—Home and* School.—School with home. Address Rev. C. T. CANFIELD, So. Boston, Mass.

*HUNGERFORD Collegiate Institute, Adams,* N. Y. Classical and scientific courses; healthful; accessible; expenses moderate. ALBERT B. WATKINS, Ph.D.

*IVY HALL, Bridgeton, N. J., thirty-eight* miles from Philadelphia. Family School and Christian Home for Young Ladies. Miss M. SHEPPARD and Miss C. E. HILL, Principals.

*JOHN MACMULLEN'S SCHOOL,* 1214 Broadway. Carpentry, Latin Conversation, etc.

*LASELL SEMINARY for Young Women* Auburndale (near Boston). Delightful Home. Superior advantages. Terms reasonable. Address CHARLES C. BRAGDON, Principal

*LAW DEPARTMENT OF IOWA STATE* University. Course of one or two years at option. Tuition $50 per year. Address WM. G. HAMMOND, Iowa City.

*LINDEN HALL, a Moravian Seminary for* Young Ladies (founded 1794), at Lititz, Lancaster Co., Pa. Rev. H. BRICKENSTEIN, Principal.

*LOCKWOOD'S ACADEMY, Oxford Street,* Brooklyn, with Kindergarten and Calisthenium. Sexes separate in collegiate grades. For English studies, $5 to $25.

*MADISON UNIVERSITY. E. Dodge,* LL.D., President. Colgate Academy. F. W. Towle, A.M., Principal. Hamilton, N. Y.

# The Nation.

*NEW YORK, THURSDAY, SEPTEMBER 30, 1875.*

## The Week.

ON Wednesday week the Massachusetts Democrats held their State Convention, and, as was expected, renominated Mr. Gaston for Governor. They joined to him, as Lieutenant-Governor, Gen. Wm. F. Bartlett, an independent in politics, who may or may not, it is said, consent to part company with the Republicans. Up to this time, however, he has not declined the nomination, and he has thrown his weight, which is considerable, in favor of the strongest possible nominations on the part of the Republicans. Not only is his character as good as Gov. Gaston's, but his personality is much more vigorous and pronounced, and he has many elements of popularity. He represents, too, the western part of the State, the section which is just now causing the regular party leaders among the Republicans the greatest anxiety. The platform consisted of twelve planks, two of which were given to burying the issues of the civil war; two to arraigning the Republican party for divers shortcomings; three to praise of Gov. Gaston and Gen. Bartlett. The third resolution opposes "any further issue by the Government of a currency inconvertible with gold—the world's recognized measure of values," and urges a speedy return to specie payments. The sixth is an *ad-captandum* generality on capital and labor; the seventh congratulates the people on the repeal of the prohibitory law; the eighth we do not profess to understand, but it denounces, as anti-Democratic, "constitutional amendments which limit or restrict the election of public officers by the people"—including, we suppose, the judiciary; the ninth takes an "honest pride" in the progress of "reconciliation, peace, and fraternity" as shown by the late Bunker-Hill commemoration. The hard-money plank elicited a single opposing speech and opposing vote.

Buncombe and hard money excluded, this platform announces very little concerning the Democratic party in Massachusetts except that it regards itself as better than the Republican, which it can only accuse of extravagant increase of the public debt of the State, its other sins being transferred to it from the party at large. In other words, the challenge is not as to policy but as to men, and that the Republicans feel this keenly has been very evident during the week. In ordinary times, Mr. Rice would be a "good enough Morgan" to beat both Loring and the Democratic candidate; but it is, first, extremely doubtful whether he can dislodge Gov. Gaston as an incumbent, who has given general satisfaction; and in the next place, he cannot expect that the name associated with his as candidate for Lieutenant-Governor will have anything like the prestige that attaches to Gen. Bartlett's. The one thing clear is that Dr. Loring, if he gets the nomination, will lose the election for the party. That under these circumstances the nomination of Charles Francis Adams has seemed more and more of a necessity and a possibility, instead of a piece of harmless enthusiasm on the part of the Springfield *Republican*, is not surprising. The Worcester *Spy* and other papers in the middle and western portion of the State have come out for him, a certain number of delegates have been instructed to vote for him, and many of the unpledged are confidently counted on as his supporters. Mr. George Wm. Curtis, too, in a creditable private letter, as unlike as possible Mr. Henry Wilson's ambiguous letter of advice, has warmly counselled the nomination of Mr. Adams, on party as well as on public grounds, and doubtless with some effect, as the letter speedily got into print. As we go to press the convention is doing its work, and the news of the result will outstrip any speculation of ours upon it. The indifference, timidity, or open hostility of the Boston papers and politicians does not encourage us to hope that Massachusetts will honor herself with such a Governor as Mr. Adams would be. Gen. Butler has been elected as one of the delegates, but it is said he will absent himself, although his partisans are commonly supposed to be those of Dr. Loring.

Judge Pershing, the Democratic candidate for the Governorship in Pennsylvania, has written a very adroit letter of acceptance. He gets over his unfortunate career as a Copperhead during the war by pronouncing all the issues with the South settled, and then gives his whole mind to the consideration of the currency. He says "he is opposed to inflation in its true sense, and inflation is not demanded by the Erie platform." It simply opposes contraction, which he thinks would produce untold misery. We must wait until we stop exporting gold to pay interest on our indebtedness abroad, before specie payments can be safely resumed, but when that period will be he prudently refrains from mentioning. He is in favor of such a volume of the currency as "the legitimate demands of business" may require; but here again he 'cutely forbears to mention what amount this is, or whether anybody knows or can know anything about it, but does not hesitate to hand the duty of determining it over to Congress. The close of his letter is curious, as illustrating the distinction which we have lately several times maintained exists, and has existed from the beginning, in the Democratic mind between bank paper and Government paper. "I will only add," he says, "that I adhere to the doctrine always held by the Democratic party, that gold and silver constitute the true basis *for a bank-note circulation*. The question as to this is not the same with that as to a paper currency that is of itself made by the sovereign power a legal tender, and *therefore money*." This is about as clear as mud; but what does the *World* say to it? We would advise Judge Pershing to ask himself, as a mental exercise, what the effect on bank circulation would be of a declaration by "the sovereign power" that it too was a legal tender. Would this make it "money"? If not, why not? If so, why does a bank circulation need to be based on gold and silver? Why not pass an act to save banks the trouble of keeping coin and make their bills a legal tender in payment of debts, and thus have the delightful abundance of "the circulating medium" described by Nasby at the Confedrit Cross-Roads?

The leading men of the Pennsylvania Industrial League, Messrs. Joseph Wharton, Henry C. Lea, and William Sellers, who have in times past acted with and supported Mr. William D. Kelley on fiscal questions, have found it necessary to issue a circular addressed to their old friends and associates disclaiming all connection with that gentleman in his present currency schemes, which they pronounce "revolutionary," and "intrinsically and in the highest degree unsound," and "devoid of that hold on common sense without which no financial structure has ever long endured, no matter by what ingenuity introduced, or by what authority enforced." We would submit, however, to these gentlemen whether it has not occurred to them that the prolonged heat, not to say fanaticism, with which all parties in Pennsylvania, including the Industrial League, have enforced the doctrine that the Government is bound not only to help to found and encourage branches of industry, but to come to their relief by changes in taxation whenever they are from any cause depressed and need higher prices, is not producing its natural fruits, in debauching the public mind in that State on the whole question of the relations of the people to the Government? In our view, that effect of the protective system on which free-traders dwell most—the taxation of one portion of the community for the benefit of another—is small and insignificant compared to the effect the system produces in confusing the minds of plain people as to the things which they ought to do for themselves, and those which the community at

large ought to do for them; and in a country governed by universal suffrage this effect is dangerous in the highest degree.

---

Mr. Schurz has made his opening speech to an immense meeting at Cincinnati, and it is safe to say that, as a happy and effective piece of popular oratory, in the best sense of that term, it was as good as anything he has ever uttered. He took occasion in opening to repudiate the assumption that he was working back into the Republican party, or that he was doing any other work in Ohio than he had done in the Senate when he withstood the inflationists of both parties in that body last winter. Some of his *reductiones ad absurdum*, performed on the venerable Allen's speeches, were very happy specimens of that argument. Allen meets the difficulty about the great accumulation of money in the banks just now by the assertion that money in bank is of no more use to the community than "corn-stalks," and Senator Schurz had actually to point out to an acute commercial community that the talk of the old war-horse was nonsense, because, as it is the custom of the American people to deposit their money in banks as soon as they get it, if money in bank is of no use to trade, the issue of greenbacks to "bring the volume of the currency up to the wants of trade" would have to be limitless and unending. It is of course useless and more or less dangerous to prophesy about a contest which at best will be close, but from all we hear there is good reason for believing that it will end in a decisive victory for the friends of a sound currency. In fact, considering the character of Allen's opinions and speeches, his election would justify very gloomy views about things far more important than the vote of any one State on any one question.

---

We had an inflation meeting in this city on Thursday last which had been long heralded, but somehow was by no means a success. Butler and Wendell Phillips were not among the speakers, though they had been promised; but the latter wrote a letter insinuating that some public men were crazy, though he judiciously refrained from enumerating them. The audience was small, and hostile to the objects of the meeting, and the speeches were sad affairs. The resolutions repeated the old and well-known wish that "the volume of the currency should be made and kept equal to the wants of trade"; demanded the withdrawal of all national-bank notes and the substitution of greenbacks, and that the latter should be received in payment of all public dues, including at least one-half the customs duties, forgetting, we hope, that this would be cheating; and, finally, the establishment of free State banks of discount and deposit. Such of the speakers as touched on the currency—for some spoke of nearly everything else—treated it metaphysically, that is, not as one of the tangible facts of life, but as a figment of their own imaginations, to be shaped as they pleased. Nobody would suppose from their talk that the human will and human liberty of choice had anything to do with the value of different kinds of currency.

---

Secretary Delano has at last resigned, in a long letter, in which he reminds the President that he wished to resign last fall, when the President asked him to remain; that he repeated his wish last spring with the same result; and the reasons for this decision were the importance, intricacy, and difficulties of the duties of his office, which he enumerates, and his own skill and fidelity in the discharge of them, and his necessary exposure to falsehood and misrepresentation on account of them. He adds that during all this time he has had the entire confidence and sympathy and co-operation of the President, while he on his part has for the President the "highest regard, founded upon unqualified confidence in his unselfish patriotism, the accuracy and solidity of his judgment, and on the high sense of justice which has always characterized him." The general impression, in fact, conveyed by the letter is that one man of extraordinary talents and virtue has been employed by another to execute a task of extreme difficulty, which he has performed to the complete satisfaction of both. In reply, the President sends the usual testimonial which he gives them all when they go out of office. He says he has received his letter of resignation of July 5 in due course, but held it on account of the "continued persecution which was being unjustly heaped on Mr. Delano by the public press." He accepts it now in order to give his successor time to prepare for the meeting of Congress. He confirms Mr. Delano's story about his desire to retire a year ago, and his own unwillingness to let him do so, and trusts that "the future will set him right with the public," and that he will enjoy its confidence as heretofore, and assures him of his continued respect and friendship. As the President bore testimony of a similar character to the virtues of "Boss" Shepherd, by promptly renominating him for the office out of which he had been legislated for corruption, he can hardly take it amiss if we assume that his testimonials are not now worth anything to anybody, and that he might as well have let Mr. Delano go in silence.

---

Mr. Delano, with an affectation of modesty which is highly becoming, would fain hope that the results of his administration of the Internal Revenue Office are not entirely unknown to his fellow-citizens. He presided over that office for a year and eight months, but, according to our recollection, he gave it very little of his personal attention, and left it in a condition which betokened anything but intelligent, consistent management or executive efficiency. The year following he had so far forgotten the cost of collecting the revenue that, in a stump-speech in Ohio, he made out a difference of nearly two millions and a half between the last year of Johnson's and the first of Grant's Administration, whereas the decrease had been only about $160,000. This was a pretty serious error for a chief officer to make who desired to be remembered by his fellow-citizens, and it was heightened by a disingenuous omission to state that the taxes under Johnson were much more numerous and complicated than they were subsequently, and required a larger force to collect them; and that the ratio of cost of collection to net receipts was, if anything, higher in 1869–70 than in some of the years immediately preceding. In short, if there is anything we shall have to remember about Mr. Delano, it is that he succeeded an honest and capable Secretary of the Interior, who resigned because he would not allow politicians to meddle with the affairs of the Department, and that he in turn resigned long after it was evident that he was not capable, and at a time when his going, unlike Secretary Cox's, added strength to the Administration by removing a burden.

---

Mr. Henry Clews, our late Government banker, as Clews, Habicht & Co. in London, applied last week for his discharge in bankruptcy, but it was opposed on the ground of fraud by many creditors, and the hearing was postponed until September 30. The alleged frauds are very numerous, but mostly arise out of the dealings of the firm in carpet-bag bonds of the Southern States, and out of the transfer of assets left on Mr. Clews's hands when he first failed in 1873 to a new firm which he subsequently formed, and which soon failed also. Among the claims filed against him last Thursday, on which another charge of fraud is based, is one of two persons named Cheever and Van Buren, who produce a contract made with them by him in July, 1869, by which he agreed, in case he was appointed "the financial agent of the Government in London, Paris, and Frankfort, to divide the profits of the same with B. H. Cheever and James Van Buren, one quarter each, they being partners in such proportion." They now allege that he made $600,000 by his agency, and has not fairly divided with them. It thus appears that Clews was working for the agency two years before he got it; and what the public would now like to know, and what, we trust, the next Congress will take pains to find out, is, who B. H. Cheever and James Van Buren are, and *why* Clews agreed to give them half his profits in case he was put in a Government place of high financial trust and responsibility.

The existence of this contract came to our knowledge in the spring of last year. We always suspected that the existence of something of the kind was necessary to account for Clews's appointment. Mr. Boutwell, who made it, gave for it a reason which was on its face absurd, that the Treasury wished to put the business in American hands (Clews was an Englishman and his partner Habicht a Swede), and that the Barings had unduly pressed the State Department for a small balance during the war, which was untrue. We have never had the slightest doubt that this extraordinary change had a job of some kind, and probably a disgraceful one, concealed in it, and we believed that Mr. Boutwell was responsible for it, as he was in part for the Sanborn scandal. We hope that the next House will therefore thoroughly investigate him on this point, and that his health will not break down under it at the critical moment, as it did in the Simmons trouble. He is one of a class of politicians who just now will repay the close and undivided attention of all patriotic men, we mean the class which unites great skill in the low arts of politics—those of chicane and intrigue—with an exterior of austere republican virtue and simplicity.

---

The Cheever and Van Buren claim is likely to have one curious result. On inspecting the contract, in which these two are described as partners for one-half the profits of the Government financial agency, which amounted as they say to $600,000, the Trustees in Bankruptcy decided that the partners were liable for their share of the amounts, and they have accordingly begun proceedings against them. The point raised, it will be seen, resembles somewhat in morals though not in law that made against Mr. Henry C. Bowen, of the *Independent*, on the contract to push the sale of the Northern Pacific bonds by the use of his money and editorial columns, by Mr. E. R. Robinson, the counsel for the trustee of Jay Cooke's estate. By the bye, why does Mr. Robinson not push on that suit? Is Mr. Bowen to be allowed to go on saying his prayers daily with that mass of ill-gotten stock and bonds on his shoulders? Does the Trustee not owe it to Mr. Bowen's soul to try to the utmost to relieve him of it?

---

The autumn trade has made good progress during the week, and in some departments there has been a degree of activity not witnessed for several seasons. The rule, however, with buyers continues to be to take small lots, make quick sales, and replenish stock frequently. Under favorable circumstances, such as seasonable weather, country traders can buy goods for "cash," and turn them into money, and make their payments to city jobbers, within the time which the term "cash" covers. In business like this no paper is made, and the extent to which it is carried on is an explanation of the small stock of mercantile paper in the market. The favorable side of this kind of business is its entire safety to all concerned; the unfavorable side is that it betokens lack of confidence in the future. The crops of the country meet the highest expectations; the lowest estimate for cotton is 4,250,000 bales, and from this it runs up to 4,650,000 bales. With such a crop, even at a low price, the South particularly and the country generally cannot fail to be largely benefited. Other Southern crops, like sugar and rice, are also exceptionally good. In the West, wheat will be above the average, and the corn crop will be the largest ever produced. A low price for cotton is inevitable, both because of the immense crop and the depressed condition of manufacturing interests here and in England. During the week there has been a decline in breadstuffs, the foreign markets having for the time been overstocked by the heavy shipments there in July and August, when it was thought the European harvests had failed; the continued disorder of the foreign-exchange market has also worked against the breadstuff markets. Notwithstanding all this, however, it is known that Europe wants and must have a larger amount of grain from us than during the past two years, and later in the season the movement is expected to reach large proportions, provided the foreign-exchange market can be kept free and clear. Gold has ruled at 116¼ to 116⅜, and the holders of it have the same control, but in respect to gold loans have exercised more forbearance, and with the result of a less fitful foreign-exchange market. There has been less coin imported than was expected, and not enough to give relief. It is still the settled opinion of bankers that a large amount of gold will have to be imported to move the crops. At noon on Saturday the value of $100 currency was $85 74.

---

There has been a strike among the operatives at Fall River, as everybody knows, for many weeks, to which the manufacturers were not at all averse, as it gave them a good excuse for lying idle during the dull times. Many or most of the mills resumed work on Monday, exacting, however, from all workers presenting themselves for employment a written pledge not to belong to the unions by which the strikes are begun or controlled. This caused the recalcitrants outside to form a mob, and attack those who had surrendered, on their way to or from their work, and there was finally a riot on a small scale, which caused the mayor to call out the militia. The fact is that the directors of strikes have so little judgment or discretion, and strikes are now becoming so common, that it is difficult for manufacturers to form any reliable calculation in the conduct of their business, and the exaction of some guarantee of steadiness and persistence from workers seems absolutely necessary if capital is to find any safe field in certain kinds of production calling for expensive buildings and machinery. What will be the end of the struggle, as at present conducted, it would be hard to say.

---

The news from Europe is mainly made up of rumors and counter-rumors from Herzegovina. As a general rule, the reports of insurgent successes have turned out false, while those of Turkish successes have been confirmed, a circumstance which prepares one for the despatch to the London *Standard* that "a bureau has been established at Belgrade for furnishing false and warlike news," which is not unlikely. The Servians have worked themselves up to fever heat, and have been mobilizing their troops, buying horses, and making other bellicose preparations, but the restraining hand of Austria will doubtless prevent any outbreak of hostilities, though there is always danger from chance collisions on the frontier. It is almost impossible for a Turkish patrol or sentinel to look long at an unarmed Servian without taking a shot at him, and the converse is equally true. The mediating consuls have got back to Mostar, the capital of Herzegovina, after a wild-goose chase after the insurgent headquarters, which are literally "in the saddle," and without having accomplished anything in the way of negotiation. The rebels are scattered and worn out, and the country is at the mercy of the Turks and greatly desolated, one of the deplorable accompaniments of Turkish fighting being the presence of large bodies of irregulars from Anatolia and Albania, who eat up everything, or burn and destroy what they leave. A joint appeal of the Christian powers to the Porte to make concessions and restore peace is the last thing talked of.

---

From Spain the news comes that the late Minister Castillo was not so stiff in his hostility to the priesthood as had been supposed; that the Pope has his promise that the new Government would try to observe the concordats, and that, therefore, the late circular of the Nuncio to the bishops was not as unjustifiable as it seemed. Moreover, the rumor that the Nuncio had been recalled is contradicted, and, in fact, it looks as if the Alfonsists were again bidding against the Carlists for the support of the priests. The stories about the military operations are as conflicting as ever, but it seems as if the Government forces were really gaining ground. The longer Alfonso manages to stay on the throne, the better his chances are, and the order for an election of the Cortes in December looks as if he thought himself strong enough to set up a regular Government. A good deal will depend on its composition when it meets.

## THE PARTY AND THE PRESS.

ONE of the most gratifying features in the present crisis is the readiness of the two parties to offer good nominations to the electors. Both in this State and in Massachusetts, for instance, the voters have the prospect of an alternative which, for general excellence, has not been presented to them for a long while. This is, in fact, due to the exhaustion of the platform as a means of influencing opinion. During the ten years which have elapsed since the war, both parties have mainly relied on their platform, which was so drawn as to have as much sound and cover as much space as possible. One of its essential features, and not the least amusing for a long time, was the insertion of a clause intended, by some vague, meaningless phrases, to flatter or soothe or reassure all classes and interests, however much opposed to each other. The party, for instance, regularly once a year undertook, with unblushing front, to solve all those problems of society which lie in the reconciliation of conflicting claims, or, in other words, all the really serious problems of politics. It would offer to pass laws which would satisfy the laborer and capitalist, the borrower and the lender, the poor and the rich, the carrier and the passenger, the bailer and bailee, mortgagor and mortgagee, the producer and consumer, the farmer and manufacturer, and so on through the list of social and legal relations; and then, at the close, there was apt to be a highly entertaining plank, based on the assumption that some evil-disposed persons were engaged in trying to prevent the payment of the pensions of the soldiers and sailors, and conveying the assurance that the convention had its eye on them, and would foil their nefarious game. Of course, to do even half the work which the party thus cut out for itself, supposing it to be the party in power, there would have to be a large and carefully arranged collection of statistics in the hands of the Government; a body, larger or smaller, of leaders of legislation capable of drawing conclusions from them; a majority in Congress willing to be guided by the best opinion of the civilized world on the knotty points of political economy and jurisprudence; and a public sentiment, either thoroughly enlightened on the more recondite questions of the day, or else prepared to support somebody who was. But to such a combination of circumstances nobody concerned in drawing platforms ever looked. Indeed, any mention of such a thing as a necessary accompaniment or consequence of the platform would have excited great laughter in the committee-room, and a dozen representatives of the Ungrammatical Plain Man would have jumped up to say that they thought that the country could be saved without all this fuss. The general result was apt to be, that, to a declaration of principles worthy of a council of Comtist sages, there was appended a list of candidates whose views on the prominent topics of the day were as simple and artless as those of the Congressman who, finding the currency forcing itself on his attention, determined to "read up" on it, and demanded of the Washington bookseller 'John Smith on the Wealth of the People,' but, learning that this was not to be had, admitted that 'Barnum's Art of Making Money' would do just as well.

This plan of making a high-sounding platform do all the work of the canvass, and, in fact, serve in place of legislation—of which a good illustration is to be found in the Republican action with regard to the civil-service reform after the declarations of the Philadelphia Convention—was pursued with tolerable success until 1872, when the Cincinnati movement and the interest which it at first excited showed that it did not work well. Then came the theory that the Republican party in power was a kind of church, which had to be reformed from the inside, for which there could be no substitute, and the leaders of which derived from the possession of "orders," if we may use the expression, a constant right to lead in spite of occasional aberrations. This lasted two years, or until last fall, when the party, after drawing up platforms of more than usual power and volume, nominated exactly the same old hacks for office as before, and found to its astonishment that the public was not only tired of platforms but had lost confidence in "reform within the party," and was disposed to seek reform anywhere. The result is that this year we have increased care on both sides in the selection of candidates, and increased modesty and simplicity in the construction of platforms, and a total silence about the pensions of the soldiers and sailors. Neither party offers to solve all the great social problems, and regenerate the commonwealth within the twelvemonth next ensuing. The most that either promises to do is to restore specie payments, and secure common honesty in the management of the public funds, or else to ward off the horrible calamity of a contraction of the currency. It is true that Kelley promises the joys of Eden through his 3-65 bond, but then he has not succeeded in inducing either Republicans or Democrats formally to adopt his schemes.

Of course all this is full of suggestions. There is one, however, that presents itself with peculiar prominence, and that is the enquiry why the better, semi-independent class of Republican newspapers—of which *Harper's Weekly* may be taken as a good type—which have to a certain extent assumed the relation of a loving observer and critic towards it instead of the old one of organ—why this class delays its criticisms and its warnings until things reach the sad pass in which we now see them in this State, for instance. Why not speak out more boldly when the first signs of deterioration in an Administration present themselves? The first sign that General Grant had abandoned the strait and narrow way on which we all supposed that he had entered when he took office, was the appointment of Tom Murphy as Collector of this port. Why should honest and upright Republican papers have then gone on pretending that Tom was a good person and an unobjectionable person for the place? Why again remain silent when Casey began his performances at New Orleans, or pretend that, even if his conduct was a little irregular, he was a good man, beset by evil-doers and sternly battling for the right? Why look on so long without protest when Attorney-General Williams was treating the State constitutions at the South as if they were so much waste-paper? Why say nothing when Boutwell began to treat the Treasury as if it were his private business, for which his own views of expediency furnished the law? We might multiply these questions almost indefinitely. They would be answered of course differently by different journals—by the *Times*, for instance, in one way, and by *Harper's Weekly* in another; but all answers would lead us to the same conclusion—viz., that all discussion of public questions by the press, in order to be profitable, or, in fact, in order not to be mischievous, has to take it for granted and for firmly established that the influence of power is corrupting, and has always been corrupting, except in the case of very rare natures and under very peculiar circumstances. Therefore, when men in power begin to show signs of consulting their own wills, or convenience, or passions, rather more than the public welfare, it is chimerical to suppose that they will, if left to themselves or patted on the back, retrace their steps and mend their ways. They never, or hardly ever, do so. The love of doing what they please grows with the doing of it, and after its gratification has lasted a certain length of time they become incapable of taking advice, and treat criticism as insolence. This is true of parties as well as of individuals, of presidents as well as of kings. The time to check them on their downward course is at the moment of beginning it. It follows from this that "reform within the party" is an idle dream. No party has ever yet reformed itself. Party diseases are always fatal. The present state of things illustrates very well, too, the futility of the idea that by keeping silent about its failings, or condoning them, the Republican party could be kept in power and the Democratic party out. The support of the Administration by the honest press, so far from saving it, has simply helped to debauch the public taste and blunt its moral sensibilities; the Democrats have come in, or are coming in, all the same.

## POPULAR PROTECTION AGAINST FINANCIAL QUACKERY.

AFTER the experience through which the country is now passing, it is to be hoped that something will be done to make at least that portion of political economy which relates to the nature and

use of money a more prominent subject of instruction in common schools. The subject is taught in the colleges, but then very few people go to college, and it is high time that at least elementary notions of sound finance were imbedded in the mind of everybody before engaging in the active work of life. Political economy, it is true, is full of points on which stable or generally accepted conclusions have not been reached; but then there are some principles as firmly established as any truths of physical science, and which it ought to be popularly regarded as a mark of childish folly to doubt; and the futility of irredeemable paper is one of them. It ought to be as disgraceful and ridiculous in our day and generation for a grown man to go about like Kelley, or Allen, or Carey, trying to persuade people that good money could be manufactured by a printing-press, as to go about trying to persuade them that the sun goes around the earth. In short, the impossibility of dispensing with gold and silver as a measure of value ought to be by this time settled as one of the fundamental and indisputable facts of life, which are only questioned in lunatic asylums.

We do not believe the popular ignorance on the subject is nearly as great as the inflationists imagine. There is a strong element of farce in their agitation, which makes the wags enjoy their speeches, as containing the materials of a huge joke; and then the entirely penniless people, who have nothing to lose by change, are of course easily led by any scheme which promises to increase their "purchasing power" in however slight a degree; but there are not many Americans engaged in the purchase or sale of commodities, and *out of debt*, who are really deceived by the inflationist gospel. Such apparent popular success as it has achieved is largely due to the fact that the panic of 1873 was most destructive among the great enterprises. It found large numbers of persons laden with investments on a large scale, which required a long period of prosperity to enable them to turn out well. The consequence is that there is a powerful body of men among us, with great capacity for making a noise, who would like consumption to receive a stimulus, however brief, that would enable them to get rid of their stock of goods; or would like the value of paper money sufficiently lowered to enable them to pay a very large debt with a small sum in coin or other commodity. These people have a direct, personal, and strong motive for agitation which is wanting to the friends of resumption.

It has also to be taken into account that the West has received from the greenbacks its first experience of good money of any kind. They are, it is true, irredeemable, but then, unlike the old bank-bills of that region, they are current everywhere, and a man does not find his funds dwindle in his pocket as he rides away from home, and is delivered from all fear of broken banks and most of his fear of counterfeits. We at the East in these latter years can, in fact, hardly understand the amount of loss and inconvenience which has been infused into Western life in times past by the attempt of new communities to get along without hard money. These attempts have generally consisted in the establishment of banks of all sizes, exempt from proper legislative control, and often started by swindling adventurers, prepared to wind up the concern before their first issue of bills could get back on them. The memory of this state of things, which really lasted down to the war, is very bitter at the West, and makes the cry of "free banking," which is so popular with us, anything but popular with people out there. In point of fact, with gold, or with bills redeemable in gold, they have never been familiar. The kind of redeemable paper of which they have had most experience is paper which everybody forbore presenting for redemption lest he should break the bank, but passed on to his neighbor as fast as he could, not knowing the day when it might cease to be current, and which had a different value in every town he entered, and in some no value at all. The charm of the greenback to him, besides of course its poetic value as being "battle-born and blood-stained," lies in its being universally acceptable, and possessing uniform purchasing power in any part of the country. It is, doubtless, of different values on different days; but the value, whatever it may be, is the same everywhere; and it does not cease to be current in the course of a short buggy ride, as used to e said of some of the Western bank-notes. This is a point which the orators now wrestling with the Ohio inflationists ought to, and doubtless do, bear in mind, and which they can readily deal with, by showing that the National bank-bills, if their redemption in gold were guaranteed by the Government as their redemption in greenbacks is now guaranteed, would really possess all the qualities which now makes the greenback dear to the West—that is, they would circulate all over the country and would possess uniform purchasing power. A return to specie payments does not therefore promise a return to "wildcat banking" or to make a "bank-note detector" once more a necessary part of every trader's business equipment.

Now, however, that the Government has committed the great error of issuing irredeemable paper, and of making it a legal tender, nothing will ever prevent a revival of the demand for fresh issues of paper in times of difficulty, by a larger or smaller body of persons, except a better popular acquaintance with financial history. If there was a chance, even small, of making money by maintaining that the sun went round the earth, great orators and writers would be sure to present themselves in hard times, and maintain that this was really the case, and that the astronomers who held to the Copernican theory were horse-leeches who were fattening on popular simplicity and credulity; and they would have a certain measure of success, if it were not that the truth of science at least has worked its way, in spite of appearances to the contrary, into the list of popular fundamental assumptions. The reason why quacks are so bold and unblushing in finance is that all we know about finance is an inference from the recorded experience of other countries and other generations. No examination of paper-money or of gold by itself, as we see it in use to-day, would throw any light on their necessary relations as currency. When we want to understand this, we have to read the history of a variety of experiments, made in various places and at various times, which is just what the quacks refuse to do, and they flourish because their audiences have not done it either. We believe that there has not been a single expedient proposed in this country within the last ten years to enable us to dispense with redemption in specie, which has not been tried and has not failed in some American colony or State; nay, there is hardly one which was not tried in the State of Texas during its brief existence as an independent republic. The constant revival of them, therefore, in pamphlets, of which nearly every editor receives half-a-dozen every week, and in speeches and bills and resolutions, and the complacency with which hard-money men have to sit down to refute them as if they were new, startling suggestions, are almost discreditable to our civilization. One of the marks of civilization is familiarity with the experience of the race in its various fields of activity. Civilized men are not expected to have to discover everything afresh in each generation, and one of the uses of schools is to enable each generation to profit by this experience. The amount of attention Kelley, and Phillips, and Allen, and Carey, and their kind receive furnishes, therefore, a serious reflection on our system of popular education. Wendell Phillips, not long ago, arose unblushingly in the Social Science Association to debate finance and advocate paper-money, and showed in five minutes that he had so little aquaintance with the subject that he did not understand the English Bank-Charter Act of 1844, and did not know what happened when the Act was "suspended" in a panic by the action of the Ministry; and yet he still perambulates the country and delivers himself on this same subject, without the slightest increase of diffidence, and one occasionally sees refutations of him two columns long from old financiers in the Boston papers. He is enabled to do this solely owing to the largeness of the number of people among us who suppose that everything in finance is mysterious, that *all* its points are still open to discussion, and that we here, in the matter of our greenbacks, are treading new ground on which even intuitionists like Phillips may by some lucky stroke throw fresh light. And yet such financiers as he, if popular education on such matters were what it ought to be, would be as easily found out as any Eighth-Avenue astrologer.

## SCOTLAND.—THE ARGYLESHIRE GATHERING.

SEPT. 11, 1875.

I HAVE just been re-reading, in the land of its birth, the most delightful of English pastorals, Arthur Clough's long-vacation poem, "The Bothie of Tober-na-Vuolich." Clough, during his too short life, was so well known and so highly estimated on your side of the Atlantic that I need not ask you if you or your readers know the poem. The proverb that a prophet is not honored in his own country was never better illustrated than in Clough's case. For years after the publication of "The Bothie" in a limp paper cover, like an Oxford prize poem, very few people in England except Clough's old college friends had read the poem, or even heard of it. Clough was known by a few as a hard-working official in the office of the Committee of Council on Education, and as secretary, for the love of her and of her work, to Miss Florence Nightingale. No one except his most familiar friends recognized in "the grave man nicknamed Adam" one of the most genuinely poetic natures of his time. It was only after his early death, and when his poems were collected together, that the English world knew his worth. In America, I have been given to understand, he was appreciated much earlier. His sterling character, his energy of intellect, and his whole tone of thought were acceptable to a people who were sensitive to such qualities. Be that as it may, I feel certain that none of your countrymen or countrywomen who care for the sort of life that this poem treats of could object to be once more reminded of it. Every time I read the pastoral I seem to appreciate more thoroughly the fresh sense of healthy manliness, the subtle humor, the love of wild wandering among the stern grandeur and the softer beauty of Highland scenery, and the genuine spirit of the Oxford undergraduate life, which the author has embodied in his poem. Perhaps one ought to have known the pleasures of a long-vacation reading party, and to have lived by "the moorland of Rannoch," or in that lone land in the westward, where

> "—— the great peaks look abroad over Skye to the westernmost islands,
> . . . . . .
> Knoydart, Moydart, Morrer, Ardgower, and Ardnamurchan"—

to appreciate to the full the beauties of the pastoral, the music of the grand old Gaelic names, and the fresh, breezy life of the heathery Highlands. But even a brief sojourn in the Western Highlands during the golden September weather which we have been enjoying of late enables one to gather something of the spirit which pervades every line of the poem. Except, perhaps, the western shores of Greece, there is no part of any country on this side of the Atlantic which can bear comparison with the Western Highlands of Scotland for beauty of scenery and variety of effects. The very climate which, in ordinary years, but not in this year, is the wettest in the United Kingdom, helps the scenery, and by bringing out the intensity of color in the landscape heightens the effects; and none of these beauties escaped Clough's eye. If it be true that Sir Walter Scott made the Highlands, it is no less true that Clough gave a finishing touch to no inconsiderable portion of them. His poem is a treasure-house of perfect descriptions of Highland scenery. Take, for instance, the following eight lines, where the whole glories of the autumn tints (coming on, alas, too rapidly this year for those whose holiday is drawing to a close, and who must soon find themselves in the sloppy streets of London) are brushed in with such delicacy of touch and feeling:

> "It was on Saturday eve, in the gorgeous bright October,
> Then when brackens are changed, and heather blooms are faded,
> And amid russet of heather and fern green trees are bonnie;
> Alders are green and oaks; the rowan scarlet and yellow;
> One great glory of broad gold pieces appears the aspen,
> And the jewels of gold that were hung in the hair of the birch-tree,
> Pendulous, here and there, her coronet, necklace, and ear-rings,
> Cover her now, o'er and o'er; she is weary and scatters them from her."

But it is not my intention to write you a treatise upon Scotch scenery, or even upon Clough's poem. I was led to re-read "The Bothie" by the fact that I have just returned from assisting at an entertainment almost identical with that which Clough describes in his opening lines. I spent last Wednesday at what is called "The Argyleshire Gathering," or assembling of the clans of the county of Argyle; and if you care to read in hard, unsympathetic prose a record of what took place there, when you can get an outline of the same thing in Clough's sparkling verses very much better done, I shall be glad to give it to you.

And, first of all, I had better tell you of the origin of this gathering and of the locality in which it is held. Argyleshire, as you are aware, is the land of the Campbells. The great Campbell, or "The Maccallum-more," as he is called in this county, is the Duke of Argyll, and four years ago his eldest son, the Marquis of Lorne, married the Princess Louise, the fourth daughter of the Queen; and, as all the Campbells round here tell you, "a proud woman the Queen was, puir leddie, when she married her tochter upon Maccallum-more's son." Besides being the land of the Campbells, Argyleshire is a long straggling county, intersected on all sides by great arms of the sea running far inland, like Norwegian fiords, and separating one lot of Campbells from other lots of Campbells, and all the people who are not Campbells from each other and from the Campbells. It is a picturesque county, and is much haunted by tourists and sportsmen at this season of the year. Its seas are land-locked mainly, and they are frequented by yachts and pleasure-boats of all shapes and sizes and of every construction, very much as they are by herrings and by porpoises which pursue the herrings. The capital of the county is Inverary, where also is the castle of Maccallum-more. But Inverary is but a fishing village, standing at the head of an inland loch leading to nowhere, and visited by no one who has got any other place to visit. Oban, on the other hand, in the northwestern part of the county, is the Charing Cross of the Highlands. Wherever you wish to go, be it to the north or the south or the east or the west, you are pretty sure to find yourself at Oban. It is situated on a beautiful circular bay on the Frith of Lorn—big enough to contain a fleet of yachts; and last Wednesday there were upwards of a score of them at anchor, some being among the finest in the yachting list, and among them the American yacht the *Viking;* and it contains a number of the best-appointed and roomiest hotels in Great Britain. Such being the conditions of the county, an idea presented itself, at the "home-coming" of the Marquis and Marchioness of Lorne four years ago, to some of the many Campbells, that the occasion of the alliance between Maccallum-more's son and a princess of the blood might be utilized so as to bring about friendly relations with the other Campbells and with the county people who were not Campbells, whom, owing to the physical geography of the county, they were unable to visit. It was proposed to establish a gathering of the Argyleshire clans once a year at Oban. Such a scheme, well carried out, could hardly fail to be beneficial to the county. It might tend to promote other alliances, of a humbler character perhaps than that of the great prototype, but if suitably arranged between rich Saxons who invaded the county during the shooting season, and poor Campbells who remained there all the winter, the clan might not be the losers. A Campbell, even when on pleasure bent, preserves a frugal mind. Efforts were accordingly made to start an annual gathering of all the Argyleshire families and their friends. The same sort of thing takes place among the Mackenzies of Inverness-shire at Inverness, among the Duffs and Grants of Aberdeenshire at Braemar, among the Menzies and Stuarts and Macalpines at Blair-Athol, and why not among the Campbells at Oban? Highland sports are carried on at all these places, with prizes to be given away by the lady of the locality to the successful competitors. Balls take place, where everybody who is duly vouched for by some responsible person assembles and makes himself or herself friendly and pleasant. For four years now, as I understand, all Argyle has been in the habit of assembling each year. Highland sports have come off and balls have been given, and the idea thus formulated and carried out has resulted in a complete success.

It was at one of these ceremonials that I assisted last Wednesday; and, if a stranger can form an opinion on so important a subject, I should say that any one who likes Highland sports, and is fond of social gatherings, could not fail to be pleased by what he saw. And what, you may ask, are Highland sports, and in what do they differ from sports that are not Highland? Just as the roaring of a wild stag on the mountains is fiercer and wilder than the bellowing of the domestic bull in a field, so Highland sports are fiercer and wilder than lowland sports, but in other respects they are not dissimilar. Foot-races are run by the Highlanders and the Lowlanders in very much the same way, and high jumping and wide jumping figure in the programme of both peoples. But tossing the caber—*i.e.*, jerking a young tree of the forest in such a way that it performs a complete somersault; throwing the heavy hammer, putting the stone, playing piobairiachids, reels, and strathspeys upon the bagpipes, and dancing the sword-dance over two drawn claymores, at the risk of cutting your feet off by the ankles or gashing the calves of your legs, are pastimes in which none but kilted heroes can take part. These, however, were the rites at which we assisted on Wednesday. They were performed in a fine natural arena, surrounded by rocky terraces like the seats of a Roman amphitheatre, crowded with the natives of Argyle. All the county people were duly assembled, each family bringing their retainers, splendid in kilts and tartans, for the residents who hail from the sunny South like to see their people clad in the weird costume of the North. It was an interesting sight, and, while there is something pathetic in the efforts of the Gael to preserve his wild old rites and ceremonies, you could not help reflecting that much of the show was spurious. The Gaelic race is drifting fast to leeward. The Saxon is too strong and too rich for it. Highland gatherings got up by wealthy South-

erners and supported by them want the true ring of nationality. They may be accurately modelled on the manners and customs of the past, and made to look as like the real thing as possible. But just as it was found impossible, some years ago, to revive even a spark of mediæval feeling in the elaborate attempt to get up a tournament of the olden time in Eglinton-Castle, so here it is impossible to produce much more than a theatrical representation of the barbaric times. Professional caber-tossers and stone-putters with Saxon names win the first prizes over the genuine Celt of the country. Dancing-masters from Glasgow, and bagpipe-players from perhaps still further south, go the round of the various gatherings and carry all before them. But with all these drawbacks—if it be a drawback to fail to reproduce barbaric times—these meetings have their merits. They are social and friendly, and they keep up the old autonomic spirit of the counties and shires in Scotland, and that autonomic spirit is one of the safeguards of the independence of the country, inasmuch as it fosters in the best way possible the idea of local self-government.

## THE LAND QUESTION IN AUSTRALIA.

MELBOURNE, June 14, 1875.

PARLIAMENT has at last met. Although the programme of a weak Ministry is necessarily one of compromise, the political situation is such that we cannot avoid discussing questions of universal interest. Our particular problems just now are the question of abolishing a Second Chamber, or at least making it ineffective; the question of secular education; the question of giving the right to mine on private property; and how to rearrange our land-laws. I do not think there will be much discussion on secular education. It is established; it is a success; and we are not seriously intimidated by a threat from the orator of the Irish Catholics that he will draw "the free and flashing sword" to put it down. Neither, I fear, will the question of reforming the constitution occupy any very prominent place in the debates. In the first place, our Second Chamber, the Council, cannot be commanded to commit political suicide, and will certainly not be cajoled or frightened into it while it is supported by the strong feeling of the moneyed classes in the colony. In the next place, the present Ministry is not supposed to have any convictions, or any even plausible plan. The belief in well-informed circles seems to be that it has arranged to be beaten and withdraw gracefully on this matter, provided the Council will assent to the bill for mining on private property, which, in one form or another, has been repeatedly sent up by the Assembly and rejected by the Council. My own impression, I confess, is that the Council will never pass anything more revolutionary in this direction than a bill to legalize contracts between the land-owner and the miner; that is, to take the property in minerals from the state, and vest it in those who have bought land. A few weeks will show how far I am right. Meanwhile, the question of the Land Bill is before the country, and it will perhaps interest your readers to know what the issues involved are. Our difficulties are, I think, of a special kind.

They began with the gold-diggings, or our sudden burst into great prosperity. Several thousands of men suddenly enriched wanted to invest their savings in land and make themselves homes in their adopted country. Victoria was then divided, under an ordinance of that ingenious theorist Lord Grey, into settled, intermediate, and unsettled districts. The settled districts, which were alone open to ordinary purchasers, comprised about 3,000,000 acres, not quite an eighteenth of the whole area of the country. On 32,000,000 acres of unsettled territory our sheep-farmers, to whom our land had been leased, claimed an absolute right of pre-emption, and a preferable right of occupation on the remainder. Without going into an old question, I may perhaps say that I do not think the squatters' claim was borne out by the strict words of the regulations under which they had rented their land. Still, the incautious policy of Government, denounced at the time by Mr. Robert Lowe, who was then an Australian politician, had no doubt led the sheep-farming class to entertain unreasonable expectations. Hence there has always been in Victoria a strong feeling of bitterness between the squatters or sheep-farmers—who think that they have been illegally deprived of the right to buy up the fee-simple of the colony at a tenth of its value—and the small farmers and laborers, who resented the attempt to exclude themselves from the land, and resent with less justice the large fortunes which the sheep-farming interest has made in virtue of early and inexpensive settlement. Practically, therefore, every Land Bill since the democratic element has become ascendant represents the determination of the working-classes not only to secure themselves a supply of cheap land, but to keep the large landed proprietors from increasing their actual estates. An American will perhaps find it difficult to understand why any legislation should be required beyond throwing the land open to all in large quantities. But Victoria presents a combination of several unusual circumstances: a small proportion of really fertile land and a most unusual reserve of capital seeking investment. Less than half the colony is supposed to be really fit for occupation; and of this 10,000,000 acres have been sold, while about 15,000,000 remain to be disposed of. Were these thrown open indiscriminately for selection at £1 an acre, or sold at auction to the highest bidder, there is no doubt that in five years nine-tenths of them would have been taken up by a few hundred rich men enjoying the confidence of the banks, and that the small proprietors of the remainder would be bought out in about five years more. An economist of the English school of course argues that the state has nothing to do with the position or numbers of those who buy land from it, and has no business to interfere with the natural prerogative of capital to employ itself as it likes best. The great majority of Australians, however, are firmly determined that the land shall not be monopolized by a few rich men. We prefer French subdivision to the large estates of the English gentry; and we prefer it the more as the rich men have not struck root in the country, are often absentees, and never cordially democratic.
